The importance of these considerations is well shown by the discussion now going on about a third term, under the somewhat silly name of "Cæsarism." Everybody knows that all talk of the establishment of anything resembling Cæsarism, whether that of Rome or that of Paris, is simply an amusing way of filling newspaper columns during the dull season. There never was, and never can be, Cæsarism of any sort without a large standing army, and in the absence of a large standing army no number of re-elections would do much to change the character of the Presidential office. What one has to ask himself in considering the re-election of General Grant or any one else to a third term is not, do we run the risk of establishing a despotism? but, are the influences which the present holder of the office fosters, either by his favor or society, and which, taken altogether, constitute what is called a "régime," such as it is desirable to strengthen and prolong? For the influence of the White House on the political class is a very powerful thing. It makes or mars men's political fortunes; it keeps them before the public eye or consigns them to obscurity; it often gives them a chance of showing of what stuff they are made, or condemns them to grumbling inactivity. In other words, it has the power very largely of creating a political atmosphere, and directing political ambition. It is safe to say, for instance, that General Grant, by his mode of filling the Treasury Department during the last five years, might have created a totally different ideal of a finance minister and financial policy from that with which the public mind is now filled. We might multiply these illustrations indefinitely.

Now, when we are considering the desirableness of prolonging a régime, we have to take into account its relations to the evils of the day. If it seems such as to foster in any way what is bad or dangerous in existing tendencies, we shall have little difficulty in deciding that a change of some kind is necessary. The worst and most dangerous thing in existing tendencies, both in political and social life, is the tendency to throw successful "operators" to the surface of American society, and give them the control, covert or open, of the national affairs. When one comes to consider who the men are who have pushed to the front during the last ten years, and are now sufficiently conspicuous to be talked of as candidates for the Presidential chair or for any of the higher honors of the state, they are, with two or three exceptions, either audacious and wealthy operators or men who work under their control, if not in their pay. Those fields of activity in which success is won by eloquence, or knowledge, or disinterested application to public affairs—the bar, the press, the pulpit, the legitimate walks of commerce and industry—hardly send a single noteworthy candidate into the political arena.

The bearing of all this on the events of the day in the commercial and financial world we need not point out. We will mention one fact in illustration of this relation, however, and that is, that one of the prominent causes of the panic by which this great commercial city is at this moment convulsed is admitted to be the refusal of English investors to take our railroad and other bonds, though London is teeming with unemployed capital, and though, after all, there is no such security not governmental now offered anywhere as the great mass of American railroad bonds undoubtedly are. Now, the thing which has perhaps more than anything else helped to create this distrust, is the fact that the American Minister in London has, apparently without a word of rebuke from his Government, helped to carry out the most outrageous swindle perpetrated there for many years, in allowing himself to be made a director of the Emma Mine long enough to enable the fraud to be completed.

PANICS.

IT is impossible to see, much less experience, a financial panic without an almost appalling consciousness that a new and terrible form of danger and distress has been added in comparatively recent times to the list of those by which human life is menaced or perplexed. Any one who stood on Wall Street, or in the gallery of the Stock Exchange last Thursday, and Friday, and Saturday, and saw the mad terror, we might almost say the brute terror (like that by which a horse is devoured who has a pair of broken shafts hanging to his heels, or a dog flying from a tin saucepan attached to his tail) with which great crowds of men rushed to and fro, trying to get rid of their property, almost begging people to take it from them at any price, could hardly avoid feeling that a new plague had been sent among men, that there was an impalpable, invisible force in the air, robbing them of their wits, of which philosophy had not as yet dreamt. No dog was ever so much alarmed by the clatter of the saucepan as hundreds seemed to be by the possession of really valuable and dividend-paying securities; and no horse was ever more reckless in extricating himself from the *débris* of a broken carriage than these swarms of acute and shrewd traders in divesting themselves of their possessions. Hundreds must really, to judge by their conduct, have been so confused by terror and anxiety as to be unable to decide whether they desired to have or not have, to be poor or rich. If a Roman or a man of the Middle Ages had been suddenly brought into view of the scene, he would have concluded without hesitation that a ruthless invader was coming down the island; that his advanced guard was momentarily expected; and that anybody found by his forces in possession of Western Union, or Harlem, or Lake Shore, or any other paying stock or bond, would be subjected to cruel tortures, if not put to death. For neither the Roman nor the Mediæval could understand a rich man's being terrified by anything but armed violence. Seneca enumerates as the three great sources of anxiety in life the fear of want, of disease, and of oppression by the powerful, and he pronounces the last the greatest. If he had seen Wall Street brokers and bankers last week trying to get rid of stocks and bonds, he could not of course have supposed that they were poor or feared poverty; he would have judged from their physical activity that they were in perfect health, so that he would have been driven to the conclusion that some barbarian host commanded by Sitting Bull or Red Cloud was entering the city, and was breathing out threatenings and slaughter against the owners of personal property. If you had tried to explain to him that there was no conqueror at the gates, that the fear of violence was almost unknown in our lives, that each man in that struggling crowd enjoyed an amount of security against force in all its forms which no Roman Senator could ever count upon, and that the terror he witnessed was caused by precisely the same agency as the flight of an army before it has been beaten, or, in other words, by "panic," he would have gazed at you in incredulous amazement. He would have said that panic in an army was caused by the sudden dissolution of the bonds of discipline, by each soldier's losing his confidence that his comrades and his officers would stand their ground; but these traders, he would have added, are not subject to discipline; they do not belong to an organization of any kind; each buys and sells for himself; he has his property there in that tin box, and if nobody is going to rob him, what is frightening him? Why is he pale and trembling? Why does he run and shout and weep, and ask people to give him a trifle, only a trifle, for all he possesses and let him go?

If you were then to set about explaining to Seneca that the way the god Pan worked confusion in our day in the commercial world was by destroying "credit," you would find yourself brought suddenly face to face with one of the most striking differences between ancient and modern, or, even as we have said, mediæval society. The most prominent and necessary accompaniment or incident of property in the ancient world was possession. What a man owned, he held. His wealth was in his farm, or his house, or his granary, or his ships. He could hardly separate the idea of property from that of possession, and the state of society strengthened the association. The frugal man hoarded, and when he was terrified, he buried his money, a practice to which we owe the preservation of the greater portion of the old coins now in our collections. The influence of this sense of insecurity, of the constant fear of invasion or violence, lasted long enough in all Continental countries, as Mr. Bagehot has recently pointed out, to prevent the establishment of banks of issue until very lately. The prospect of war was so constantly in men's minds that no bank could make arrangements for the run which would surely follow the outbreak of hostilities, and, in view of this contingency, nobody would be willing to hold paper promises to pay in lieu of gold and silver. It is therefore in England and America, the two countries possessing not only most commercial enterprise, but most security against invasion, that the paper money has come into earliest and widest use. To the paper of the banks have been added the checks and bills of exchange of private individuals, until money proper plays a greatly diminishing part in the operations of commerce. Goods are exchanged and debts paid by a system of balancing claims against claims, which really has almost ceased to rest on money at all. So that a man may be a very rich man in our day, and have really nothing to show for his wealth whatever. You go to his house, and you find nothing but a lot of shabby furniture. The only thing there which Seneca would have called wealth is perhaps his wife's jewels, which would not bring a few thousand dollars. You think his money must be in the bank, but you go there with him and find that all he has there is a page on the ledger bearing his name, with a few figures on it. The bank bills which you see lying about, and which look a little like money, are not only not money in the sense Seneca understood the term, but they do not represent over a third of what the bank owes to various people. You go to some safe-deposit vaults, thinking that it is perhaps there he keeps his valuables, but all you find is a mass of papers, signed by Thomas Smith or John Jones, declaring that he is entitled to so many shares of some far-off bank, or that some railroad will pay him a certain sum some thirty years hence. In fact, looked at with Roman eyes, our millionaire seems to be possessed of little or nothing, and likely to be puzzled about his daily bread.

Now, this wonderful change in the character and incidents of property may be said to be the work of the last century, and it may be said to consist in the substitution of an agency wholly moral for an agency wholly material in the work of exchange and distribution. For the giving and receiving of gold and silver, we have substituted neither more nor less than faith in the honesty, and industry, and capacity of our fellow-men. There is hardly one of us who does not literally live by faith. We lay up fortunes, marry, eat, drink, travel, and bequeath, almost without ever handling a cent; and the best reason which ninety-nine out of every hundred of us can give for feeling secure against want, or having the means of enjoyment or of charity, is not the possession of anything of real value, but his confidence that certain thousands of his fellow-creatures, whom he has never seen, and never expects to see, scattered, it may be, over the civilized world, will keep their promises, and do their daily work with fidelity and efficiency. This faith is every year being made to carry a greater and greater load. The transactions which rest on it increase every year in magnitude and complexity. It has to extend itself every year over a larger portion of the earth's surface, and to include a greater variety of race, and creed, and custom. London, and Paris, and Berlin, and Vienna now tremble when New York is alarmed. We have, in short, to believe every year in a greater and greater number of people, and to depend for our daily bread on the successful working of vast combinations, in which human character is after all the main element.

The consequence is that, when for any reason a shade of doubt comes over men's minds that the combination is not working, that the machine is at some point going to give way, that somebody is not playing his part fairly, the solid ground seems to shake under their feet, and we have some of the phenomena resulting from an earthquake, and among others blind terror. But to any one who understands what this new social force, Credit, is, and the part it plays in human affairs, the wonder is, not that it gives way so seldom, but that it stands so firm; that these hundreds of millions of laborers, artisans, shop-keepers, merchants, bankers, and manufacturers hold so firmly from day to day the countless engagements into which they enter, and that each recurring year the result of the prodigious effort which is now put forth in the civilized world in the work of production, should be distributed with so much accuracy and honesty, and, on the whole, with so

much wise adjustment to the value of each man's contributions to civilization.

There is one fact, however, which throws around credit, as around so many others of the influences by which our lives are shaped, a frightful mystery. Its very strength helps to work ruin. The more we believe in our fellow-toilers, and the more they do to warrant our belief, the more we encourage them to work, the more we excite their hopefulness; and out of this hopefulness come "panics" and "crashes." Prosperity breeds credit, and credit stimulates enterprise, and enterprise embarks in labors which, about every ten years in England, and every twenty years in this country, it is found that the world is not ready to pay for. Panics have occurred in England in 1797, 1807, 1817, 1826, 1837, 1847, 1857, and there was very near being a very severe one in 1866. In this country we have had them in 1815, 1836, and 1857, and by panics we do not mean such local whirlwinds as have desolated Wall Street, but widespread commercial crises, affecting all branches of business. This periodicity is ascribed, and with much plausibility, to the fact that inasmuch as panics are the result of certain mental conditions, they recur as soon as the experience of the previous one has lost its influence, or, in other words, as often as a new generation comes into the management of affairs, which is about every ten years in the commercial world both in England and here. The fact that this country seems to be only half as liable to them as England, is perhaps due to the fact that the extent of our resources and the greater ratio of increase of population make it much harder to overdo in the work of production here than in England, and to this must be added the greater strength of nerves produced by greater hopefulness. In spite of the enormous abundance of British capital and the rashness of the owners in making investments, there hangs over the London money market a timidity and doubtfulness about the future which is unknown on this side of the water, and which very slight accidents develop into distrust and terror. If this theory be correct, our next great panic will be due about the year 1877, immediately after the Centennial Exposition. Let us hope, however, that the present slight attack may inspire enough prudence and good sense to ward it off.

Correspondence.

THE MASSACHUSETTS CONVENTION.

To the Editor of the Nation:

Sir: Perhaps you may like an account, from another point of view, of our State Convention, which a spirit of enquiry led me to attend. Why was it that a man with the character and antecedents of General Butler should have secured the support of so large a section of the proverbially sober and conservative people of Massachusetts; that he should have been able to alarm the respectable class so thoroughly as to induce them to put forth unusual efforts? Conversation with Butler delegates, whom it is a mistake to class, as a whole, with the lower and reckless element, furnished a good deal of light upon the subject. They are tired of what they call the "ring"—that is, of being marched up in platoons to vote for a set of names furnished by a committee—names which have no meaning for them, which are not connected with any public achievement, nor with the set of meaningless platitudes, as Butler justly designated them, which are called resolutions.

Eliminate the Butler element from the proceedings on the 10th inst., and it is impossible to conceive a more complete mummery and farce. The pen of Carlyle would gloat over such sham and unreality. Gov. Washburn has filled the chair for two years. What has he done to justify a third election? That he is an honest man and a Christian gentleman may be very true; but these qualities, though their absence may be deplored, never excite positive emotions. If it is said that no Governor can do any more, I reply that this is exactly the point. The Governor of this commonwealth is a mere figure-head, the executive officers are simple head-clerks; and to hold caucuses all over the State, and send a thousand such men as were assembled in Mechanics' Hall, for the mere purpose of expressing approval of a list of clerks furnished by a committee, borders very closely on the ludicrous. There is nothing more dangerous, more subversive of honesty and earnestness in politics, than to allow a people to feel that their most solemn public acts are shallow forms without any real meaning. Nothing contributed more to the destruction of Rome than solemn religious shams which everybody knew to be such.

Nor do the resolutions help the matter much. They are the purest generalities, framed to cover the greatest number of individual opinions, in which they are so far successful that, with the change at pleasure of the words Republican and Democrat, and saving the personal endorsement of President Grant, there is not probably an adult man in Massachusetts who would get up and publicly oppose them. But however that may be, what is the personal relation of the list of State officers to these resolutions? What effect will the election of Gov. Washburn have upon the subject of Congressional back-pay, upon intimidation of Federal office-holders, upon railroad legislation by Congress, upon the achievements of the National Administration? Even in State affairs, the Governor has nothing to do with legislation or its effects, as the resolutions practically declare when they confine their praise of him to his "good sense, fidelity, uprightness, and watchfulness for the public welfare," the sort of certificate which a man gives his book-keeper to help him to a place. The fact is that the Legislature has completely swallowed up the Executive; and as this branch is the only one elected by the whole State, the elective functions of the whole State have been reduced to an empty form. The French peasants, who vote under the direction of the prefect, are not more completely under dictation than the delegates to a State Convention; and the people of Massachusetts, being of somewhat different material, get impatient.

Here, then, is the strength of General Butler. He is much blamed for putting himself forward as a candidate and sounding his own praises. But this is what Gladstone and Disraeli and all the members of the British Parliament do all their lives. Nothing could be more thoroughly offensive, not to say disgusting, than General Butler's closing speech. But this only makes the case so much stronger. People want to see and hear their man, and, rather than not do it, they will take such stuff as we heard. Governor Washburn has been praised for keeping out of the canvass. If he could have come forward and told of work done in the Hoosac Tunnel case, in poor-law and sanitary reforms, in adjustment of taxation, in codification of laws, etc., he would have beaten his opponent out of the field. But Gov. Washburn knows that he has done and can do none of these things. *He* cannot say, "I am an honest man and a Christian gentleman." He has nothing else to say; and so he leaves the field to one who does not consider performance a necessary sequel to promises. The gentlemen who spoke against Butler were his superiors in almost every respect; but they had nothing real to talk about, and they could not equal him in brag and bluster.

If it is said, as many do say, that it is only a change of offices that is wanted, it does not alter the case. If the chief executive position in Massachusetts involves only a disposal of offices, then a desire for change, on the part of the outs, is quite natural. The strength of the Executive should lie in something else. If the people of Massachusetts felt that he was doing their work well, it would take more than a few hungry office-holders to displace him, especially as the actual incumbents would operate as a neutralizing force.

The moral of all this I take to be that the Executive should be restored to a position of some positive power and positive responsibility; that he should go to the people upon a definite statement of his merits in office and not in private life; that any candidate should be free to contest his claim to these merits; and that by such methods alone can spectres like Butler be effectually exorcised. G. B.

Boston, September 12, 1873.

Notes.

THE first volume of a translation of Alzog's 'Manual of Universal Church History,' 9th edition, by Dr. F. J. Pabisch, of Cincinnati, Ohio, is in the press of Robert Clarke & Co. The work is published by subscription at $4 a volume, to be completed in three volumes (each with its chronological table and table of contents, besides the general index at the end) in the course of two years.——Further announcements by Macmillan & Co. are as follows: 'Drummond of Hawthornden,' by Professor Masson; 'Cobden and Political Opinion,' by J. E. Thorold Rogers; 'Sir Joshua Reynolds and his Works,' by J. C. Collins, illustrated with autotype copies of engravings of distinguished beauties of the Court of George III.; 'The Sources of Standard English,' by T. L. Kington-Oliphant; 'The Friendship of Books, and Other Lectures,' by the Rev. F. D. Maurice; 'Cave-Hunting,' by W. Boyd Dawkins—researches on the evidence of caves respecting the early inhabitants of Europe; 'On the Theory of Sound,' by Lord Rayleigh; 'On Some Influences of Christianity upon National Character,' by the Dean of St. Paul's; and a translation, by Rev. W. Benham, of Thomas à Kempis's 'Imitation of Christ,' printed with borders in the ancient style after Holbein, Dürer, and other old masters.——Part 15 of Stieler's Hand-Altas contains a beautiful map of the mountain and river system of Germany and adjacent countries; a map of Russia and Scandinavia; and a map of Eastern Europe, from Hamburg to St. Petersburg (New York: L. W. Schmidt).

—We continue our selections from the fall announcements of American publishers. Harper & Bros. will publish 'Among Our Sailors,' by Dr. J.

Gray Jewell; 'Hints and Helps in Pastoral Theology,' by Rev. W. S. Plumer, D.D.; Principal Dawson's 'Story of the Earth and Man'; Smiles's 'Huguenots in France after the Revolution'; and the 'Memoirs and Letters of Sara Coleridge.'——Henry Holt & Co. will reprint Taylor's 'Primitive Culture' and 'Early History of Mankind,' and Strauss's 'Old Faith and the New'; together with Taine's 'Tour in the Pyrenees,' illustrated by Doré, and his 'English Literature' in four 12mo volumes.——Hurd & Houghton announce Charles Blanc's 'Grammar of Painting and Sculpture,' translated by Mrs. Kate N. Doggett; Mrs. Clement's 'Handbook of Painters, Sculptors, Architects, and Engravers'; 'Ballads for Little Folks,' from the poems of the Cary sisters; the 'Egyptian Sketch-book,' by Charles G. Leland. ——Sheldon & Co. collect into a volume Gen. Custer's articles in the *Galaxy* on 'Life on the Plains.'——The most important of D. Appleton's forthcoming publications is Paul Lacroix's 'Manners and Customs of the Middle Ages.' They have also in press: Herbert Spencer's 'Study of Sociology'; 'Civilization considered as a Science,' by George Harris, F.S.A.; 'Science and Religion,' by Prof. Joseph Leconte; Charan's 'Comparative Anatomy of Domestic Animals'; 'Locomotion of Animals,' by Dr. B. G. Bell Pettigrew; and an illustrated 'School History of Germany,' by Bayard Taylor. ——From Cassell, Petter & Galpin we are to have 'Principles of Decorative Design,' by Christopher Dresser; and 'Half-hours with Early Explorers,' by T. Frost.——'The Alhambra and the Kremlin,' a journey from Madrid to Moscow, by S. Irenæus Prime; and 'Aspects of Authorship; or, Bookmarks and Bookmakers,' by Francis Jacox, will be published by A. D. F. Randolph & Co.——A real acquisition will be Maetzner's 'English Grammar,' of which a translation is announced by Roberts Bros., Boston. They also announce the following: Lessing's 'Laocoön,' translated by Miss Ellen Frothingham; Eugène Plon's 'Thorvaldsen'; two works by P. G. Hamerton—'Thoughts about Art' and 'Chapters on Animals'; A. J. C. Hare's 'Records of a Quiet Life'; Joaquin Miller's 'Songs of the Sun Land' and John Boyle O'Reilly's 'Songs from the Southern Seas'; and Margaret Fuller's Works.——In addition to Nast's Almanac (Harpers) and Josh Billings's Alminax, it seems we are to have the *Danbury News* Man's Almanac (Shepard & Gill).——Robert Clarke & Co. have in press, in continuation of their reprint of Legal Classics, Christopher St. Germain's 'Doctor and Student' (1518–1530), and Sir John Fortescue's 'De Laudibus Legum Angliæ' (reign of Henry VI.). Montesquieu's 'Spirit of Laws' forms the first of the series, and has already appeared, in two volumes.

—It is due to Professor Atherton, of Rutgers College, to say that the manner in which we grouped his name with that of Dr. McCosh in a recent article on American Colleges and Legislators (*Nation*, No. 426), may mislead those of our readers who have not read his very able and instructive address before the National Educational Association at Elmira into the belief that he, like Dr. McCosh, took ground against the agricultural colleges. On the contrary, the only statements in the article which should be attributed to Professor Atherton are those which relate to the startling proportion of downright ignorance and illiteracy now existing in the United States, and he, it should be understood, is really the strongest advocate we have met with on the side of the Congressional endowments. We have received from Professor Atherton a communication, accusing us of misstatements and mistakes in the brief introductory paragraph of the article alluded to, which we are debarred from publishing, partly by its length, partly because the paragraph referred to was intended and professed to be little more than a *résumé* of the statements of Dr. McCosh, and partly because we do not wish at this time to be drawn into the controversy on the merits and demerits of the system of appropriations for these colleges. The offending paragraph was introductory to an article on an entirely different subject, and its expressions were neither so precise nor so guarded as they probably would have been if we had been treating of this matter of the colleges. It is proper to add that instead of saying that Cornell has received under the act of 1862 nine hundred thousand *dollars*, we should have said *acres;* and instead of using language so ambiguous as to imply to readers who do not know any better that Cornell's only return for the endowment is a dividend of two agricultural graduates a year, it would have been better to have quoted Dr. McCosh literally, and said that "it graduated two agricultural students in June last," with a proper reference to its much larger Mechanical Department. But we shall probably take up the subject hereafter, and will then endeavor to deal more justly with it and with Professor Atherton's communication.

—Circular of Information No. 3 of the Bureau of Education is a digest of the proceedings at the various college commencements in New England, New York, New Jersey, and Pennsylvania—at least of such as were published in the newspapers last summer, embracing 54 institutions in all. The design of this compilation is so good that it is a pity the execution is not equally to be praised. The editor has not confined himself simply to a colorless abstract of the speeches and addresses delivered, but, as if to illustrate the propagandist function of the Bureau, ventilates its or his own opinions and theories wherever it suits him. Thus, "it was gratifying" to him to hear (by a justifiable fiction) at Colby University "most emphatic commendation of the old system of thorough training as heretofore maintained at this college, in opposition to the 'elective' systems now becoming popular in our collegiate institutions." At Cornell, Mr. Charles Dudley Warner's address on "Progress" "appears to have been a neat and happy answer to the scepticism of both Froude and Ruskin as to the real and material progress in our day." At Williamstown, Mr. David Dudley Field closed the debate on the admission of women to the college "with a strong appeal for equality and progress, and a trenchant refutation of the fears of conservatism"; while President Chadbourne delivered a discourse "intended as a reply to the Darwin school and the atheistic teachings of the day"—the two things being evidently one in the mind of the editor. With this gentleman's perspective it is less profitable to find fault than with his bias as a reporter; still it is noticeable how much space and attention are bestowed on one and the same oration of a "new and rising man," delivered at two separate commencements. And finally (by way of criticism), we must remark the compiler's neglect to give in every case the date of the college exercises.

—The value of the Circular lies, of course, mainly in its statistics, and if the Bureau should take pains another year to collect these by means of a uniform blank addressed to the proper authorities, the result would be indeed worthy of preservation. Two features already are highly interesting even if incomplete. One is the bibliography of each college for the year—not very imposing, to be sure, though it includes any work published by a college officer. The other is the list of benefactions. These are not always clearly distinguished according to their object, and the amounts are nowhere tabulated and summed up. We have had the curiosity to do this for ourselves. It appears that nearly a million of dollars (say $979,500) were given to the New England colleges; something less (say $836,500) to those of New York and New Jersey; and about $54,000 to those of Pennsylvania, whose deficiency is very marked, all the more when it is considered that the sum named must be divided among a dozen institutions reported in the Circular. The grand total of nearly two millions ($1,870,000) certainly falls short of the full extent of private liberality for the promotion of the higher education in the States enumerated; but it is large enough to maintain the American reputation for wise and generous giving, even if we omit all that the year has recorded in the rest of the country. The question of admitting women to Williamstown was warmly argued, but decisively negatived. At Harvard, as is well known, steps were taken to institute examinations for women like those so successfully carried on at Cambridge, England. The authorities of Swarthmore College, Pennsylvania, express their perfect satisfaction with the experiment of coeducation as thus far tried by them. At Lafayette College, Easton, there has been established "an additional course in the classics, in which the Latin and Greek of Christian authors only are read." This was done "to meet the objection that some entertain against placing the heathen classics in the hands of students on account of their demoralizing influence." Trinity College, Hartford, is to be congratulated (we hope not alone) on the fact that its new buildings are to be constructed from designs by Mr. Burges, the eminent English architect.

—We have received lately some interesting circulars from "The New Geographical Society or People's National Institute" of England, which may be of interest to publishers of school-books and to seafaring men. This new society aims at destroying the widespread delusion that the earth is a globe—a delusion which, according to the Prospectus, is "a gigantic and pernicious system of infidel superstition, falsehood, and fraud—a system of chicanery and delusion which the inventors themselves derided and disowned, and declared that 'none but fools would believe in it as the truth'—a system which has robbed this nation alone of millions of pounds, and has been the cause of all the infidelity and scepticism which has ever existed since these theories were first broached." The circulars throw but little light on the method of these bold innovators, but, as far as can be judged, they rest their case on texts from the Bible, such as Joshua x. 13, Isaiah xiii. 13, xxxviii. 8, etc., and on common sense, as it is called. For instance:

"Special attention is requested to the startling fact that the 'dip of the horizon' *must* be a purely fanciful idea, because no distant object, beyond the horizon, on land or water, can be seen through a telescope or tube deflected a single inch from an adjusted 'level'! From the top of the highest known elevation in the world, the rising and the setting sun, which is said by the Newtonian theorists to divide, diametrically, the 'hemisphere' of light from the 'hemisphere' of darkness, and consequently must be, even then, 4,000 miles below a tangent cutting the apex of either 'hemisphere,' *cannot be seen* if the tube or telescope is deflected an inch from or below the most accurate 'level' that can be secured!!"

Poetry, too, aids the investigator:

> "*Come!* tell us, first, then, *how it is*, whatever else betide,
> That water can be level and yet convex be-side!
> How 'tis that rivers always flow to the level of the sea,
> And yet the earth, o'er which they run, in form a globe can be.
> Then tell us how it is that—having side and bottom—
> This globe retains the people who are elsewhere than the top on."

Any one who is curious in this matter, and especially the students of "Alwato," we will refer to the secretary and manager, John Hampden, Esq., Kerby Road, Tamworth Road, Surrey—the same gentleman who lost a wager with Mr. Alfred R. Wallace in a crucial test of the globular hypothesis. Mr. Hampden also says: "We have another secret; but as it does not concern and has no sort of reference to God's cause or God's glory, we shall not part with it for nothing. It concerns only the *wealthy* classes, whatever their station in life may be. Our charge will be, therefore, fifty-two pounds ten shillings from each individual to whom we impart the caution, and whom we are satisfied will profit, if they choose, by our advice." Mr. Hampden's grammar is very like his astronomy.

—It is to courts of justice that one naturally looks to give authoritative sanction to the true conception of property, and in two recent cases, simultaneously decided by the Supreme Court of New Hampshire, we find a good illustration of the way in which this ought to be done. The facts in the two cases (Eaton *v.* B. C. & M. R. R.; Aiken *v. ib.*, 51 N. H. Reports, 504) are substantially the same. The plaintiffs were the owners of two farms, consisting of meadow-lands lying on a river; northerly of these farms there was a narrow ridge of land some twenty-five feet high, extending from high lands on the east westerly to the river, protecting the meadows from the effects of floods and freshets in the river, which, as every one knows, are apt to be dangerous to New England meadow-land. Through this ridge the Boston, Concord, and Montreal Railroad, in constructing their road, made a deep cut, through which the waters of the river sometimes flowed in time of freshets, carrying sand, gravel, and stones upon the plaintiffs' meadows. It was for this damage that the suits were brought. Probably to most readers it will be difficult to imagine what the defence of the road was; but, nevertheless, the defence was a very simple one. There were several questions involved, but the decision really turned on a single point. In almost all the State constitutions there is a provision forbidding the "taking" of "private property" for public use under legal authority, as by a railroad, turnpike, or canal corporation, without just compensation. In New Hampshire, although the constitution does not expressly contain this clause, it has always been held by the courts that such a restriction is part of the law of the State as much as if it was down in black and white. The defendant railroad contended that inasmuch as it had not "taken" any of the plaintiffs' meadows, the latter could not recover damages; and singular as it may seem, there has been a sufficiently general tendency in the courts to construe the provision in this way to warrant the defence. As Judge Smith, who decided these cases, said in his opinion, courts have maintained that to constitute a "taking of property" there must be "an exclusive appropriation," a "total assumption of possession," a "complete ouster," an absolute or total "conversion of the property," a "taking the property altogether"—a construction which certainly renders the constitutional safeguard of little worth, being interpreted much as if it read, "No person shall be divested of the formal title to property without compensation, but he may, without compensation, be deprived of all that makes the title valuable."

—The vital question evidently is, What is the meaning of the mysterious word "property"? And this question the court proceeds to examine, coming to the conclusion that property is not the *thing*, but the right of the owner to possess, use, enjoy, and dispose of a thing. The ownership of real estate consists, among others, of the right to build, the right to drain, the right to exclude trespassers, the right to lease, the right to profits, the right to sell or mortgage; in short, the general right to use. "From the very nature of these rights of user and of exclusion, it is evident that they cannot be materially abridged without *ipso facto* taking the owner's 'property.'" If in these cases the plaintiffs' meadows, instead of being occasionally, had been perpetually, submerged (as might easily have been the case if this land had been near the sea, and the ridge had been a dyke), the rights we have enumerated would not merely have been interefered with; they would have been absolutely gone, and yet, according to the common construction of the clause, no property would have been taken.

"Restricting A's unlimited right of using one hundred acres of land to a limited right of using the same land, may work a far greater injury to A than to take from him the title in fee-simple to one acre, leaving him the unrestricted right of using the remaining ninety-nine acres. Nobody doubts that the latter transaction would constitute a 'taking of property.' Why not the former? If, on the other hand, the land itself be regarded as 'property,' the practical result is the same. The purpose of this constitutional prohibition cannot be ignored in its interpretation. The framers of the constitution intended to protect rights which are worth protecting; not mere empty titles, or barren insignia of ownership, which are of no substantial value. If the land, 'in its corporeal substance and entity,' is 'property,' still all that makes this property of any value is the aggregation of rights or qualities which the law annexes as incidents to the ownership of it. The constitutional prohibition must have been intended to protect all the essential elements of ownership which make 'property' valuable."

The case, which is of a good deal of importance, was decided for the plaintiffs. The New Hampshire Supreme Court is an old-fashioned, conservative court, one of those least likely of all in the country to be led away by popular clamor against railroads to render decisions opposed to law. This opinion will no doubt surprise most lawyers who have been educated in the belief that the construction of the constitutional safeguard here repudiated was the correct one; but we believe in the long run the opinion of Judge Smith will hold its own. It is not difficult to see the connection between such cases as this and those more general questions relating to property which now agitate everybody's mind.

—'The Part taken by the German Universities in the War with France' is the title of a work by Ludwig Bauer, stud. jur., lately published at Leipzig. The statistics contained in it are confessedly imperfect, and no doubt fail to do entire justice to the patriotic devotion of the "akademische Jugend" of the Fatherland. In the summer semester of 1870 the universities counted 13,765 matriculated students, of whom 4,510, or nearly one-third, took part in the war as combatants or non-combatants (*Krankenpfleger*). This proportion would appear still higher, if from the first total were subtracted the non-German students, whose numbers were not insignificant. There died of wounds or disease 258, of whom 63 belonged to Leipzig, though her contingent was but 500 (400 combatants). Berlin lost but about one in twenty (30 out of 582); Göttingen one in fifteen (23 out of 340); Halle one in seventeen (19 out of 326); Jena one in twelve (13 out of 159); Munich one in eighteen (21 out of 370), etc., etc. Out of 1,505 university professors, doctors, and assistants, 15 bore arms and 253 devoted themselves to the care of the wounded, while 120 made themselves more or less conspicuous by the encouragement which they gave to the national cause by their speeches and writings. Four of the former fell victims of the war, either on the field of battle or in the hospitals. Herr Bauer's work derives added value from the fact that he gives selections from the more important addresses, essays, and pamphlet literature evoked by the war, such as Professor Dove's reply to the Dublin University's appeal to the Germans to protect works of art in the bombardment of Paris; Mommsen's less lucky attempt to conciliate Italian sympathies; Professor Weber's letter to Professor A. de Gubernatis; Von Raumer's effective response to Guizot, and Strauss's to Renan. Nor is the poetry of the period omitted from this memorial, though its preservation was certainly not of the last importance.

SYSTEMS OF CONSANGUINITY AND PRIMITIVE MARRIAGE.*

I.

MANY sciences, and some of those which are purely physical, seem to converge in anthropology. The study of language and comparative philology finds its grandest results in displaying the origin and relations of races; the transmission of words and linguistic forms marking the migration and kinship of peoples. Even the geologist, by his explorations of bone caverns and flint-tool deposits, carries us back to the prehistoric periods of mankind, and gives us a glimpse, brief but vivid, of the primitive savage state. Language and its relations with man and history have long been studied; the earth's rocky crust has been diligently explored; physiological investigations and speculations have been pursued with an ardor and freedom which perhaps have sometimes confounded hypothesis with fact. At length a new field of research and discovery has been entered upon, a new direction given to the activities of science—the comparative study of institutions. This phase of anthropological science has no direct relations nor connections with political history; it deals with the institutions of mankind prior to the state and to legislation. It will doubtless become a distinct department of the more comprehensive science, and more important even than comparative philology, because it would seem that some of these institutions possess elements of durability more marked than those which belong to words and grammatical forms, and that they can therefore indicate more clearly than language the affinities and aboriginal relations of races. Among the laborers in this special field are Max Müller in his essays upon comparative mythology, Sir John Lubbock in his studies of savage life, and Mac-

* 'Systems of Consanguinity and Affinity of the Human Family. By Lewis H. Morgan, LL.D.' Smithsonian Contributions to Knowledge, No. 218.

Clellan in his monograph upon primitive marriage. The work of Dr. Lewis H. Morgan in this direction is, however, by far the most fruitful in new and important results. Purely scientific in its methods and its singleness of purpose, it has fairly shown the study of social institutions independent of history to be a separate and distinct sub-department of enquiry and knowledge. While other writers have speculated, he has, through years of patient toil, collected a vast mass of facts upon which others as well as he may base their conclusions as to the primitive condition of the human race. The particular object of his research is the systems of kinship, or, to use the technical terms borrowed by us from the later Roman law, of consanguinity and affinity, which have prevailed or which now exist throughout the world—a subject apparently narrow enough, but which, as we shall see, branches out into all the institutions of society, and, indeed, is vitally connected with the very being of society itself. While prosecuting a study of the language and customs of some American Indian nations, Dr. Morgan was struck with certain peculiarities of family relationships which formed a part of their strange life. Further examination established the fact that this peculiar method was a general law among the American Indians. An awakened and scientific curiosity led him to extend a special investigation upon this subject over a broader field, and if possible to include all the peoples of the world within its range. To this end, he prepared a schedule of questions describing the persons in the lineal and in the first five collateral lines, which, when answered, would give their relationship to the *ego* represented as asking the questions. This schedule was sent to American missionaries in all parts of the world, to English missionaries, to American foreign ministers and consuls, and to private persons interested in science, for the purpose of obtaining written answers to the questions from intelligent natives given in their own language. In this manner the national systems prevailing in Asia and in the Pacific islands were obtained; those of Europe were furnished by competent scholars in the different countries; while Mr. Morgan pushed his researches personally among the Indians of the West. The positive results are classified and arranged in tables, and are explained and illustrated in descriptive chapters. The Smithsonian Institution has published the whole among its contributions to knowledge in a large quarto volume, containing 700 pages. Sir John Lubbock, in a discourse expressly delivered upon the book before a learned London society, though differing from Mr. Morgan in some of his theories, pronounced the work to be the most important addition to ethnological science which had been made for several years. We purpose in this article to give an outline and abstract of its principal features, its most important facts and discoveries.

We are so familiar with the relationships of consanguinity which prevail among ourselves and the European nations, and they seem so natural and necessary, that it may be hard perhaps to conceive of any other and different ones. Mr. Morgan shows, however, that over all parts of the world, among peoples widely separated in geographical position, language, and apparently race, there are other systems entirely unlike our own, but identical or having strong analogies with each other—systems not only unlike our own in their details, but which must have been based upon some original marriage and family institutions radically different from, and in fact antagonistic to, the modern marriage and the modern family. The two grand systems he appropriately calls the Descriptive and the Classificatory. The former or descriptive system exists in the great Aryan and Semitic families of nations and among the Turks. It is therefore found in all the modern civilized states of Europe and America, and it prevailed among the Romans, Greeks, and Celts. The distinguishing feature of this system is that it regards each removal from the common ancestor, or from the *ego*, as a separate and different degree of relationship. In all the nations within its range there exist or existed specific names for the primary relationships, father, mother, brother, sister, son, daughter, and in nearly all there grew up other specific names descriptive of additional degrees. The ideal doubtless is that every degree, as far as recognized at all, should have a distinct and appropriate name. This ideal, however, has never been realized. Collateral and remote direct consanguinity are generally designated by an augmentation (in our language by grand, great, etc.) or combination of the comparatively few specific names. In the Erse language, where the nomenclature is the least developed, there being no specific appellations, uncle, aunt, nephew, etc., are described brother of my father, brother of my mother, son of my brother, and the like. As an inevitable result in the system, the collateral lines following the actual flow of the blood are continually diverging, and are finally lost. We cannot enter into the details of kinship which would illustrate this description; the reader can, from his own knowledge, supply them sufficiently for purposes of comparison.

The classificatory system is based upon conceptions radically unlike those which lie at the foundation of the descriptive. It does not treat each removal from the common ancestor, or from the *ego*, as a separate and distinct degree of relationship. It treats all consanguinei as divided into a few classes, and all the individuals in the same class as in one and the same relationship, and the same special name is given to each and all alike. This is not a theory, but all persons in a class are regarded and addressed and speak as though they were absolutely in the same kinship to the given person. Thus, in some nations a person's actual father and all that father's brothers are in the same class, and are, in respect to the person, regarded as and designated by the name of fathers; while his actual father's son, and that father's brothers' sons, are in one class, and are his brothers. The number of these classes is small, always comprising the nearest relationships according to our own theory, and, in some nations, those of uncle, aunt, nephew, niece, and cousin in addition. As will appear in the sequel, the inevitable consequence of this method is, that all collateral lines, instead of constantly diverging, are soon brought together, and merge in the lineal line—merging thus, in fact, with grandsons and grand-daughters. This remarkable system prevails among the American Indians and among the great Turanian and Malayan families. We can merely give a very general outline of the relationships which are found in each.

In order to understand these relationships in their origin and cause, it is necessary to explain the tribal organization which is found among the American Indians, and, as Mr. Morgan shows, among many of the Asiatic peoples, and which was perhaps a primitive institution, common to all mankind in one stage of progress from savagery through barbarism to civilization. The Indians are separated into many nations—a nation meaning those who speak the same dialect and are united by the same governmental bond. Each nation contains "tribes." A tribe is made up of consanguinei, doubtless, as a matter of fact, descended from some common ancestor. A portion only of such descendants, however, make up a tribe. The distinguishing peculiarities of the organization are, that intermarriage between members of the same tribe is prohibited, and the tribe is perpetuated solely by descendants through the female lines. Thus a female must marry a male of another tribe, but her children by him are members of her own tribe; and when her daughters in like manner marry, their children also follow the same tribal status. A male must marry a female of another tribe, but his children pass out of his tribe and enter that of their mother. By this process the tribes are not localized, but are intermingled throughout the nation; and every family necessarily contains representatives from two tribes. If the tribal organization and membership were thus kept up in the male instead of the female line, the analogy between it and the agnatic family among the primitive Romans would be very remarkable. According to that system, collateral relationship, for all family purposes, did not extend, as with us, among all the consanguinei of an equal degree. On the contrary, starting from some common male ancestor, the male descendants in the male line from him, who would have been under his power if he had lived, alone constituted the kindred, or agnates as they were technically called. Every daughter, as she had married, had been cut off from the family which produced her, and she and her children belonged to the family of her husband. The agnatic family continued to affect the Roman law until the last traces of it were abolished by Justinian.

The following are the principal features of the classificatory system and the most important rules as to relationships which generally prevail among the American Indians. For purposes of clearness, the kinship given is that with *ego* as the interlocutor. All descendants from an original pair must fall into some of the designated classes, to each of which is given a special name; and, therefore, persons standing to the *ego* in different degrees, according to our rules, are often put into the same class, and are spoken of and plainly conceived of as though in the same degree. Cousin is the most remote degree or class admitted. Children of actual brothers are brothers and sisters to each other; the same is true as to the children of actual sisters; but the children of a brother are more remotely related to those of a sister. The relationship of uncle is limited to brothers of the actual mother and of those other females who stand to *ego* in the position of mother. The relationship of aunt is limited to sisters of the actual father, and of other males who stand to *ego* in the position of father. That of nephew or niece is limited, when the *ego* is male, to the children of his actual sisters and of the other females who are classed as his sisters, and, when the *ego* is female, to the children of her brothers and of the other males who are classed as her brothers. All ancestors above grandparents, and the brothers and sisters of grandparents and of such higher ancestors, fall into the single class of grandfather and grandmother; and the same is true of descendants below grandchildren. The children of my actual brothers, and of all the persons classed as my brothers, *ego* being a male, are my sons and daughters, and their children are my grandsons and grand-daughters; but the children of my actual and collateral sisters, *ego* being a male, are my nephews and nieces. If the *ego* is a female, the two sets of relationship last stated

are exactly reversed, children of a brother being nephews and nieces, and of a sister being sons and daughters. As we descend in the collateral as well as in the lineal lines, all descendants of an even degree with grandchildren are placed in the single class of grandchildren, and thus the two lines are merged. All the brothers of my actual father, and of persons classed as such, are my fathers, while all the sisters of my actual or collateral mothers are my mothers; but the brothers of my mother are uncles, and the sisters of my father are aunts. These are the principal features, which are to be found, with some incidental modifications and exceptions, among all the American Indians, and the Seneca nation of the Iroquois may be taken as the type. The chief peculiarities to be noticed are (1) the grouping of relationships, whether lineal or collateral, of different degrees of consanguinity, according to the actual flow of the blood, into the same class, so that the *ego* has several fathers and mothers, several sets of sons and daughters besides those whom he procreated, and several sets of brothers and sisters besides those born with himself from the same parents; and (2) that this arrangement does not exist in all cases, but is broken in upon when we pass from the male to the female line, or from the female to the male. The probable explanation of this last peculiarity is undoubtedly to be found in the tribal organization already described, and in the curious rule as to intermarriage connected with it.

LONGFELLOW'S AFTERMATH.*

WITH a part of this volume the public, or at least that part of it which reads the *Atlantic Monthly*, is already acquainted; but we believe the larger part now appears for the first time. Very pleasant it is to read, for so a book of Mr. Longfellow's must be. As was written of him years ago:

> "We need not praise the sweetness of his song,
> Where limpid verse to limpid verse succeeds,
> Smooth as our Charles, when, fearing lest he wrong
> The new moon's mirrored skiff, he glides along
> Full without noise and whispers in his reeds."

The limpid verse and the easy flow as of a river between cultivated banks are the same now as formerly; and the quality of the poetry is not different from the quality of that which thirty and forty years ago was giving pleasure. Thus to many this 'Aftermath' will have a double charm—its own absolute and intrinsic charm, and another that will be reflected on it by a light from other years. So it must be with all poetry—except, we suppose, the best, which makes its own time—and this it would hardly be worth while to say, were it not that the book, by its title and the prevailing tone of its sentiment, seem to ask that this be borne in mind. We may indeed go further, and say that the art of the accomplished poet appears to have been exercised more specifically to secure this result, and over the grace now present with us to throw the melancholy grace of remembered pleasure:

> "I have a vague remembrance
> Of a story that is told
> In some ancient Spanish legend
> Or chronicle of old.
>
> "It was when brave King Sanchez
> Was before Zamora slain,
> And his great besieging army
> Lay encamped upon the plain.
>
> "Don Diego de Ordoñez
> Sallied forth in front of all,
> And shouted loud his challenge
> To the warders on the wall.
>
> "All the people of Zamora,
> Both the born and the unborn,
> As traitors did he challenge
> With taunting words of scorn.
>
> "The living in their houses,
> And in the graves the dead!
> And the waters of their rivers,
> And their wine and oil and bread!
>
> "There is a greater army,
> That besets us round with strife,
> A starving, numberless army,
> At all the gates of life.
>
> "The poverty-stricken millions
> Who challenge our wine and bread,
> And impeach us all as traitors,
> Both the living and the dead.
>
> . . . . . .
>
> "For within there is light and plenty,
> And odors fill the air,
> But without there is cold and darkness
> And hunger and despair.
>
> "And there in the camp of famine,
> In wind and cold and rain,
> Christ, the great Lord of the army,
> Lies dead upon the plain."

To read this is inevitably to revert in thought to the time when we first read how

> "Once the Emperor Charles of Spain,
> With his swarthy grave commanders,
> Long besieged in wind and rain—
> We forget in what campaign—
> Some old frontier town of Flanders";

and to recollect, also, how once we read—

> ". . . . In some old marvellous tale,
> Some legend strange and vague,
> How a midnight guard of spectres pale
> Beleaguered the walls of Prague.
>
> "Beside the Moldau's rushing stream,
> With the wan moon overhead,
> There stood as in an awful dream,
> The army of the dead.
>
> . . . . . .
>
> "I have read in the marvellous heart of man,
> That strange and mystic scroll,
> That an army of phantoms vast and wan
> Beleaguer the human soul.
>
> . . . . . .
>
> "Upon its midnight battle-ground
> The spectral camp is seen,
> And with a sorrowful, deep sound
> Flows the river of life between."

And all is similar; not the surface alone, but there is in each poem, both the old and the new, the book-haunted imagination, the pensiveness of the sentiment, the moral lesson, the apparent gentleness and goodness of heart.

With this volume closes, it would seem, the series of "Tales of a Wayside Inn" which has helped to fill two or three of Mr. Longfellow's recent volumes. Here the Spanish Jew relates the story of Solomon and the Indian king, to whom, while the two are walking in the garden, the angel of death approaches. We cannot say that it is told very effectively by the Spanish Jew; but he contrives to justify himself for telling once more the already well-told story. He does so by one touch descriptive of the vanishing of the Indian king. The king has espied Azrael, and, in terror, has begged Solomon that he may be instantly transported to Ind. Solomon, complying, whispers a word into the clear heavens, raises on high the signet-ring in which the chrysophrase seems to flash with fire, and straightway

> ". . . Rushing from the west
> There came a mighty wind, and seized the guest
> And lifted him from earth, and on they passed,
> His shining garments streaming in the blast;
> A silken banner o'er the walls upreared,
> A purple cloud that gleamed and disappeared."

This story, by the way, is the one of this collection which has been chosen by Mr. Longfellow's artist for illustration, and the character of the design deserves a word of mention. It is very young-missish, and would deform any book; but in a book where the reader instinctively demands artistic intelligence and finish throughout, it is an especial deformity.

Next after the Spanish Jew's tale comes the Poet's tale of Charlemagne; and then follow on the story of Eginhard and Charlemagne's daughter Emma, and how she carried her lover through the snow; a pretty story of the Quakeress Elizabeth Haddon, who one morning said to Friend John Estaugh:

> "I will no longer conceal what is laid upon me to tell thee,
> I have received from the Lord a charge to love thee, John Estaugh,"

and who afterwards became his wife; the story of the monk who, like the fakir before him, stole the countryman's ass, and persuaded the countryman that the ass had been an ass but by magic or miracle; the story of George Castriot's treason to Amurath; a wild Scandinavian ballad story; and in conclusion the "Rhyme of Sir Christopher," printed in the *Atlantic* the other day, and appropriately put into the mouth of the landlord, who offers it with great diffidence of his abilities as a story-teller.

There is nobody who will not be sorry that the series has come to an end, and the reader closes the book wondering why it should—so strong is his impression, produced by the easy grace of the poet, that the narrator might go on for ever, or like Schehezerade, and make or versify one of these stories every evening or two. The poet probably thinks differently, and fancies that the reader would very soon be pointing out the stories on which no more than an evening or two had been spent, and asking that the new stories, and perhaps the old also, should be weeded a little.

Following the tales are a dozen fugitive pieces, some original, and some translated from the Spanish. Of one of them we have quoted some stanzas.

Six Months under the Red Cross with the French Army. By George Halstead Boyland, M.D., Ex-Chirurgien de l'Armée Française. (Cincinnati: Robert Clarke & Co.)—The approaching trial of Marshal Bazaine gives a certain timeliness to this narrative, the scene of which is for the most part

* 'Aftermath. By Henry Wadsworth Longfellow.' Boston: J. R. Osgood & Co.

laid in Metz. The author does not discuss the question of Bazaine's loyalty, but he evidently sympathizes with those who denounce the surrender as an infamy unparalleled in the history of European warfare. At the same time, he records his surprise, on first seeing the walls of Metz, that they were so void of cannon to resist a siege; says of the outlying forts, that they were in a state of incompletion almost incredible; and, generally, that the want of preparation was such that "the French certainly deserve great credit for holding out as long as they did." In fact, the impression made on the reader is that, had the Germans been indifferent to the cost of an assault, they would have had little difficulty in taking the city in that way. After the engagement at Borny (August 14) ("this field was the only one the Army of the Rhine occupied after battle"), the gates of Metz were opened to a column arriving in the early morning by a sleepy guard, "bearing a candle in his hand, and rubbing his eyes. I saw no sentinels anywhere about. The city was in a state of siege, and the enemy not three miles distant." Again, on the eve of the battle of Rezonville, "the French had no pickets anywhere, and the Prussian scouts were loitering all along our roads as if they belonged there. I noticed one in a cabaret only half a mile from Metz." More singular, after the investment had been completed, the city journals were not put under restrictions. "The news-vendors brought us these papers every day, and were allowed to go, not only all through our lines, but also into the Prussian lines, so that the enemy knew exactly what was going on. In these papers was printed from day to day a detailed account of the French forces, with the names of the generals commanding them, and the position they occupied. Moreover, an account of the remaining stores was given, and one editor advanced an opinion as to how long the siege would last." Of a piece with this was the firing of a cannon whenever the balloon-post was sent off, thus warning the Germans to be on the lookout to bring it down if possible—as they generally did.

Concerning the fighting qualities of the French soldiers, Major Boyland has little that is new to tell us. He saw them at their best at Borny. His general judgment of them is contained in the following extract:

"I have known a whole squad of them to fire at one man—and miss him. Their character is so excitable that they are easily overcome by a cool hand. Prussian officers have told me that, when going into battle, their men would be wounded or killed before they could get within a sufficient range to reach the French; but on coming, a large percentage of the balls went over their heads. This is attributed to the fact that the French in their flurry would forget to set the little *cran* on the barrel of the chassepôt, marking the distance, right, and when they came nearer the enemy (supposing the *cran* to have been regulated 1,500 yards, and them now within 800 yards), the balls would go much too high, while the Prussians had only to pour in a fire underneath."

What follows is not new either, but will bear repeating. At Martigny,

"The best house seems to be the café, before which officers and soldiers are sitting together. This is one of the secrets of their indiscipline. . . . The French soldiers, familiarized by their officers, become disrespectful and careless—a laxity of discipline being the natural consequence. I have never yet seen Prussian soldiers and officers sitting together in any public place. The officers hold themselves aloof from their men, whom they treat with the utmost severity; the men in their turn are taught, almost from their birth, to respect their officers. I have seen them sitting at a café in Berlin, and an officer came in. They got up, saluted, and remained standing till he passed them; they then immediately paid for what they had, and left the café. Whenever they meet an officer anywhere, they salute. The French rarely salute any but the officers of their own regiment."

One of the oddest phases of the siege was the independent organization of the National Guard, three thousand in number. They afforded much amusement to the regular troops by their awkward drill, and by their ignorance of the trumpet-calls, playing the reveille at night and the *diane* at midday, "while they march to the music generally played to summon the soldiers to the distribution of rations at four o'clock every afternoon." These doughty warriors assumed charge of the public buildings. When news came of the fall of the Empire, they needed no conversion to the Republic. The first thing they did was to make a night demonstration at the city hall, where the old mayor came out and read for them a manifesto to this effect: "The National Guard wishes to assure Marshal Bazaine that he can count upon them. The municipal council will not in any way be answerable for events that have not been entrusted to their responsibility. The inhabitants must undergo privations equal to the occasion." This having produced no effect on anybody, they next demanded that the eagle surmounting the French flag should be torn off, and made the tour of the public buildings until they had accomplished the removal of the odious symbol. Finally, they tried to exact of Bazaine an act of cohesion to the Government of National Defence, and a promise of no surrender; but without avail.

We need not dwell on the evidence furnished by Major Boyland of the inefficiency and disorganization which characterized the medical as they did all other branches of the French service. It may, however, be of interest to note that the *infirmiers* received as wages 75 francs a month, while the pay of the common soldier was but 15 francs; so that whenever vacancies occurred among the former (some of whom, it was found, "had enlisted to rob the dead upon the field of battle, to say nothing of the living with whom they were in daily contact"), they could readily be filled by volunteers from the ranks. Contrary to our American experience and the latest views on hospital construction, our author observed that "the wounded that were kept in tents during the siege of Metz seemed to die more rapidly than those in the buildings; they did not linger so long, and the average rate of deaths was greater." In a tobacco factory assigned for use as a hospital, and in which "piles of tobacco-leaf lined the walls, leaving a great wide space between them," in which the wounded were placed (on stretchers in default of beds), Major Boyland noticed "that these wounded at first seemed to do better than the others; but soon they began to fall off. . . . Doubtless the tobacco, with which the room and whole building were impregnated, acted as a narcotic, and thus aided in producing pyæmia."

Major Boyland engaged for the war as assistant surgeon-major in the First French Ambulance. His diary, as here given, has all the marks of truthfulness and candor, and has a positive value as a contribution to the history of the Franco-Prussian conflict. It would have had more if it had been less arbitrarily divided into chapters, and if accompanied by a sketch-map of Metz, its gates, forts, roads, and principal suburbs. We should have supposed that the author would have preferred to conceal the fact of his participation in occasional sprees, such as that one in which the barmaid's father, interposing to protect her from an excess of attention, is rudely pitched out of the window, with a broken arm; still more the fact that, when his mission was to save human life and suffering, and he wore the protecting badge of the non-combatant, he "had the satisfaction," on one occasion, of "bringing down" a German picket from behind a bush.

The Pilgrimage of the Tiber, from its Mouth to its Source; with some Account of its Tributaries. By Wm. Davies. (London: Sampson Low; New York: Scribner.)—It is remarked in the preface to 'The Pilgrimage of the Tiber' that "it is somewhat singular, in these days of much travelling, that the course of the Tiber, the most classic of all streams, should either never have been completely explored, or else no account should have been given of it in its entirety, either in the English or Italian language, as far as I am aware." If the author means by this anything more than that it is singular that no one had been before him in perceiving how taking a title for a book would be the one which he has chosen, we beg to differ from him. The guide-books and many books of travel have given all there is to be said of interest on all parts of the Tiber that have interest, and the fact that Mr. Davies has been obliged to make up the substance of his book from historical records connected with Tiberine localities, shows that, even for a professed pilgrim by its shores, there was little to be said about the river or the country that lies along its course except what is connected with Rome and, after a long interval, Perugia. 'Traditions of the Tiber' would have been the proper title. Rome is the Tiber's better part, and this the author practically acknowledges by filling nearly half the book with a hash of the guide-book literature of Rome—162 pages out of 340 being devoted to the city and its immediate vicinity, with the exception of the few opening pages relating to Ostia and the mouth of the river.

The original matter of the book—*i. e.*, the story of the journey up the stream—is a poor piece of 'prentice-work. Its comments and description are commonplace and often bombastic, its erudition mere undigested cramming, and its history a promiscuous medley of fable, romance, and fact. It is impossible not to perceive that every pains has been taken to make up a volume of reasonable size, and much rubbish has been foisted on the printer in this determination. It is a good sample of the result of trying to think up a subject. Apropos of Ostia, we have the mythology and theology of Jupiter, Cybele, and Mithras; in allusion to the Protestant cemetery, we have a detailed account of the funeral rites of Shelley; and all through the book we are on all possible occasions reminded that thereby hangs a tale, and then we have it. This need not have prevented the book from being a good and artistic one; but it is neither. Evidence of original powers of observation or reflection we cannot find in it. With such a trite and sophomorical opening as this the author greets the Eternal City: "What a strange sensation is that which overpowers the traveller on his first arrival in Rome! With what varied and innumerable associations is his mind filled! The very name of it is laden with memories which breathe a vitality through the banished centuries, ensouling the present with the mighty energies and active life of the past." The historical excerpts are of all sorts, as we have already indicated, and are brought together without the least regard to authenticity or the result of modern research. But we must render the book the justice to say that some of the mediæval stories are new to the general reader and

interesting; peculiarly so is a long account of Cellini's escape from St. Angelo. The chapters "From Scorano to Todi," "Perugia, Assisi, and the River Clitumnus," have an average of the attractiveness imparted by commonplace travellers to places whose chief interest is foreignness. The chapter on popular songs is a selection from the collection of Tigri and Visconti, with a single exception. The translations, which are our author's, do not recommend themselves as such for fidelity either to metre, sense, or style.

"Vola, palomba, quanto puoi volare;
Salisci in alto quanto puoi salire;
Gira lo mondo quanto puoi girare;
Un giorno alle mie mani hai da venire,"

is not rendered by

"Fly, fly, wild dove, as far as thou canst go;
Rise in the air as high as high may be;
Sweep round the world wherever winds may blow;
One day, where'er thou go, thou must return to me."

Nor is it tolerable translation to turn

"Un garofano ho visto da una banda
Dall' altra parte un generoso fiore"

by

"A pink opens out on one hand,
On the other an exquisite flower."

Nor is any conception of a metre like

"La prima volta che m'innamorai"

given by a versification like this:

"When first the sweet pleasure of loving I knew";

nor is any idea of the classical simplicity of diction in any of the songs given by the author's renderings. The repetition, in the first quotation, of "quanto puoi" in each line is exchanged for a forced and trivial diversity of phrase antagonistic to the very spirit of the Italian song.

The Geological Evidences of the Antiquity of Man, etc. By Sir Charles Lyell, Bart., M.A., F.R.S. (Fourth edition. London: John Murray; Philadelphia: J. B. Lippincott & Co. 1873.)—The original work of Lyell on the antiquity of man was a timely and able contribution to knowledge. It was not so much the fruit of original research as a compilation of the researches of others in ethnology and archæology, with an exposition of the geological relations of the fossil remains of man found in caves and the remains of ancient human workmanship found in other repositories in connection with the bones of extinct animals. The original investigations of Boucher de Perthes, Morlot, Troyon, Steenstrup, Lartet, Fuhlrott, Christy, Prestwich, Evans, and many others, with the critical observations of Huxley and others, had brought together such a body of evidence, and had indicated so forcibly its bearings upon the antiquity of man, that such a work was needed to embody and discuss this evidence. In the treatise in question, that work has been performed with thoroughness and candor. Its publication has been followed by a very general acquiescence among scholars in the main proposition, namely, that the existence of man upon the earth cannot be measured by the six thousand years of the old chronology, but stretches back into the past for tens of thousands and, not unlikely, for hundreds of thousands of years. The acceptance of this conclusion, and the consequent enlargement of the recognized period of human existence, must be regarded as one of the greatest events in science within the present century.

The present edition is a revision of the last, with additional matter. It is now in three distinct parts, of which the first treats the evidences of the antiquity of man from remains of ancient art, and from osteological remains of man found in connection with those of extinct animals; the second treats of the glacial period, and, incidentally, the question whether man was preglacial or post-glacial in the time of his first appearance; and the third treats the origin of species with reference to man's place in nature.

We are glad to see this revised and enlarged edition, which will be hailed with pleasure by all who are interested in the progress of knowledge. An objection might be taken to the patronizing air with which the several subjects are handled, more especially as the work is chiefly a compilation from the researches of other men; but so much of unquestionable value in geological science has been achieved by this eminent scholar that we are easily reconciled to his assumption of the mental attitude which is involved in the parental relation. We are chiefly indebted, however, to Prof. Huxley, perhaps the greatest living expounder of science, for the solid ground on which our knowledge of the antiquity of man now reposes:

Fine Arts.

SALVINI'S OTHELLO.

IT is magnificent, but it is not *Othello*. An *Othello* it is, and great of its kind, but not Shakespeare's. No wonder, though, that it receives the applause of listening nations; for in it the idea of *Othello* is reduced to the comprehension of the meanest capacity, and made easy for the apprehension of the dullest; and this idea is illustrated by an actor whose voice, whose person, whose flexibility of face, whose action, whose dramatic intensity, whose clearness of conception and directness of purpose, and whose physical force are each of them so singularly admirable as to be a distinction in itself, and unite in a combination of almost incomparable splendor.

Italians are born actors; far more so than Frenchmen, who are rather born talkers. The acting, the characteristic acting of the Frenchman in real life and upon the stage, is the action of restraint, of concealment, of suggestion, of *finesse;* that of the Italian is the action of revelation. He acts, consciously or unconsciously, to show all that he feels, all that he thinks; to make you see with his eyes, think with his brain, and feel with his soul. But expressing thus his profoundest emotions with vivacity and strength, he lacks, except in moments of calmness, the power and the dignity which are given by reserve; so that, for instance, his manifestations of anger are generally more laughable than terrible. In Signor Salvini the histrionic genius of his race seems to have reached its most characteristic, as well as its highest, development. If he were dumb, he might play *Othello* just as he plays it now, without speech, and with little loss of dramatic, or rather of histrionic, effect (although with the great loss of his beautiful elocution), so expressive is his face, so unmistakably clear is the meaning and purpose of his every movement, every gesture. Salvini is an actor of study, but above all an actor from impulse. His performance shows deliberate design, large and clearly conceived plan, and the minutest elaboration of detail; and then, notwithstanding all this, action according to the emotion that he summons up, rather than according to even his own intellectual perceptions and convictions. Rarely has the stage seen an actor who so perfectly as he illustrates that marvellous passage in "Hamlet":

"—— this player here
Could force his soul so to his own conceit
That from her working all his visage wan'd:
Tears in his eyes, distraction in's aspect,
A broken voice, and his whole function suiting
With forms to his conceit."

Salvini's subjection to the emotion into which he forces his soul, rather than his conformity to his own convictions, is very manifest; and, what is rarely the case with an artist, we are able to make a distinct comparison between the two. In a letter addressed by him to the *Roman Times*, and published on the 23d of last February, he says of *Othello:* "It is not his jealousy, it is not hate, it is not a ferocious impulse—it is the indignation of the honest man which impels the Moor to sacrifice his love, his adoration, his worship of Desdemona." A not uncommon notion of *Othello*, but a very incorrect one. *Othello is* jealous, grandly jealous if you please, but terribly so; and he does sacrifice his love, his adoration, and his worship of Desdemona; but it is to that form of selfish personal pride which is called jealousy by all the Indo-European peoples—a passion not noble; indeed very mean and selfish; which sometimes has its spring in sexual love, but sometimes exists even between the sexes—particularly on the part of women—without love; and which also arises in connection with all other emotions and desires, and in all has its rise simply in wounded vanity and disappointed desire—a passion which had its birth, according to the grand myth of Genesis, almost with the world, and caused the first murder, the first fratricide, and which, according to Milton, was known to celestial natures, and caused the first rebellion before the world began. Be this as it may, no performance of *Othello* could well be more unlike Salvini's description of *Othello* than Salvini's own performance. For if ever man was jealous with blind, self-tormenting, furious, raging, and only-with-blood-to-be-satiated jealousy, if ever man acted from ferocious impulse—with the impulse of a madman and

the ferocity of a wild beast, it is the Moor into which Salvini turns himself. It seems as if it were only the deadliness of his fixed purpose that keeps him from becoming a raving maniac before he has glutted himself with revenge, and sacrificed his love and the object of his love upon the altar of his wounded pride. This is jealousy; and Shakespeare's *Othello* was indeed jealous; but not exactly in this way.

The whole tragedy is changed, too, for the sake of the actor who represents its principal personage. In Salvini's "Othello"—we mean the play—the action is as much simplified as, in his conception and action, the chief personage is. This is a great loss; for all Shakespeare's men and women are creatures of complex natures. *Othello* is perhaps the simplest of them all; but being a man, and not a beast, he too is complex. Simplicity of design and structure is a good thing in its way, but it is not always the most admirable. There are animals whose structure is very simple, consisting chiefly of a mouth and a stomach, with some imperfect means of locomotion—they are very easily understood and described; but for that very reason they are not quite so interesting as other creatures of more complex organization—men, for instance, and also women. Now, Signor Salvini's *Othello* is a very simple creature. His nature consists of courage, furious passion, both in the largest and grandest style, and with these a kind of animal dignity, under ordinary circumstances, somewhat like that of a huge mastiff or of a Bengal tiger in repose. This is all. These traits are represented with a native power, the contemplation of which is in itself a great delight, and with a mastery of histrionic art which is unsurpassed by that of any artist of this generation, which indeed is, to our conception, almost unsurpassable. But, nevertheless, the outcome of all this, admirable as it is, is unsatisfactory. Salvini's *Othello* is not only too simple, but it is lacking in one great element—it is not heroic. Grand, and strong, and brave it is; but it is not elevated.

So with the version of the tragedy which he presents. It is shorn of all that lifts it (except as to the words in the mouths of the three principal characters) above the rank of a great melodrama. The many circumstances and the complicated motives that weave themselves like a fatal net about the wretched Moor and his hapless love are all swept away as surplusage, and we have the bare leading facts that *Othello* loved *Desdemona*, and she him; that they were secretly married against her father's will; that *Iago* pumped jealousy out of infinite space into his breast; and that he killed her and then cut his own throat. For—to give an instance, and we can do no more—in this version of the tragedy *Cassio* and all his surroundings and actions are almost obliterated. *Cassio*, the man whom *Othello* loved, he who had a daily beauty in his life which even *Iago* saw and felt, and confessed that it made him ugly; he who, although a man of gallantry, had a soul so firm and lofty that he could resist and rebuke the temptations of *Iago* in regard to *Desdemona;* who was a soldier fit to stand by Cæsar and give direction; whom the Venetian Senate thought fit to take *Othello's* place when *Othello* was in highest favor; one of the loveliest characters that Shakespeare ever drew—*Cassio*, the jewelled pivot upon whom the action of the whole play turns, is almost cut out of the play, and is degraded into little more than a drunken sergeant. This is very sad business. It is destruction of Shakespeare's conception. We could have better spared a worse man—*Iago*, if it were not absolutely necessary that *Iago* should torment *Othello* and, still more important to some of us, be stabbed by him. And we could have all the better spared him because of the way in which this *Iago* was "presented or disfigured." All *Iagos* are bad. We have never seen an *Iago* that had the remotest idea of his own nature, or of the reason for his existence. But all the badness of all the *Iagos* who have ever made it seem impossible that any one of them should deceive an adolescent gander is concentrated in the *Iago* whom Salvini suffers *Othello* to lure to his destruction.

In all the detail of the action, as in the manifestation of great passion, Salvini is simply perfect. Emotion flashes over his dark face like heat-lightning across a cloud. His fingers speak, and his very step betrays his feeling. Under the probe of his tormentor his audience-chamber becomes a cage to him, and he strides stealthily back and forth along the wall as if he longed to spring but could not. He devours *Desdemona* with his eyes; and sometimes mumbles and mammers over her in a somewhat repulsive fashion, which yet is quite consistent with his conception of a Moor and of a Moor's love. When, in the fourth act, the messengers come from Venice, and *Desdemona* enters with them, he behaves to her not like a man of noble nature wounded and outraged, but with the caprice and the rage of a wild beast. Quite possible, all this, in an untamed savage. But Shakespeare's *Othello* was not untamed nor yet a savage.

One strange mistake Salvini makes in costume. We can pass over his playing the third and fourth acts in a blue jacket and trousers, making him with his woolly head, look like a big black boy; we can even forgive his standing through these two acts in one tint of light blue by *Desdemona* in another tint of light blue, which is worse than the Princess Pauline Bonaparte's "getting herself up in a blue dress to sit down in a green chair." These are the trifling miseries to which the eye is subjected by those who are regardless of the harmony of forms and colors; but when an error in costume really affects the action and the sentiment of a scene, it is time to protest. In the second act, when *Othello* arrives at Cyprus, Salvini appears in a coat of chain-armor, with plate-armor over it; back and breast pieces, greaves and plated gauntlets and a helmet. He retires with *Desdemona* to their bed-chamber. The long scenes between *Iago* and *Roderigo*, and *Iago* and *Cassio*, follow, then the drunken scene followed by the brawl; and when the alarm is given, down comes *Othello* still armed cap-a-pie just as he went up, chain-armor, plate-armor, helmet, gauntlets, and all; and thus panoplied he rushes between the combatants. What were their little rapiers to him! In such an iron shell Corporal Nym himself might have thrown up their swords with his hands. They might as well have tilted at the Tower of Babel. And it was midnight. We have heard of men going to bed under certain circumstances with their boots on; did *Othello* mean to sleep on that particular night in full harness? Now when *Othello*, according to the tradition of the English stage, which we may be sure comes straight down from Shakespeare, rushes on in gown and slippers, with his sheathed sword hastily caught up in his hand, and thus breaks in between the brawlers, it all means something; and that meaning is entirely lost in Salvini's representation.

So in the fifth act great violence is done to Shakespeare's conception by what is called in stage cant the "business" of the last scene, which is exactly what the author of the tragedy intended that it should not be. The original stage direction has come down to us; it is, "*Enter Othello, and Desdemona in her bed*"; and it is plain that in Shakespeare's imagination of the scene she did not leave her bed. There can be no mistake about this, for after *Othello* has talked with her for some time, and just before he seizes the pillow to smother her, he says:

> "Sweet soul, take heed, take heed of perjury,
> Thou 'rt on thy death-bed."

And it is while she lies thus, and he bends over her, that her loveliness comes like a gleam of dawning joy between him and his dark purpose, from which all impulses of soul and sense unite to turn him. Salvini, bloodier than *Othello*, mangles all this tender beauty. He causes *Desdemona*, when she wakes, to rise and come to the front, where she remains chiefly with her back to the audience, while he glares, and grins, and sputters at her like a maniac, until at last he seizes her in his arms, and half carries, half drags her, shrieking, struggling—shall we say kicking?—the whole length of the stage; and there behind those curtains we know he does not smother her with her pillow, but strangles her with his brawny hands. And his own death is after the same brutal fashion, and with the same violence to Shakespeare's lofty and tender conception. Shakespeare's *Othello* dies because in his sense "'tis happiness to die"; and, turning to *Desdemona*, after he has given himself the death-stroke, he dies "upon a kiss." And as to the manner of his death, that is made as plain as possible:

> "I *took by the throat* the circumcised dog,
> And *smote* him, thus."

Could a picture be more vivid of a man seizing his enemy's throat by his left hand, and with his right thrusting his weapon into his heart? And, plainly, there should be no hint given, no suspicion awakened, of *Othello's* intention until "thus" comes with the thrust of the dagger, which does its work instantaneously and unobtrusively. But Salvini clutching at his own throat, and drawing a curved knife after his speech, saws away at it like a pork-butcher killing a swine. And then, with no thought of *Desdemona*, he tumbles struggling upon the floor, and the curtain, which in Shakespeare's "Othello" falls upon the tenderness and the grandeur of his heroic woe, comes down swiftly (but not swiftly enough) to hide his muscular quivering and his fleshly agony. Strong-stomached men can just bear this, although it requires the robust sentimental appetite of woman to relish it; but who that knows Shakespeare's "Othello" can suffer without an outcrying protest such robbery of all that elevates it above a mere desperate murder and suicide?

And yet this tragedy, thus mutilated, voided of its great purpose, and stripped of all its charm—this "Othello," thus misrepresented if not misconceived—takes us up, will we nill we, carries us along in a tempest of emotion, and leaves us at the close shattered to the very centre. For the reality, the personal magnetism, and the overbearing individuality of Salvini's acting are irresistible and terrible. We protest, and yet we look and listen. We sicken at this grand brutality, and yet we gaze upon it fascinated if not delighted; and we leave the theatre feeling that there has been a revelation to us—not of a new heaven but of a new earth.

NOW READY,

ELEMENTS OF PHYSICAL MANIPULATION. By Edward C. Pickering, Thayer Professor of Physics in the Massachusetts Institute of Technology. In one volume octavo, illustrated. Price in cloth, $3.

This work is designed to meet the want so strongly felt of some means of teaching Natural Philosophy practically. It supposes the instruments themselves in the hands of the reader, and shows him precisely how to use them, what precautions to take and what errors to avoid.

It is intended as a hand-book for teachers, for the large class of amateurs who devote their leisure to some branch of physical enquiry, and more particularly as a text-book for the physical laboratories now introduced so generally in all our larger colleges and scientific schools; the apparatus described is such that it can be made at very small expense.

The great object of the book is to foster experimental research, and it therefore contains much of the practical knowledge needed for such work. As this is beyond the scope of the ordinary text-books, every physicist has heretofore been obliged to acquire it by long and often laborious personal experience.

The position of the author, in charge of one of the first and largest physical laboratories in the country, has given him an opportunity he could not elsewhere have obtained to test most of the experiments with large numbers of students. The work is, in fact, based on the manuscript directions thus employed, thereby eliminating many of the errors which in a work of its character would otherwise be so difficult to avoid.

Correspondence with teachers is solicited by the Publishers,

HURD & HOUGHTON,
13 Astor Place, New York;
THE RIVERSIDE PRESS, Cambridge.

BOOKS BY MAIL.

Orders for books are subject to the following conditions, which must be strictly observed:

1. That the money be forwarded in advance whenever the price is known.

2. That enquiries as to price or other particulars be accompanied by a *stamped* and addressed envelope for the reply. (These enquiries should be as *specific* as the knowledge of the writer will permit. It is presumed that in most cases the name of the work, of the author, or of the publisher can be given.)

3. That both money and books shall pass through the mails at the risk of the purchaser.

THE WEEK IN TRADE AND FINANCE.

SEPTEMBER 22.

THE events of the past week in financial circles have been of exciting, if not positively startling, character. The failure of the Warehouse and Security Company, noticed in our last, was merely the prelude to a more general apprehension concerning the condition of banks, trust companies, and fiduciary institutions. It was known that the legal-tender reserve had been drawn down to a lower point than has been reached in many years. This arose from causes both natural and artificial. Large drafts had been made on New York for currency needed at the West and South. This drain of itself the banks could have easily withstood; but at the same time it happened that our customary help from England and the Continent failed. Hitherto it has been easy for almost any railroad corporation with decent credit to effect loans in Europe for specified periods. The agitation in certain Western States against railroads, the threats of hostile legislation, and predetermined decisions of the courts, have shaken the confidence of European capitalists so that they have curtailed their loans to America. This naturally threw a large burden on the New York banks just at the time when they were least able to bear it.

All this could probably have been got along with had it not been for the actual locking-up of greenbacks. It is impossible to resist the conviction that the bear speculators, with Jay Gould at their head, had actually withdrawn a large amount of money and locked it in their safes for the purpose of buying cheap stocks, after they should have created sufficient alarm and distrust as to frighten the timid capitalists, and thus crippled the efficiency of the banks. Accordingly, on Wednesday of last week the "hammering" process was begun, the stocks selected being the Rock Island, Toledo and Wabash, Western Union, all of them strongly held by the bulls. A general call for "margins" was the result. Next day the banks began to call in temporary loans, and, like a bolt from a summer sky, the announcement fell on the Street that the great house of Jay Cooke & Co. were unable to respond. The difficulties of this house were attributable to over-sanguine investments in the Northern Pacific Railroad, and its failure was received with uproarious excitement by the stock men. The blows of the bears had struck game much higher than they could have hoped for. The new railroad speculations at once became the rallying-cry of the alarmists. The depression extended to Lake Shore, New York Central, and the Vanderbilt stocks generally.

Next day, Friday, the banks, seeing the market values of first-class railroads shrinking so rapidly, as a measure of prudence called again and more loudly for repayment of their "call" loans. At such a time it was almost impossible to sell even the oldest and best-established stocks and bonds without great sacrifice. About eleven o'clock it was learned that the conservative banking-house of Fisk & Hatch was also unable to respond. This announcement was greeted as the precursor of a general crash; for it was believed that this was one of the richest and soundest business houses in New York. It would appear that they had advanced large sums to railroad corporations (all of them completed and solvent, but not fortified by any large bank balances), and that their suspension is more of the character of an accidental suspension than a downright failure from losses. From that moment Wall Street became greatly excited and the Stock Exchange half frantic. Values began to decline—so far as they are indicated by brokers' sales—and the bear speculators were in their glory. They had succeeded in selling down some of the leading stocks ten to forty per cent., and now began to buy in, to cover sales made at higher rates. The following will give an idea of the infatuation of those three days of Stock Exchange madness, comparing the highest and lowest prices of the week:

	Highest.	Lowest.
Harlem	128⅛	90
N. Y. Central	104	91
Erie	59	53
Toledo and Wabash	59	38⅛
Northwestern	58⅛	40⅛
Rock Island	107	88
Western Union	91	45

Of course numbers of brokers were soon involved, either by the failure of their principals to respond with sufficient "margin," or by the unwillingness of the banks to certify their checks. At this time rumors were circulated of "runs" on the banks and failures of several of them. Only one, however, the Commonwealth, had suspended. Eighteen names were read off in the Exchange as among those unable to stand by their contracts. Friday night closed upon a most excited community, and many appeals to the associated banks and to the Government to do something to quiet the alarm. On Saturday the scenes at the Exchange were renewed. The Clearing-House banks had done what they could—they had agreed to pool their currency in a common fund, and to issue loan certificates against their assets, which shall be exchangeable among themselves. Unfortunately, this was an evidence of their depletion gratifying to the bears. Prices were receding still lower; the difficulty of getting checks certified, however, and the distrust of the condition of the banks, made dealings hazardous to all but those who had provided a store of bank-bills for this occasion. The sellers of stock prayed for a cessation of dealings, and at noon on Saturday the Exchange was closed, and so remained at the date of our going to press.

This action was deemed eminently wise, and has demonstrated the fact that, as a source of mischief, the stock gamblers, when congregated, are unrivalled. It is not deemed prudent to reopen the Exchange until as many settlements have been made privately as can be, as the resumption of business is certain to be followed by numerous sales of delinquent members' stocks "under the rule."

Gold, which had fallen during the past week to 110⅞ @ 111, was moved upward to 113 for a short time, and gradually receded to 111⅞ @ 112, at which figure it stood when the Gold-room was closed on Staturday, and dealings were settled at that figure in the absence of other quotations. Foreign exchange on the prospect of remittances hither and of less importations has receded to 107¼ @ 107½—an indication that in certain articles our orders to Europe have been curtailed.

The gravity of the situation, or rather its apparent gravity, may be gathered from the fact that the President and the Secretary of the Treasury, accompanied by Reverdy Johnson, came to New York on Sunday morning, and during that day were in long and anxious consultation with Messrs. Vanderbilt, Schell, Clews, Chittenden, and other merchants and bankers.

NEW ENGLAND SECURITIES
SAFE AND PROFITABLE.

By the purchase of the First Mortgage Sinking Fund
GOLD BONDS
OF THE
VERMONT DIVISION OF THE PORTLAND AND OGDENSBURG R. R. TRUNK LINE,
A
TEN PER CENT. NEW ENGLAND INVESTMENT
may, at present rate of gold, be secured.

The very large sales of the past few months leave but a limited amount to be offered, and the rapid pushing of the road to completion ensures an early and a large advance on their market value.

The Nation.

NEW YORK, THURSDAY, OCTOBER 2, 1873.

The Week.

THE panic was ended on Tuesday by the quiet opening of the Stock Exchange. In financial affairs, the week has been one of great quiet in New York. The closing of the Stock Exchange put a stop to all speculation, and the banks confined themselves mainly to aiding the merchants proper. An attempt of the Stock Exchange to get them to supply increased facilities to the brokers failed, and for obvious reasons. The first $10,000,000 of Clearing-house certificates, which were made to do the work of greenbacks in the manner we described last week, was soon exhausted. Another $10,000,000 was then issued, and the supply was still short; and the banks then resolved on issuing as many as might be necessary during the crisis—news which caused a good deal of cheerfulness "on the Street" on Saturday. What this process amounts to as far as the outside public is concerned, is simply the addition to the circulation of an enormous amount of checks drawn by private individuals certified by the banks. For instance, a man wants money, and he takes securities to the bank, which takes them to the Clearing-house, and obtains in return a guarantee from the other banks that they will stand by it to the extent of 75 per cent. of the value of the securities. It then certifies that the owner has funds to a certain amount on deposit in its hands, and he goes off with the check, and uses it in his business as money. The device is novel and ingenious, but is doing good service, and has carried the banks through the panic and saved the business world from a great calamity. The addition made to the circulation by this means and by the Government purchases of bonds during the week, and the certificates of the banks, is estimated at about $50,000,000, and the increase will continue, so that we shall probably have in a week or two a great plethora of money, when the enormous sums now hoarded by "the conspirators," as one Washington correspondent calls them, shall have been returned to the banks. The business of the country has passed splendidly through a very trying ordeal.

The most noteworthy thing in the crisis is the all but total repudiation of the National Bank Law. The banks in all the large cities are required to retain a reserve of 25 per cent. of the aggregate amount of their notes in circulation and their deposits. They have not now and have not for the past week had anything like this amount, and are legally prohibited from making any new loans or discounts as long as this state of things lasts, except by the purchase or discount of sight bills of exchange. But they are making more loans and discounts than ever, and, so far from standing in any danger from interference on the part of the Comptroller, a letter of the President to Mr. Claflin of this city impliedly approves of what they are doing, and encourages them to do more of it. One other fact curiously illustrates what a loose and easy-fitting garment our financial legislation is. It has been the practice of certain banks to enable stock-brokers to carry on their operations by certifying their checks early in the day for enormous amounts, when there is not one cent to their credit, on *the understanding* that the broker will make his account good before three o'clock by paying in the money or depositing securities. In other words, the bank makes him great loans, to be used in highly hazardous operations, without any security whatever. That such a system should have been carried on so long and with so little loss and damage, is a striking proof of the integrity of the brokers; but when a panic comes, it brings the brokers' banks to the ground; and even in the best of times it supplies the makers of "corners" with their ammunition. In other words, it offends against sound banking and good morals. Its evils are just now the subject of general comment, and there is an almost unanimous expression that it ought to come to an end, and that the brokers ought to have a bank of their own to effect their own clearances and support their "little games." Now, it will hardly be believed by many of those who have been listening to the talk of the last week on this subject, but it is strictly true, that there is a special act of Congress—that of March 3, 1869—which prohibits national banks from certifying any checks, unless the drawer has on deposit at the time "an amount of money equal to the amount specified in the check," and subjects any bank which disregards the prohibition to the extreme penalty of being wound up by the Comptroller; so that this practice of bolstering up stock speculation might have been stopped by that officer long ago if he had done his duty. As the world has gone thus far, it is no discredit to any banking law that it should break down in panic. The old banking law of this State was deliberately set aside in 1857 by the judges, in private consultation, in advance of any suit or motion, and the English Bank Charter Act of 1844 is regularly broken whenever the drain of bullion cannot be stopped by raising the rate of interest. But any banking law ought to be enforced in ordinary times, and it would seem as if, as we have tried to show elsewhere, the great commercial countries had reached a pass at which legal provision for crises and panics was absolutely necessary. They occur so regularly that there is no excuse for any longer dealing with them by revolutionary processes, and banks ought to be empowered and required to meet them in a specified manner.

The Barings, unless men of very superior mould, must have taken grim satisfaction in the failure of the two bankers to which our Government recently committed the business which their own house had done for eighty years. The American community, however, cannot be expected to see anything very entertaining in the spectacle. It not only does not help the national credit, but it does tend to bring the national mode of doing business into disrepute, to see the houses chosen deliberately by the Administration for the transaction of its foreign business go rattling down among the very foremost in a stock panic. As we pointed out at the time it was made, in terms which many people thought too severe, the change was, certainly as regards Mr. Clews, a political job. Mr. Clews appeared on the surface as a banker only nine or ten years ago, and he has always been as much of a "worker" as a banker. It was to reward him for his political services that the Government business was given him, or, in other words, instead of the bankers' credit drawing the Government balance, the balance was given to help the credit, and the natural result has followed. It was curious and illustrative that Tom Murphy should have appeared on the scene immediately after the failure, and announced that "he would not have had it happen for $5,000," and that Senator Morton should have declared that "Henry's failure was the hardest blow the President had had yet." We trust it *was* very hard; would that it might confine every politician in the country to his bed for two months, and that it might induce "Henry" to let "the great party" alone, and occupy himself with his private business.

Although a great deal has been written and spoken during the past two weeks about "moving the crops," nothing at all has been heard from the farmers on the subject of cheap transportation. It seems unfair that the only people who really understand the question should, just at the moment when information is most needed, withhold it from the people. We had always inferred, from the speeches and resolutions of the granges and farmers' conventions, that what was wanted for cheap transportation was either the completion of the Fox River and Wisconsin Canal, or the building of a four-track steel-rail continental railroad from the corn-fields of the

West to the seaboard, or else the rehearing and reversal of the Dartmouth College Case by the Supreme Court; but it seems now that all that is wanted to move the crops is a little more currency. It would be a sad day for the bold yeoman of Illinois and Iowa if he were obliged to confess that, after all, it was becoming not so much a question of cheaply transporting himself and his crops, as of getting any transportation at all.

We predicted in the *Nation* at an early stage in this movement the very serious effect on the prosperity of the West itself which would be certain to result, in the long run, especially if it were encouraged by the newspapers and other advisers who ought to know better. The Chicago *Tribune* ridiculed what we said, and did what it could to fan the flames of the farmers' discontent by advising as a remedy for the existing evils the confiscation of a large part of the capital invested in the railroads. In this same newspaper we now find it stated that at the beginning of the panic eight Illinois railways were engaged in important works of construction, which would have "facilitated transportation, rendered travel safer, and living cheaper," but which now cannot be carried out. "The Lake Shore and Michigan Central were laying double tracks, mainly of steel, to facilitate the movement of our exchanges with the East. The Burlington, Rock Island, Alton, and Northwestern were also putting down large quantities of steel rails, and perfecting their magnificent systems of roads. The Illinois Central was assisting the Southern Railroad Association to form an all-rail route between Chicago and New Orleans, and several companies were endeavoring to bring coal much cheaper to Chicago. Owing to the difficulty of obtaining money, men are being discharged by the hundred, wages will soon be cut down, and the laboring classes are to be involved in much want and misery, or, at any rate, great immediate distress." The *Tribune* has what we must call the extraordinary boldness to explain this state of affairs by the "violent outcries" raised by certain individuals, whom it does not now distinctly point out, "against the corporations," and adds that "prominent railroad men" foresaw the crisis, but were powerless to avert it, because "only the hoarse cry, Down with monopolies! could gain the popular ear." "The multitude caught up the shout, and, accompanying it with fierce demonstrations, sent it across the sea, until capitalists, who were ready and able to advance the money the West needs and must have for its development, shrank from touching securities which the ambition of demagogues could at any moment render valueless." When a public counsellor in one month loudly demands confiscation, and the next refers to its own demand as the "hoarse cry of a demagogue," and to prove it insists on the very arguments it ridiculed a month before, we can hardly wonder at the wild language of those whom he advises.

Meeting in the midst of the panic, the Republican State Convention last week went through its business in haste and dulness, and adjourned at the end of the first day. Its ticket is a ticket for the less prominent State officers, and may be said to be fairly well made up. The name of General Barlow, the present Attorney-General, is dropped from the list, and the more zealous friends of the nominators and nominees assert as a reason for this that General Barlow had months ago declared emphatically that he was not a candidate for renomination. Months ago he was not. But that he was not, however unwillingly, a candidate when the Convention met, is an assertion which will not be made. The failure to secure his nomination would slightly mitigate regret for the failure of the ticket to carry the State should such be the result of the election. This, however, does not now seem probable. Mr. Silliman, who takes General Barlow's place, bears the reputation of being a good lawyer, but he is understood to be of a less aggressive turn than General Barlow, and of course, too, the probabilities are that the "ring suits" would be better prosecuted by a man who has had charge of them from the beginning than by a new man. Such was not to be the case, however; and why not may yet appear in the history of the suits in question. Mr. Silliman, it is just to say, was not the first choice of the men who are understood to have entered into certain agreements, express or implied, with Mr. William M. Tweed last autumn.

The platform of resolutions adopted at Utica was worse than such documents usually are. They are apt to be platitudinarian, and will have to be so no doubt till the end of time, and nobody will greatly object. But surely it has by this time become a shade too much to talk of the party's having "abolished slavery, crushed the rebellion, preserved the Union, established equal political and civil rights," etc., etc. And platforms, whatever else they are, need not record the spitefulness or personal animosities of one man. It is not the height of either magnanimity or good manners for Mr. Conkling to refer to the "several members of the small faction who recently deserted their party," etc., etc. This means that Senator Fenton, who is wise in his generation, some time since saw that there would be violent popular disapproval of the "back pay" enactment, and returned his money to the Treasury; while Mr. Conkling, less prudent or more wilful, refused to take notice of the storm until he found that nothing less than obedience would serve. He is now said to be the author of the resolution which condemns the action of Congress in passing the obnoxious measure. It, at all events, fits his personal case as precisely as if it had been made with a view of apologizing for his recalcitrancy. The resolution says that public censure is due those Senators and Representatives who took the money; that the Convention charges the wrong upon neither party—though, to be sure, more Democrats, relatively, than Republicans voted in favor of the increase of salaries; that the Convention gives its commendation to such Senators and Representatives as have refrained from taking the increase; that it thinks the true and only way of getting the money back into the Treasury is to wait until Congress has passed a law compelling such money to be "covered into the Treasury"; and that it requests our New York Senators and Representatives to see that such an act is introduced. A terrific enactment it will be, and greatly it will alarm gentlemen who have applied the money to hauling sand for their new houses, and otherwise "covering" it into their private exchequers.

The gossip about the Chief-Justiceship grows louder, and points more plainly than before to Mr. Roscoe Conkling as the probable nominee for the office. Indeed, gossip goes so far as to say that it is now at his disposal, but that he delays accepting it in order to see whether the result of the approaching election in this State will be such as to enable him to select his own successor in the Senate. The Boston *Advertiser* has performed, whether consciously or not we are unable to say, a somewhat ludicrous *reductio ad absurdum* on the appointment—if appointment it be—by looking into Poore's 'Congressional Directory' to see what Mr. Conkling's qualifications for the place are; and it pursues the investigation under the influence of the old theory that the Chief-Justice of the United States ought to be a great lawyer. It finds that he is forty-four years old; that at twenty-one he was elected State District-Attorney of Oneida County, which gave him a good run of criminal business; that at twenty-nine he became Mayor of Utica; at thirty a member of Congress for three successive terms; and at thirty-seven a United States Senator, which he still is. It is easily seen, therefore, that he has been most of his life in what is called "practical politics," and very little at the bar. The *Advertiser* is therefore not surprised to find that his name rarely appears in the reported cases of his own State, and that he has only appeared once before the Supreme Court of the United States; and that, in fact, his small practice has been that of a jury lawyer, and it cannot persuade itself that it is of such stuff as this that the President will make a Chief-Justice.

That Mr. Conkling is a man of ability, as the *Advertiser* observes, nobody can deny; but then there are all kinds of ability, and his ability is that of an ardent, indefatigable stump-speaker and party manager. Indeed, the stump has in our time produced no such fustian as he pours from it. When papers like the *Advertiser*

talk of his ability as a politician, it only shows to what base uses the word has come. To politics, in any good sense of the word, Mr. Conkling has not contributed a single useful or fruitful idea; he is not the author of a single measure of value or importance; he has made no speech which any sensible man can bear to read—so that his political claims to the chief place on the bench of the greatest tribunal in the world are as paltry as his professional ones. Indeed, there is in the very question whether a candidate for that place has had much legal practice, the most stinging exposition possible of his unfitness for it, under which anybody but a "manager" would wince and blush. The *Advertiser* feels hopeful that the appointment will not be made, and as hopefulness costs nothing, and in matters over which one has no control can do no harm, we share the feeling.

The Mixed Claims Commission has brought in its report, which wipes out every cause of difference, small as well as great, between Great Britain and the United States, as it covers all ground not touched by the Geneva Arbitrators. It awards $1,929,819 in gold, to be paid by the United States to England within a year, in satisfaction of all claims made against our Government by British subjects, and disallows all counter-claims by American citizens against England. The total amount actually claimed by British subjects was $95,000,000 nearly, so the award must cause a good deal of disappointment. But those who know how "claims" against a government are cooked up, will consider even $100,000,000 a moderate sum, in view of the fact that the period assigned to the Commission for examination was the five years between April, 1861, and April, 1865.

Readers of Mr. Nordhoff's book on California will remember his account of the feud between the farming interest and the cattle interest in Southern California. The struggle was as to which should prevail, and it turned on the point whether the farmers should be obliged to fence their lands at an enormous expense, or the owners of cattle to keep their stock within bounds. Hence arose the fence and the no-fence party in the valley of the San Joaquin, the former having for its latest champion in the Legislature one "Tom Fowler," who made it his business to oppose the passage of any bill prohibiting cattle from overrunning the growing crops in his neighborhood. The people of the Fourth Senatorial District have at last succeeded in defeating him. At the recent election, by a large majority, they chose in place of him Tipton Lindsay, a "no-fence man," and we presume this settles the question whether cattle-raising or agriculture shall be the predominant interest in Tulare, Fresno, and Kern counties. An extension to them of the provisions of the trespass law may shortly be expected, and we suppose there can be no doubt that the State will be the gainer by it, as it has been by the growth of agriculture and the decline or subordination of mining. It is noticeable that Fowler was rejected at the same election at which the railroad monopoly was so strenuously and so successfully opposed, although he had himself always voted against it, and sought to make capital by parading his "record" on the subject.

If, as is now talked of, a band of American Roman Catholics make a pilgrimage to any of the sacred places, it is to be hoped that they will recollect who they are, and their advantages of free education in our common schools, and not conduct themselves as the English and Scotch pilgrims are said to have done at Paray-le-Monial the other day. And the British devotees cannot say either that it was the bad Irish religionists in the party who made the disturbance, although the correspondent of the *Methodist* professes to have heard "the Hibernian brogue very distinctly" among the crowd of pilgrims as they waited at the railroad station in London. He is mistaken, and an inability to listen correctly to brogues he appears to add to the inability to count higher than 800 which the *Catholic Review* points out. He said in his letter that he thought there were no more than 800 pilgrims present, of whom one-half were women and a half of what was left ecclesiastics, while among the remainder the "Hibernian brogue was distinct" in his ears. The *Review* shows that there were between 1,200 and 1,500 pilgrims, and that the children of the Holy Isle, perhaps as being more excitable, were expressly shunted out of the English and Scotch party. It was not Irishmen, then, but Englishmen and Scotchmen, or men and women, who broke off whole branches of the sacred nut-trees near the shrine of St. Mary Alacoque, and scuffled for pieces of the same—all in a manner which has brought the French press out strong on the native brutality and vandalism with which the Englishman has been endowed by Providence—an endowment which leads him alike to knock noses off the statues of a pagan religion and to tear branches from the pious groves of the Christian faith. As a set-off to this rudeness, it is gratifying to find that politeness comes to the aid of sanctity with a new *robe à la prie-dieu*, and a bonnet to match. The skirt is of a severe neutral tint, ranging between slate and dove color; the mantle is cut *à la Carmelite*, and the bonnet shaped *à la béguine*. The back breadths being the most prominent, are frilled up to the waist, and some fancy is spent in giving the frills a pretty garniture not inconsistent with the religious aspirations of the wearer, who is peculiarly suited to the garb when she has a regular profile, a slim but well-rounded figure, and liquid eyes looking to advantage if cast up to a high-hung altar-piece.

Those who remember the terror inspired by the International Association during the two years following the Franco-Prussian war, and the eager interest with which philanthropists and reformers informed themselves about its history and aims, will be somewhat amused by the report of the last General Congress at Geneva. The body has undergone a complete change within two or three years. Those who figured most prominently in it before the siege of Paris have abandoned or betrayed it. Varlin, a leading French delegate, was killed during the Commune; Murat has completely gone over to the capitalists; Fribourg has become a contributor to *La Liberté*, M. Emile de Girardin's paper, and has written a book "exposing" his old associates; Perrachon, who figured prominently in the Commune, has gone back to his trade as a worker in bronze, a sadder and wiser man; Chemalé, who was an architect, has become a journalist; Tolain has basely become a member of the National Assembly, and is said to trouble himself about the labor problem no more; Richard has not only deserted the organization, but has become an ardent Bonapartist, and paid a visit of condolence to the Empress at Chislehurst. Of the Swiss leaders, Dr. Coullery has accepted a Government office, and keeps still as a mouse; Dupleix has withdrawn into obscurity; and the German organization is broken up. Odger and Lawrence, the principal English disciples, have long ceased to belong to the organization, in which Karl Marx and his friends got the upper hand at the Hague last year, leading to an irretrievable split into Centralists and Federalists, and the transfer of the General Council to New York, where one hardly ever hears of its existence, and where even the expansive Bradlaugh finds it necessary to snub and repudiate it.

The Congress at Geneva was, therefore, mainly officered by young and unknown men, but it was more harmonious, though not much less wild, than its predecessors. But nothing less alarming than the debates could well be imagined. The reports of the various "federations" were very mild affairs, and had little to tell except stories of strikes. The Spanish report was rather peppery, however, and put a new face on the disturbances in the various large cities, which were caused, it seems, by attempts at legitimate defence on the part of outraged workingmen. It is plain the International will not set the world on fire. There is too much human nature in man for any wholesale change in his condition. But it is worth recalling now, for future guidance, that a great many sober and sensible men were really impressed by the ravings at Bâle and Geneva, and had half worked themselves into the belief that society would have to be reorganized on the International plan, and that any world in which we did not *all* have parquet seats at the opera, and a triennial tour in Europe, was out of joint.

A FEW WORDS TO RAILROAD MORALISTS.

WE hope the present crisis will not pass away without bringing back to their sober senses at least a considerable proportion of the gentlemen who have helped in the ravings of "The Farmers' Movement." We notice a good many of them just now among the number of those who are railing against the railroad builders and are ridiculing Jay Cooke for trying to construct the Northern Pacific, and Kenyon Cox for advancing money to the Canada Southern, and Sheppard Gandy and Francis Skiddy for helping the Missouri, Kansas, and Texas. They can hardly find language strong enough to show up the folly and wickedness of those who have been engaged in the construction of these new lines. The country did not want them, they say, and prudent men ought not to have risked their funds in them, and thus brought this ruin on us all. There are several newspapers, which ought to know better, engaged in the production of this rather senseless talk, and these we would remind of a few health-giving facts in this wise: When you engaged in the wild part of the farmers' movement and began to talk of railroads as if they were public property, and of confiscating all stock which you did not think was properly issued, and of completing the spoliation of the unfortunate stockholders, already begun by the directors, your attention was distinctly called to the fact that railroads were built in the main with private capital, and that they were highly hazardous enterprises, in which men would not enlist for the mere chance of the ordinary profits on capital. Even where they received grants of land, the land was not of any immediate value, and all return for the investment was sure to be remote and slow. But you were glad to get the roads built on any terms, and eagerly encouraged people to build them, or, in other words, to embark in what has to most of them proved a losing venture.

Now, those who took your advice did exactly what Messrs. Jay Cooke and Kenyon Cox have done. They incurred great risks for the chance of extraordinary gains, and you thought they had done right and had acted in a manly, public-spirited, and American way, for which you were very grateful; and it never occurred to you to call their railroads "wildcat" enterprises or denounce them as gamblers or squanderers of the public wealth. On the contrary, you honored them as great public benefactors. Far from trying to limit or define their interest in the railroads, too, you tried both by your oratory and legislation to make it as large and unrestricted as possible. So far from talking of arbitrarily restricting their profits, you tried to make them believe that their profits would go beyond the dreams of avarice, and, by way of assuring them against hostile State legislation, you flaunted the Dartmouth College Case in their faces, with some grateful reference to the immortal Webster who argued it.

You will, therefore, see at a glance that it does not do for you now to turn round and revile the men who have risked their all and lost it in following your foolish and uproarious advice. It is, in particular, highly unbecoming of you, to use a mild word, to dwell with so much solemnity on the fact that the new railroads which have brought these gentlemen down, run out into the wilderness, or to insist, as you are doing, that railroads ought not to be made except through populous districts, or made at all till they are sure to pay. You know perfectly well that every American railroad running east and west had, when it was first made, one end in the wilderness, and lay through a sparsely-settled and non-paying country; and indeed you know, too, that it is these railroads which have peopled the West and produced those enormous masses of products of which you boast so much in your speeches and articles; so that, if capitalists had always acted on the rules now laid down by you for the guidance of "railroad speculators," there would not be any West at all, and some of its finest cities would be collections of "three-quarter camps." Moreover, if half the stories you have been circulating during the last six months about the enormous profits of railroads and about their extortions be true, railroading is about the very best business in which unscrupulous and far-seeing capitalists could engage. There may be moral, but there are no financial objections to building or running them. If you had chosen to look at the figures, you could have satisfied yourselves then that what you are now shouting so loudly is strictly true—that they were not, except when well and honestly managed, by any means profitable, even in a very small number of cases; but instead of helping to improve their management, and have integrity and purity infused into it, you lifted up your voices in support of a scheme of virtual confiscation, which, if you were successful in carrying it out, would not only produce a financial convulsion, to which the one through which you are now passing would only bear the relation of a light breeze to a tornado, but would stop all railroad-building in the United States for twenty years to come, and make it a country which capitalists would avoid as they avoid Spain or Mexico.

But this is not all. The public cannot permit you in silence to hold, at one and the same time, two opposing theories of railroad property. You must not run with the hare and hold with the hounds. If you have no respect for your own intelligence, you must at least feign a little for ours. You were all maintaining one month ago that railroads were public highways, from which stockholders were only entitled to what the State chose to allow them, and on which, indeed, as some of you held, every citizen ought to have the right of running his own car. In that case, persons who spend money in making new ones are contributors to the public welfare on a great scale; and when they ruin themselves, it is our duty, not to abuse them as bad business men, but to honor and reward them as self-denying and unfortunate philanthropists. If, on the other hand, railroads are private property, to be managed, within certain wide limits, on business principles, for purposes of gain, the efforts you have been making during the last half-year to excite popular indignation against them, to cut down their earnings, and make the stockholders the objects of hostile legislation, have been, pardon us the expression, of a thoroughly nefarious character.

One thing more. We are all sickened, and fully as much as you appear to be, by the frauds and impurities of railroad management. We are generally agreed that these things have done much to bring about that distrust of railroad property which has worked the present panic. You have yourselves made a good deal of fuss about it. But up to this moment you have suggested no remedy. There is nothing that would do more for "the transportation problem," and other problems of even greater importance, than legislation that would bring railroads under the control of all the stockholders, and make directors feel their responsibility to the owner of *each share*, and smart for concealment and misrepresentation and malfeasance of all kinds. But so far as we have heard, you are not busying yourselves with this great reform at all. Your main object seems to be to plunder the unfortunate stockholder of the little the directors have left him, by making him carry goods at such rates as will relieve Western corn speculators from the consequences of their own folly and extravagance. While sympathizing with you on the dulness of "the off-year" in politics, and on the difficulty with which exciting and interesting topics have been discovered since the election, we submit to your judgment whether, even in ordinary times, our social and political condition is not too serious for such light and reckless handling of great interests as that in which you have been indulging, and whether the trepidation and anxiety which you see on every side of you at the present moment are not an illustration of the delicacy and complexity of the great machine which we have to manage, and by which we live, sufficient to convince you of the value of caution and sober-mindedness.

PAPER MONEY AS A PANACEA.

A GOOD many of the admirers of an irredeemable paper currency have begun to admit, sorrowfully but frankly, within the last few days, that whatever other virtues this currency may possess, it does not possess the power of preventing panics, for we are now passing through a well-developed panic in the midst of general soundness in trade. They are, however, a little hasty, it seems to us, in making this confession, because their experiment has not been

tried under the necessary conditions. If they will recall their talk of a few years ago, they will find that the reason they gave for believing that inconvertible paper would protect us against crises was that, unlike gold, it could be increased indefinitely in quantity whenever the occasion called for it. Panics, they said, consist in the sudden withdrawal of money from circulation; if money can be supplied in sufficient quantity to fill up the vacuum, the panic passes away; when the money is gold coin this cannot be done, but if the money be paper it can be done. Therefore, in a country in which paper is the legal tender, all that is necessary to meet a panic is to issue more paper. This is in a measure true. If people are frightened, and hoard their legal tenders, the immediate inconvenience can be avoided by issuing more of them. But by each issue you stimulate the spirit of speculation out of which panics are bred, and you find not only that each successive panic has to be met by a larger issue, but that panics recur oftener, so that at last your remedy loses its power. It is, as has been often pointed out, the old story of "keeping up the strength" with brandy.

The friends of irredeemable paper have, however, no occasion to feel disheartened by what is now occurring. Their plan of restoring confidence cannot be tried, because nobody has been armed with power to try it. Nobody has any legal authority to stifle a panic by fresh issues. Our present currency is, therefore, even less capable of meeting a crisis like the present than gold, because it is more limited in quantity. Accordingly, we are witnessing the extraordinary spectacle of people hoarding paper money in a time of general distrust, and the banks, after thirteen years' suspension of specie payments, suspending paper payments also, and forcing the business world to use private checks and other "tokens." No higher compliment to the credit of the Government could well be paid than is paid by this spectacle; but, then, what a curious illustration it furnishes of the shiftlessness of our financial legislation!

The jubilation of the friends of specie payments is, however, almost as unjustifiable as the despair of the votaries of paper. There is no foundation that we know of for the notion, which many journals are preaching, that, if we had a redeemable currency, panics such as we are now witnessing would not occur. How anybody can propound such a doctrine in the teeth of the experience both of this country and of England, we do not understand. The greatest panics of the century have occurred on a "specie basis." The most radical and destructive panic of our history, that of 1857, occurred when all bank paper was as redeemable as bank paper is ever likely to be. Do not let us, therefore, while exposing the vices of our present currency, pretend, like quacks, that we know of a financial panacea which will make such crises as that through which we are now passing impossible. There is no such panacea in trade any more than in medicine. Panics have their origin in human nature, and will recur as long as man remains man; we may render them rarer or less destructive, but we cannot entirely prevent them, and this for reasons that may be easily stated. They admit of classification based on their extent, but they are in their origin and nature all the same. They all have their origin in a sudden fear that debtors will not pay what they owe, whether the debtors be banks or private individuals. Sometimes this fear arises out of the sudden discovery that production in some particular field has been overdone, or that undue expectations have been entertained as to the value of certain commodities, or out of the sudden discovery of weakness or dishonesty in some concern of unusually high character; but the fear in every case produces precisely the same effect: it leads men instantly to stop from entering into contracts and to take into their personal possession—or, in other words, to hoard—all the money they can command. The result is scarcity of money and paralysis of trade. In countries like England and America, in which nearly all business is done on credit and banks of issue supply a large proportion of the circulating medium, and in which the industrial activity is very great, of course the results of such occurrences are terribly disastrous.

Now, there is only one way of meeting such crises, and that is by pouring into the banks such an additional supply of money as will keep the wheels of business revolving and prevent any serious pinch being felt, until the country has got over its fright. This has been proved again and again, particularly in English experience, in which panics have been more common than in ours. It was peculiarly well illustrated by the panic of 1866 in London, which in many respects resembled that through which we are now passing, inasmuch as it was caused by the sudden failure of Overend, Gurney & Co., a house in whose wealth and honor the public had the utmost confidence. There was at once a wild rush of depositors to banks and trust companies, and people began shouting, "If the Gurneys are not sound, whom can we trust?" just as people here have been shouting, "If we cannot trust Jay Cooke & Co. and the Union Trust Company, and so on, whom can we trust?" The Government at once permitted the Bank of England to issue notes beyond the $70,000,000 limit, and the result was the panic ceased as if by magic, although in point of fact the Bank did not issue any new paper whatever. Now, what happened in this case was simply this: The Bank said to the public, that hoard as it might, or withdraw its deposits as it might, the vacuum would be filled by fresh funds, and the merchants would obtain their discounts all the same, until the fright was over. Everybody, therefore, feeling satisfied that he could have his money if he wanted it, ceased to want it. Of course a "credit panic," as it has been called—that is, a panic like that of 1846 in England, caused by a tremendous failure in the harvest, or like that of 1857 here, caused by general overtrading, and producing widespread insolvency—cannot be checked by a summary process of this kind, but it may be greatly mitigated. This amounts to saying that a panic is really a mental rather than an economical phenomenon, and has to be dealt with by remedies addressed to the imagination, which is the plain truth of the matter, although it is obscured by a good deal of financial cant.

No matter, therefore, what currency we may have, there must be lodged somewhere in our banking system the power to meet panics by temporary expansion, and it must be a power capable of being used promptly and with decision. In England, it is lodged in the Bank of England, which, under letters of license from the Government, either prevents panics or prevents their spread. Sometimes this is done, as in 1846 and 1857, by affording timely aid to houses such as Brown, Shipley & Co. and George Peabody, whose fall would spread universal terror and confusion. It is safe to say that, under such a system here, either Jay Cooke & Co. would have been helped through their difficulties, or the stoppage of Henry Clews & Co., which renewed the alarm on Tuesday, would have been prevented. Sometimes, of course, as in the case of Overend, Gurney & Co., the affairs of even a great house may get into such a condition that, however great the dismay its ruin may be likely to cause, it ought not to be prevented. When this occurs, the only thing to be done is to confine the panic within as narrow limits as possible.

Now, there is little chance, even if it were desirable, of the establishment of any great regulator, such as the Bank of England, in this country. It could not fix the rate of interest for the whole country, as the Bank of England does. But it seems very clear that the proportion of paper to coin in our circulating medium is to be increasingly large, and that, in other words, the welfare and prosperity of the country, and its immunity from great commercial disasters, will every year depend more and more on the condition of our banking system. If panics are to be repressed, and the legitimate business of the community to be carried through trying crises, it is the banks which must do it; and to do it, they must be armed with the power, under certain circumstances and conditions, to increase the volume of the currency. At present, our banking system, elaborate as it is, has not only no provision for one of the most dreaded contingencies of commercial civilization, but it is actually forced into restricting the supply of money when money is most needed. When the recent demand for a temporary supply of more money came upon us, it was found that nobody had authority to supply it; and, though the conduct of the banks has been admirable, they have shown that they are, under the present system,

utterly unequal to the occasion, and Secretary Richardson's attempt to relieve them by the sale of bonds has simply resulted in adding $13,000,000 more greenbacks to the stock of the hoarders. It ought not to be necessary, at this time of day, to hold long consultations as to what ought to be done when the alarm caused by the failure of a great house threatens us with a commercial crisis. The machinery for dealing with such a contingency ought to exist, and be ready for instant use, as a fire-engine is. If it had been, the present panic would have ended on the second day. It is to be hoped that the supply of some such machinery will be one of the first pieces of work done by Congress next session, but it is as well to say that nothing of the kind can be devised in which the redeemability of paper does not play the leading part. No expansion on the part of banks can be permitted which is not checked and controlled by liability to have the paper returned for gold when the storm is passed; and it is a fair question whether some such restriction as the obligation to charge 10 per cent. discount, recently proposed by Mr. Lowe, on all unusual issues, ought not also to be added. The way in which the banks of this city have combined during the present crisis affords also a useful hint towards the construction of the *modus operandi*. The whole subject is one of vast importance, and strikingly resembles that on which a good deal of public attention has recently been bestowed—the best mode of saving cities from fire. It cannot be got rid of by abusing brokers and speculators. Brokers and speculators there will always be; and, when they fail or miscarry, they spread ruin among the innocent. The business of government is not to make the world perfect, but to make its imperfections as innocuous as possible.

THE FRENCH SUCCESSION.

PARIS, Sept. 11, 1873.

A SUPERFICIAL observer would believe that France is now absolutely calm; but under this apparent torpor the most profound and almost painfully active passions are at work. France feels herself drifting, as in an irresistible current, towards the future, without having the force to direct her own movements; a superior will seems to direct her, to destroy her hopes, to humble her pride, to choose her for a mere instrument. The country of Voltaire sends thousands of pilgrims to Paray-le-Monial, to Lourdes, and to La Salette. The captive of the Vatican still considers Revolutionary France as the "eldest daughter of the church." The motto of the Revolutionary days, "Liberty, equality, fraternity," is still seen on the walls, but the faith in the principles of 1789 has nearly died out in every heart. Renan, who is probably the most advanced representative of free thought, has no other advice to give to his country than to renew the pact with its old dynasty; just as Strauss, in his 'Old and New Faith,' throws Germany at the feet of the Hohenzollern. The Commune has destroyed our faith in fraternity. We have become Darwinians in politics, and ceased to believe in equality. Liberty needs the protection of the state of siege; and every day we hear of the suppression of some newspaper, of the interdiction of some meeting. The whole fabric of the old Liberal school has fallen to the ground, and some reluctantly, some with an eager impatience, Republicans as well as Monarchists, all call for a strong government. We cannot even complain that the obstacle to the establishment of a free and progressive government comes from the outside. It is hard to submit to force, but force does not dishonor its victim. Jules Favre had promised, in the name of France, not to abandon a stone of our fortresses nor an inch of our territory; and the German flag floats on the walls of Strasbourg and Metz. Paris, by the mouth of Trochu, had sworn never to capitulate, and German battalions have camped in the Champs Elysées. We have lost the illusion of our invincibility, but this illusion was crushed by the brutal hand of the enemy. What shall we say of so many other illusions which are gone also? How many idols of popularity have become objects of pity and contempt and hatred! France feels almost as much irritated by the consciousness of her moral impotence as by the memory of her defeats. She has been surprised at her own sterility. She has looked in vain, in her troubles, for one of those born conductors of men who can, at a given time, express all the aspirations, the hidden instincts, the hopes of a people. She has tried Gambetta, and found him empty; she tried Thiers, and for a moment she believed that, under his guidance, she could find her way towards a stable and conservative republic. This illusion also seems to be gone. And when Paris preferred Barodet to Rémusat, when Lyons sent to Versailles a soldier of the Commune, the country saw what M. Thiers would not see, and understood that the so-called Conservative Republic was merely like the curtain of a theatre, and that on the stage the Communists were already preparing their lists of hostages and forming their platoons of execution.

The parliamentary revolution of May 24th became the signal for a complete revolution of ideas, and all eyes turned again towards the Monarchy. The word Republic, to be sure, was officially preserved, but nobody understood better than the Republicans themselves that the Republic of the present day was threatened with the same fate as the Republic of 1793 and the Republic of 1848. The country became at once conscious that a great change had taken place. As soon as the Assembly separated, the Comte de Paris went to Frohsdorf, and declared to his cousin, the Comte de Chambord, that if the Monarchy was established in France, the eldest Bourbon was the only representative of the hereditary principle; that he was not himself a pretender to the crown, and that he would give the same assurance for all the members of the Orléans family. This visit is said to have moved the Comte de Chambord; it took him by surprise, as the Comte de Paris came alone and without having entered into any previous negotiation. The reason of it is obvious. The Comte de Paris was unwilling to enter into any political discussion with his cousin; he had no other object than to withdraw himself from the field of pretenders, and to mark, by a solemn act of abnegation, the necessity of uniting the monarchical parties. His silence on the constitutional question, on the question of the flag, indicated implicitly that he considered all such questions as belonging to the competence of the National Assembly. Nobody witnessed the interview between the grandson of Louis Philippe and the heir of Charles X. We only know that it was "cordial"; but it is not difficult to imagine what memories and thoughts must have surrounded the two interlocutors. The mere announcement of the meeting was an event in itself. The number of political solutions is not an indefinite one; and one solution was, as it were, withdrawn. The Comte de Paris is a good observer. He has seen, since he has been allowed to live in France, that the old Orleanist party was disorganized. He had neither the means nor perhaps the wish to rule it with a strong discipline. He saw such men as M. Thiers, Rémusat, Dufaure, who had been the ministers of his grandfather, now the leaders of the Republican party; while some Orleanists had joined the ranks of the Democrats, others had gone over to the Legitimist side. There was no fixed principle, no cry which could rally the Orleanists. They were the representatives and supporters of a constitutional monarchy; but Louis XVIII. had been a constitutional king, and the Comte de Chambord was not obliged to imitate Charles X. It probably was a painful sacrifice for the son of the Duchess of Orléans, for the grandson of King Louis Philippe, to go alone to Frohsdorf in Austria, and do, as it were, homage to the King of France out of France. But the necessity of a solution was felt by everybody, and there was a permanent danger in the division of the Monarchical party. There were three pretenders to the throne of France; two only are left. The Comte de Paris has taken his place as the Dauphin behind the Comte de Chambord. The Right and the Right Centre of the Assembly, which together placed Marshal MacMahon in power, will now be able to work harmoniously together, and will no longer be so dependent on the small nucleus of Bonapartists who sit in the Chamber.

The *fusion*, as it is called, has contributed to simplify the political problem; but I do not consider it as solved. There are still two pretenders, and France may still have to choose between the Empire and the Monarchy of Henri V. It is not one of the less eloquent proofs of the moral impotence of the country that the Empire, after Sedan, after the loss of Alsace, should have preserved a certain vitality, if I may so express myself. But it would be idle to deny that in the eyes of many the Imperial system has many of the advantages of the Monarchy, without many of the faults of the ancient régime. It can preserve order, and it does not wound the morbid love of equality which was engendered by the great Revolution. The Empire can give satisfaction to the most cherished aspirations of the Catholic clergy without becoming a visible instrument and tool of the Ultramontane faction. The roots of the system have gone very deep in the subsoil of the nation. The material prosperity of the country was so increased during the eighteen years of the Empire that the payment of a ransom of five milliards was almost too easy. A tragic succession of events has brought to the front the old monarchy of France, surrounded with all its associations and memories; but the dialogue between the descendant of Henri IV. and Louis XIV. and the new States-General has not yet begun. The Comte de Paris has gone like a herald to the King; but the King is silent, and nobody knows what will fall from his lips. His former declarations have been imprudent, but it may be that the terrible responsibility which now hangs over him will inspire him with moderation and with wisdom.

If a new marriage takes place between France and the historical house of Bourbon, it will be what the French call a marriage of reason. The example

of Spain shows what becomes of a nation which has grown under monarchical institutions when the ties of a national dynasty are broken. The communion between the Hohenzollern and Prussia, between the Hapsburgs and Austria, between the House of Savoy and Italy, between the successors of William the Third and England, furnishes examples which cannot be lost in Europe. Even Belgium owes something to a dynasty, though the Coburgs have so far only furnished two kings to the new kingdom. But these very examples show that there must be a community of feelings and of principles between a country and its dynasty. The principle of a modern monarchy is no longer a divine right, but the historical right of utility. Unfortunately, the Comte de Chambord cares less for the principle of utility than for his divine right. He dwells on the Sinai of royalty. There is something miraculous in his eyes in the succession of events which have imposed him, as it were, on the French people's attention. He is, therefore, not likely to conduct himself by the ordinary rules of prudence. He has nothing to do but to wait till the miracle is completely worked out. He can say *"non possumus"* with a quiet heart, like the prisoner of the Vatican, to all those who ask him to make any concessions to liberalism. He has to say but a single word to re-establish a constitutional monarchy in France, and perhaps he will not say it. His objection to the tricolor flag is the most serious difficulty, for the nation understands better the value of a symbol than the articles of a constitution. The white flag means the *ancien régime*, and the *ancien régime* is, for the masses of the people, equivalent to slavery. It means poverty, oppression, arbitrary taxation, government by priests and by noblemen. The tricolor means equality of rights, and the love of equality is the prevailing passion of the country.

If the obstacles which stand between the nation and the representatives of the old dynasty are not removed, great and new dangers will arise for France. There is such an impatience of a solution, the currents of public opinion are so irresistible, that the Chamber will be forced, as soon as it returns to Versailles, to meet the great constitutional questions which have so long been deferred. A proposition will be made immediately for the re-establishment of an hereditary monarchy. Some negotiation must then take place between the leaders of the monarchical party and the Comte de Chambord. He may consider himself as the sovereign *de jure;* but he is not on the throne, and the National Assembly is sovereign *de facto.* There are in the Chamber a hundred deputies who will follow their king under all circumstances; but out of the actual majority of four hundred deputies, there are three hundred Monarchists who will claim for the Chamber the right to make the monarchical constitution. If these three hundred deputies receive no satisfaction, they will content themselves with making a sort of monarchical establishment without a king; and as the character of Marshal MacMahon commands universal respect, they will give him a lease of executive power for two or three years more. France will be then what it is now—a Republic with monarchical leaders; and this state of things can be prolonged almost indefinitely, till the Comte de Chambord abdicates. Such is the plan of the Constitutionalists. It is open, of course, to many objections. The young Prince Imperial will become a man during the interregnum, and the Imperialists will gain all that will be lost by the Royalists. As long as the name of Republic is preserved, the Republicans will preserve legitimate hopes, and their propaganda will be unceasing. France, without a settled future, will become the prey of factions. Even if material order is maintained, there will be no moral order, no common belief, no common principles. The present calm is perhaps only one of those hours of silence and torpor which interrupt the furies of a cyclone.

Correspondence.

MR. GREELEY AND MR. LINCOLN.

To the Editor of the Nation:

Sir: Turning over some old letters the other day, I came upon one from Mr. Greeley, which illustrates his relations to Mr. Lincoln and his Administration. I simply premise that Count Gasparin had sent to my care an appeal for the renomination of Mr. Lincoln on the ground of the moral support which his re-election would give to our cause in Europe. This plea I sent to Mr. Greeley, with the request that he would publish it in the *Tribune*, and I received the following reply. The italics are Mr. Greeley's:

"New York, April 6, 1864.

"My Dear Sir: I see that those who know least about the way things are managed at Washington want Mr. Lincoln renominated, and I presume they will have their way. I match their judgment with that of Congress, whereof not one-third of the Unionists desire Mr. Lincoln's renomination, and not half can be constrained to seem to oppose it, even by the terrors of popular reprobation. Count Gasparin, 3,500 miles away, is naturally even more decided and zealous than Connecticut; were he 10,000 miles away, he would be still more so.

"I am not accustomed to allow majorities to dictate my opinions; if I were, I should be among the new converts to abolition, and share their choice for President. But having seen and *felt* too much during the last three mournful years, it seems *my* duty to favor the nomination of some one who *will not* go through Baltimore in disguise and darkness when he goes to be inaugurated, and who *will* cause the Mayor and Young Christians of that city to be kicked out of the White House whenever they shall dare propose that troops be forbidden to cross the territory of Maryland to defend the Federal metropolis. Had the three first Generals that proved treacherous or cowardly been shot on sight thereafter, we should long since have seen the end of the Rebellion, says yours, Horace Greeley."

Perhaps you will think this letter worth printing. S. P.

Notes.

Shepard & Gill, Boston, will reprint Edward Clodd's 'Childhood of the World,' a work which has been praised in some quarters for its simple account of prehistoric mankind, and as fit reading for children and for adults. ——We are requested to say that "one of the four members of the Law Faculty of the University of Louisiana occupies the position of Professor of Roman Law, and that system of law is there taught as part of the required course. The student upon graduating is supposed to be familiar with the following text-books: 'Institutes of Justinian'; Mackeldey's 'Compendium'; Domat's 'Civil Code'; 'Pothier on Obligations'; and 'Marcadé on the French Code.'" This correction of our somewhat too sweeping statement in our article on the study of Roman Law is, like the correction from Yale already printed, more technical than real; though we should suppose that in Louisiana, where the civil law has been inherited from the French rule, instruction in it would be more genuine and profitable than anywhere else. The question is whether, no matter what college programmes say about required studies, the profession is appreciably benefited by existing courses in Roman Law.

—Dr. John Cotton Smith's paper, *Church and State*, has just been strengthened by the addition to its editorial staff of Dr. William Steevens Perry, Secretary of the House of Clerical and Lay Deputies, who will have charge of the news department. Dr. Perry is the editor of a series of works to which some of our readers will perhaps be glad to have their attention directed, of which a part is published, while a prospectus of the rest, accompanied by one of the handsome specimen pages, is now before us. The work bears the general title of "The Historical Collections of the American Colonial Church," and the portion already published, or rather privately printed —for only two hundred and fifty copies of each volume of the set are allowed to be issued—consists of the Colonial History of the Church in Virginia, in Pennsylvania, in Massachusetts, and, so far as we gather from a resolution of the House of Bishops in 1868, in Connecticut also, although the prospectus would appear to leave the Connecticut Annals still awaiting print. That, however, an intending subscriber can probably learn from Dr. Perry. In general, we may say of the Annals that they will be of interest not only to Churchmen, but to the collector of choice books, and to a more important reader—the historical student. For "from the fact that the church was 'established' in several of the Colonies, and from the frequent mingling of political matters with ecclesiastical affairs in the controversies rife a century since, these documents often throw light on subjects of general interest, as they continually do on matters of local moment. They comprise unpublished letters of the Colonial and Provincial authorities; sketches of the organization of our oldest parishes, written at the time; details of persecutions incident upon the introduction of the church among those who were hostile to its teachings and jealous of its growth; references to the events, since become historical, then transpiring within the writers' personal observation; and reports of the old missionaries, giving with all the freedom of private correspondence the impressions of educated men, graduates of the English, Scotch, and Irish Universities, or else native born and bred, concerning the manners, morals, and conduct of our forefathers for the century preceding the War for Independence."

—The Trustees of the Metropolitan Museum of Art reopened it yesterday in their building, at 128 West Fourteenth Street, just beyond Sixth Avenue. By a new arrangement, any one paying to the Museum a subscription fee of ten dollars will receive a personal ticket of admission, good for one year, and also eight single tickets, which will be transferable. Except on Mondays, which will be free days, the regular price of single tickets will be twenty-five cents, for the heavy expenses incident to moving into the new premises and arranging them have compelled the Trustees to forego their intention of making tickets gratuitous throughout the week. Since the closing of the Museum last summer, several important improvements have

been made: the collection of pictures by old masters has been moved down to Fourteenth Street from the old premises in Fifth Avenue; that portion of the Di Cesnola Collection not previously displayed is now ready for exhibition; additions have been made to the fine Loan Exhibition, which has never been equalled in this country; catalogues of a portion of the collection are now ready, and others are in preparation.

—On Saturday last the authorities of Brooklyn set up in Prospect Park a bust of John Howard Payne—one of the numerous company of "poets of one poem" who are so little known, if we compare their personal fame with the widespread knowledge of their works. With Payne this is peculiarly the case, for few poems in the language are better known to more people than 'Home, Sweet Home,' and few people who so much as know the author at all know more of him than the often-quoted saying that "the author of 'Home, Sweet Home' never knew what it was to have one"—a saying which we may probably set down as to some extent mistaken in its pathos. It is so far true that Payne, although a man of extraordinary personal attractions, and of an intellect and disposition not unworthy of his person, never was married; and that in the course of his time he wandered more than most men. Be that as it may, the American authors are wonderfully few to whom a memorial bust would be awarded by a vote so nearly unanimous. It is to the Faust Club of Brooklyn that Prospect Park owes this work of art.

—In describing the Italian Maritime Hospitals for children the other day, we overlooked, it seems, a similar charity, which has already been in successful operation for two summers, thanks to the liberality of the Philadelphia ladies and gentlemen who last February obtained an act of incorporation for the Children's Sea-Shore House at Atlantic City. The first summer, as we learn from two circulars which have been forwarded to us, a cottage was rented and equipped for the comfortable maintenance of a dozen or so invalid children, under the charge of a competent resident physician and capable female assistants. The success of this experiment was so marked (twenty-seven children having been entertained during the summer, with the greatest benefit to their health) that a lot was purchased at Atlantic City, and presented to the "Children's House," running to the sea, with a depth of 800 feet, and a width of 150, on which buildings were put up designed to accommodate fifty or sixty children, and estimated to cost about $12,000. We are informed that the whole expense of them, as well as the current expenses of the institution, has been provided for. Perhaps this does not mean that contributions from the benevolent would be declined as superfluous, and any one who is interested in helping on the enterprise would do well to correspond with the Secretary and Treasurer, Mr. J. Shipley Newlin, 1018 Clinton Street, Philadelphia, who will doubtless also take pleasure in informing persons in other cities adjacent to the sea-shore of the details of management of the "House." We may note here that Atlantic City is sixty miles from Philadelphia by rail, or one hour and three-quarters in time, and that the railroad company carried the patients and their necessary companions or nurses at half-price.

—There lies before us, as we write, a copy of the London *Times*, dated Friday, May 16, 1794, price fourpence half-penny, London, printed for C. Bell, Printing-house Square, near Apothecaries' Hall, Blackfriars. The journal still retains the site of its old residence. The *Times* had been issued at that time about nine or ten years. Our copy is a small single sheet, which, when you open it, measures one of the leaves of to-day's New York *World*. The printing is carefully executed, but the type is worn and thin. The contents briefly set down are highly interesting, and the advertisements furnish a résumé of the habits and manners of the Englishmen of that date almost as ample, reliable, and attractive as would intimate personal correspondence. The mother country was then undergoing the throes and perils of a very critical existence, and had even been promised by the French Directory and the "Friends of Man" to be snuffed out, or at least to become an apanage of the great universal republic. The days were indeed dark, for the auxiliary English forces in the Low Countries contending against France were commanded by the Duke of York, young, ignorant, headstrong, obstinate, but the king's son. There are despatches from Manheim, Brussels, and Genoa of the movements of the French armies on their crusade against monarchy everywhere. There is the customary report of the sitting of the French National Convention, dated May 4, with a paragraph commemorating M. Bourdon de l'Oise and his gasconading commendation of the army of the Ardennes. "The infantry of the army of the Ardennes has charged and defeated the enemy's cavalry, a circumstance which had not been paralleled in fourteen centuries. On this occasion the French soldiery had outdone the example afforded them by the warriors of Cæsar's legions, which had been many years in disciplining before they had achieved their glorious conquests, while the French Republic had had two years only to train the battalions that had twice in one day charged the enemy's cavalry and as often defeated them." M. Bourdon is to be excused for knowing nothing of the London trained bands, with their pikes, in Cromwell's days, but he might have remembered the Spanish infantry at the battle of Pavia and the charge at Blenheim. Under the heading of Paris, May 5, is the following terrible despatch: "The revolutionary Tribunal has just sentenced to death the following individuals of the classes of Aristocrats and Moderates"—the Marquis de Choiseul de Beaume, aged 61 years, and a score of other ex-rebels, brokers, soldiers, magistrates, mostly past middle life. The Parliamentary intelligence is very terse, and the only item of general interest which we care to excerpt concerns the "trial of Warren Hastings, Esq.," which was to be resumed "on the following Monday after an adjournment on account of the indisposition of Mr. Fox." "The Committee of Secrecy of the House of Commons" is busy investigating the correspondence "which has recently been discovered in the possession of those persons lately apprehended by order of Government." The members of the Privy Council were also "engaged during the day in examining into and arranging the papers found in the possession of the persons taken up." "Treasonable correspondence with the enemy," "Improper correspondence in this country, tending to produce a change in the mode of representation," appear to be the charges against the unfortunate *détenus*. And as additional evidence of the tight hand held by the king and his ministers over "his beloved subjects," in those wild times, there comes the assurance, "A bill no doubt will be brought into Parliament to make it high treason for any body of men to meet in societies, delegated for the purpose of altering our present constitution."

—The condition of the poor, or rather the treatment of the poor by the officers entrusted with the administration of relief, is illustrated by a criminal information moved for by Mr. Erskine in the Court of King's Bench. The overseer and beadle of the parish (not stated) "are very active parish officers, and the complaint against them is this: In order to prevent a child having a settlement in that parish to which they belong, and to prevent the infant being born there, they put the mother in an open boat, with the pains of labor upon her, in the presence of the midwife who had come to deliver her. And when the midwife said that this woman would be delivered in the boat, the defendants, who are superior to any weakness of that nature, replied, 'What although she is delivered in an open boat! That is no extraordinary circumstance.' This poor woman was forced into the boat with the pains of labor upon her, and fortunately arrived at the parish of St. James, Clerkenwell, where the child was born, and has become chargeable to that parish." The chances are that the overseer and beadle belonged to a parish on the south bank of the Thames, in London, and that the unfortunate mother was taken over in the boat to the north side, a part of which used to be included in the parish of St. James, Clerkenwell. The Lord Chief-Justice advised that an indictment was preferable to an information for an offence of so very serious and aggravated a nature.—Among the miscellaneous communications there is one to the effect that "Tom Paine, in publishing his creed, has at last eased his friends of one doubt: they before took it for granted that he had no belief at all. His mind, he tells us, is his church, and we most sincerely rejoice that his congregation is dropping off so rapidly." Naturally enough, there is a story of one of those marvellous instances of longevity, so dear to old newspapers, one, too, which has not passed before the acute dissecting powers of Mr. Thoms. "We are informed from Abbey Laddercost, in Cumberland, that a woman called Jane Forrester, who lives in that parish, is now in the 138th year of her age. When Cromwell besieged the city of Carlisle, 1645, she can remember that a horse's head sold for 2s. 6d. before the garrison surrendered. At the martyrdom of Charles I., she was nineteen years of age. At Brampton, about six years ago, she made oath before the Commissioners in a chancery suit to have known an estate, the right of which was then disputed, to have been enjoyed by the ancestors of the present heir 101 years. She hath an only daughter living, aged 103. And we are further informed that there are six women now living in the same parish where she resides, the youngest of whom is 99 years of age." Unhappily for the correctness of the old woman's assertions it is quite certain that if Mrs. Forrester was 19 years of age in 1649, when King Charles was executed, she would have been at the date of the newspaper, 1794, aged somewhere about one hundred and sixty-four years.

—The analogy between the body politic and the human body is of very old date. In poetry and orations and sermons, it has always had a conspicuous place; though, as a general thing, it is an analogy which has rather been used to warn and terrify than either to cheer or enliven. It has been often used to prove that all human societies must have their periods of youth, maturity, and decay, as the individual man has his; and many exhortations to social humility have been pointed by analogical allusion to the fate of

Rome and Greece, Egypt and Persia. It makes little difference to what quarter of literature we turn; it was Dryden's fancy that,

> "When empire in its childhood first appears,
> A watchful fate o'ersees its rising years,"

and in the latest magazine article we take up we find it stated that "in an able American work, Draper's 'History of the Intellectual Development of Europe,' the theory of a close analogy between the growth and decay of nations, and the birth, maturity, and death of the individual men who massed together compose nations, is curiously set forth and followed out: too elaborately, perhaps; but the ingenuity of Mr. Draper's argument gives interest to his work, and leads the mind into other contiguous fields of meditation. 'A national type,' says the historian, 'pursues its way physically and intellectually through changes and developments answering to those of the individual, and being represented by Infancy, Childhood, Youth, Manhood, Old Age, and Death respectively.'" The analogy was no doubt suggested in the minds of those who first made use of it by the apparent fact that all the great human societies of the past arose from small beginnings, passed through a period of active warfare with the world, and, having finally established themselves as independent social organizations, soon began to decline, finally to grow decrepit and moribund, and in the end disappeared, to give way to some new power. Mr. Herbert Spencer, in one of the papers on "Sociology" which are appearing in the *Popular Science Monthly*, has revived the analogy, which he says is founded on truth, and makes a curious attempt to place it on a scientific basis, and to show in this way the necessity of biology, or the science of the life of the individual, as a preparation for sociology or the science of social life.

—Figures of speech, Mr. Spencer says, which very often mislead by conveying the notion of complete likeness where only distant analogy exists, occasionally mislead by making an actual correspondence seem a fancy. A metaphor, when used to express a real resemblance, raises a suspicion of mere imaginary resemblance, and so obscures the perception of intrinsic kinship. It is thus with the phrases "body politic," "political organization," and others, which tacitly liken a society to a living creature; they are assumed to be phrases having a certain convenience, but expressing no fact —tending rather to foster a fiction. "And yet metaphors are here more than metaphors in the ordinary sense. They are devices of speech, hit upon to suggest a truth at first dimly perceived, but which grows clearer the more carefully the evidence is examined." Mr. Spencer proceeds to examine the analogy in detail. In the first place, "mutual dependence of parts" is the very essence and principle of all organization. Beginning with protoplasm, which belongs to the lowest grade of living things, we find that this substance has no distinct faculties, is capable of but the feeblest movement, cannot adjust itself to circumstances, and is in fact at the mercy of fate. Gradually this unorganized mass becomes organized by changes, through which the parts lose their original sameness, and assume different kinds of activity, for which their positions and circumstances fit them. This process goes on until the differences become numerous and striking, and the organization reaches a high state of perfection. Now, exactly the same thing is true of social development. Primitive tribes are in the same amorphous, protoplastic condition that mark the beginning of our individual fellow-citizen. At first all men carry on the same kind of activities. They hunt, fish, eat, and sleep all as one man. They are not dependent upon one another. There is not even a settled chieftainship. From this state there is a gradual development, familiar to all students of political economy, which results in permanent social structure. This, however, is by no means all: the two metamorphoses have a cause in common. If we begin with an animal or a tribe, in its protoplastic condition, and enquire in what way the change must begin, we see that "evidently each part can abandon that original state in which it filled for itself all vital needs, and can assume a state in which it fulfils in excess some single vital need, only if the other vital needs are fulfilled for it by other parts that have meanwhile undertaken other special activities." The lungs cannot devote themselves exclusively to breathing unless other portions that have become exclusively occupied in absorbing nutriment give them a due supply. That is to say, without "exchange of services," animal organization is impossible; but this is also true of social organization. If the primitive member of a society just emerging from its protoplastic condition, who has been in the habit of making his weapons of the chase, as well as using them to obtain his food, is to spend his whole time in making weapons, it is obvious that he must be supplied with the produce of the chase by some one else in exchange for the weapons he makes. If he becomes a cultivator of the soil, and no longer defends himself, he must be defended in his occupation "by those who have become specialized defenders." This is only the beginning of the resemblance, which we have not space to trace further. Mr. Spencer arrives thus laboriously at some curious practical conclusions, for which we must refer the reader to his article.

—A correspondent at Berlin gives from his personal knowledge two incidents which, though trifling in themselves, serve to show that Prince Bismarck is not out of favor with the Emperor. On the occasion of the unveiling of the monument of Victory in the Thiergarten, September 2, the generals saluted the Emperor on his arrival, according to an old Prussian custom, by kissing his hand. When he had thus received the homage of his lieges, and had fulfilled the routine of military etiquette, the Emperor turned to Bismarck (who had just arrived from Varzin) and shook hands with him in the most marked manner and with great cordiality. This act, in such a presence, was taken to mean, "I owe this day and this monument to you." That same day there was sent from the palace to the Office of Foreign Affairs a casket containing the patent of Bismarck's princedom. The honor was long ago conferred, but the scroll is just completed. It consists of eighteen large sheets of parchment, elegantly bound together in book-form, and inscribed with illuminated letters of most exquisite form and coloring, representing flowers, landscapes, figures, and every variety of artistic and allegorical design. The text recites the services for which Bismarck is raised to the rank of a prince of Prussia, and the estates, titles, and privileges which this rank carries with it to him, his sons and successors; and it empowers him to add to his coat-of-arms a portion of the royal eagle of Prussia. The *Wir Wilhelm* with which the patent opens is in the king's own hand. The whole is tastefully encircled with silver cord and clasps, bearing the great royal seal. The patent was a matter of course consequent upon the ennobling; but in sending it the King inserted within the casket an envelope upon which he had written, "To Prince Bismarck, a diploma packet"—a pleasantry which showed his good-will. Quidnuncs of course must speculate about changes in the Prussian cabinet, but probably the King has a liking for the man who has made him an Emperor; and he is not likely to quarrel with a Chancellor who, though he asks to be relieved from the old routine of the Prussian ministry, spends his vacations at Varzin in arranging a meeting of the three emperors at Berlin in 1872, and now again a visit of the King of Italy in 1873, thus isolating all Central and Eastern Europe from France, and combining Italy, Austria, Russia, and Germany against the activity of the Jesuits.

—Mrs. Clara Mundt, better known as Louise Mühlbach, died in Berlin on Sunday last at the age of fifty-nine years. She began publishing novels so long ago as 1836, when she was twenty years old; and since that time she has published we do not know how many volumes—a great many, some of which are to be found in most houses in Germany, and translations of many of which are to be found in many houses in this country. Six or seven years ago her stories, translated into English, began to inundate our novel-reading public. The worst charges to be made against them are that historical facts, more or less incorrect, and rather feeble views of the course of history, make up the staple of them; that the style is worthy of the matter; and that one would have said that nobody could read them were it not that so many thousands of people did read them. Morally, they were not objectionable, except as is above implied; and so much of blame as is thus laid upon the authoress was a fault of the head only.

—The endeavors of Richard Wagner to found an opera-house in Bayreuth, Bavaria, for the performance of his own creations, have been seriously checked through the indifference of the public. A few years ago, the composer thought it easy to find a thousand musical enthusiasts, each of whom would be willing to contribute three hundred thalers towards the erection, outfit, and running expenses of his intended Wagnerian opera-house. He was much surprised at obtaining only a few wealthy subscribers, the public at large remaining thoroughly indifferent. This has induced him to publish a circular, in which he apprises his numerous friends how matters stand. He states, with commendable frankness, that even under the most propitious circumstances, the new theatre could not be opened before the summer of 1875. Although he has met with success in the acquisition of eminent singers, the technical outfit of the house is reported to be still in a very backward and rudimentary state. Indeed, but for Wagner's own exertions in arranging concerts in Berlin, Hamburg, and Cologne, not even the building itself would have been roofed and completed. On account of the imperfect state of the stage machinery, not even rehearsals can be held this year. Wagner intends calling a meeting of his patrons in October, to give them a full account of the state of affairs, and to solicit further voluntary contributions. If these should not be forthcoming, he will then resort to the last expedient of issuing stock for the continuance of the work. The failure of his countrymen to support him in what may fairly be called a national undertaking needs no explanation. Wagner is too sumptuous, profuse, and unnecessarily expensive in all that regards scenery and stage effect. His later

operatic creations require such immense outlay in costumes and machinery that only the heaviest subventions from the court could furnish the means for their adequate representation at the Court Theatre of the Bavarian capital. With the best financial management, with high-priced seats, and with all the galleries filled with spectators, such performances cannot pay, and bankruptcy must always be near at hand.

SYSTEMS OF CONSANGUINITY AND PRIMITIVE MARRIAGE.*

II.

WE pass now to the so-called Turanian family of Asia, which embraces, among others, the Tamil, the Telegu and other peoples inhabiting Hindustan, the Chinese, and the Japanese. In reference to the method of describing degrees of consanguinity, the Tamil may be taken as typical, as the classificatory system is more fully developed with them, with fewer modifications and exceptions than with any others. Their relationships, and the peculiar rules which control and define them, are identical with those which have been described as existing in perfection among the Seneca Iroquois. In respect to the various classes of kin, one is almost the literal transcript of the other, although, of course, the actual names given to these classes are unlike. We thus arrive at the fact that the same general system prevails in the Turanian family of nations and in the American Indian family; and that there is an absolute identity between the two peoples who were properly selected as types.

Turning finally to the Malayan family, to the inhabitants of the Australasian and other islands of the Pacific, we find very marked resemblances and very marked contrasts to the system which, as we have shown, extends over America and Asia. For purposes of illustration, we select here also a typical people—the Hawaiians—the partial exceptions and slight departures from the type existing among other nations of the family. The following are the pure Hawaiian relationships, referred as before to the *ego* as interlocutor. The brothers and sisters of my grandparents, on both father's and mother's side, as well as higher ancestors, and their brothers and sisters, are my grandparents. All descendants of my children are grandchildren. The children of my brothers and sisters are my children, and their descendants are my grandchildren. The brothers of my father and of my mother are my fathers, while the sisters of each are my mothers. The children of brothers, of sisters, and of brothers and sisters, are brothers and sisters to each other; their children are again brothers and sisters, and so on at each equal remove indefinitely. All the children of these my collateral brothers and sisters are my children, while their descendants are my grandchildren. Relationships by marriage follow the same rules. The distinctive features of this system are (1) its great simplicity; (2) the reduction of all relationships to five, grandfather and grandmother, father and mother, son and daughter, grandson and grand-daughter, brother and sister; (3) the contrast between it and the other phase of the classificatory system, in that no difference is made in the relationships by passing from the male to the female line, or from the female to the male. A primitive aboriginal custom of the Hawaiians (*punalua*, misprinted *pinalua* wherever named), first communicated to the world by Mr. Morgan, has undoubtedly an organic connection with their conception of relationships, and must be resorted to as the only explanation of the methods which appear to us so unnatural, and which would be not only unnatural but impossible among a people in which the marriage of single pairs was prevalent. Two or more brothers with their wives, or two or more sisters with their husbands, cohabited in common. One of the missionaries says: "This confusion of relationships is the result of the ancient custom among relatives of the living together of husbands and wives in common." Since the work was published, Mr. Morgan has received abundant information respecting the native inhabitants of Australia, which brings them into a close and almost identical relation with those of the Hawaiian islands, and even demonstrates the existence of the peculiar custom of communal wives and husbands.

Such are the facts established beyond dispute; what conclusions do they render probable or certain? It is found that the same remarkable system exists among peoples widely separated in everything which characterizes community of race. This identity cannot be accidental. If it does not rest upon a unity of race—which is more than doubtful, because so many of the other elements which would go to establish this ethnic unity are wanting in many instances—it must rest upon the more general fact that certain social institutions are necessarily involved in certain primitive conditions of mankind. These institutions, which are exceedingly permanent, when ascertained, point unmistakably to the prior existence of those conditions in the particular people; and, as a consequence, all peoples which now possess traces of the institutions must some time have passed through the given conditions. This is the scientific value of a comparative study of social institutions.

In regard to the descriptive system of consanguinity, we simply say that it is the natural and necessary result of marriage between single pairs, and plainly follows from the certain lines of descent, lineal and collateral, which must flow from such marriage. There is reason to believe, as will appear, that the system itself, and the single marriage and certain family which it assumes, were later in time than the others and the communal union or tribal organization which they presuppose.

The classificatory system, if it grew up when proper marriage between pairs prevailed, would be arbitrary, without reason or cause, contradictory, and even impossible. It should be carefully borne in mind that we are only seeking after its origin; that is, the social status which gave it birth. That state may long ago have disappeared. Undoubtedly, the tribal organization, and the customs of polygamy and polyandria, had an influence upon the classificatory system, and account for and were perhaps the modifying causes of some of its features; but it could be shown in detail, if space permitted, that they fail to account for all these features upon any natural or even possible sequence of cause and effect. The following explanation, partly conjectural, is given by Mr. Morgan:

The Malayan type, being the simpler, is plainly the older, while the Turanian and American Indian was developed from it by the addition of a new and antagonistic element. Assuming the Hawaiian custom—that is, that several brothers and their wives, or several sisters and their husbands, cohabited together as a separate association—the Malayan form is explicable; even to its minutest details, it flows as a natural consequence from the relations to each other of the males and females. But this Hawaiian custom seems to assume two antecedent stages, out of which it was in fact a reformatory movement, namely, cohabitation of brothers and sisters, and even promiscuous intercourse. It may be regarded as a compact between several brothers, or the husbands of several sisters, to defend their common wives against the violence of outsiders. Mr. Morgan takes up in detail the list of Malayan relationships, and shows by an exhaustive course of deduction how each flows as a natural or necessary result from the prevalence of the so-called Hawaiian custom in a given condition of society. This analysis is, however, intended rather for the scientific than the general reader.

Assuming a primitive state in which this social institution was universal, the introduction of the tribal organization upon it would account for the Turanian and American Indian phase, and would be another grand reformatory movement away from savagery. Mr. Morgan here also applies his acute analysis with the most satisfactory results. The new elements which have entered are the prohibition of marriage between members of the same tribe, and the perpetuation of the tribe either through the female or the male line of descent alone. Engrafting these additional features upon the prior customs, the half of the Turanian and American Indian relationships which are different from the Malayan instantly appear.

We are now prepared to draw a conjectural but highly probable picture of the primitive condition of mankind in respect to the family relation, and of the successive great reformatory movements by and through which society was lifted from the lowest depths of savagery, and borne along a course of progress until it reached the conception of that family which now forms the unit of social organization. The following is the series: I. Absolutely promiscuous intercourse, or a depth of savagery akin to the beasts. This is, however, entirely conjectural, and an *a priori* assumption from the two following stages. II. Cohabitation between brothers and sisters, and a segregation of certain males and females, with their children, which may be termed the communal family. This would exist simultaneously with the former, and would be the first and natural attempt of individuals to follow the social impulses of our nature. If it should be objected that the very relationships of brother and sister imply the family as we understand it, or at least the patriarchal polygamous family, and that the assumed prior custom of promiscuity negatives the possibility of brothers and sisters—that is, of knowing and recognizing any persons as brothers or sisters—the answer is very plain. Undoubtedly, it would be impossible to know and recognize *full* brothers or sisters in our acceptation of the term—that is, as children of the same two parents; but from the nature of the case, uterine brothers and sisters would always be known, and, therefore, even in the primitive conjectural bestial state, these classes of persons would necessarily exist. III. The Hawaiian custom. This was an improvement upon the pure communal family; it was, or might have been, a partial abandonment of cohabitation between brothers and sisters, and therefore a real reform. During the prevalence of this custom, the actual relationships of consanguinity that have been termed Malayan would be a necessary result, and they have been handed down, although the custom itself has disappeared, except among a few savage peoples. IV. The tribal organization. It is demonstrated that

* 'Systems of Consanguinity and Affinity of the Human Family. By Lewis H. Morgan, LL.D.' Smithsonian Contributions to Knowledge, No. 218.

this institution was universal in certain periods of human progress. Plain traces of it are seen among the Romans and the Greeks, and many difficulties in respect to their primitive institutions, political, social, and legal, will be explained by a more complete and accurate knowledge of the Tribe. It was perhaps the greatest voluntary effort of humanity to raise itself towards civilization. It broke up for ever the cohabitation between brothers and sisters, and although it was not inconsistent with polygamy, or even polyandria, it made the segregation of parental pairs possible. During this period, the relationships now found among the Turanian and American-Indian families would be actual and necessary. Thus far there was no conception of the individual family, of property owned by the parents, of regular lines of descent, and of inheritance in those lines. The tribe was the unit; tribal members were consanguinei through their common membership—they were born into the tribe; and what few things had come to be regarded as the subject of property belonged to the tribe—inheritance by it being the only inheritance. Modern research has left no doubt that the original notion of property was as a communal right, and that individual ownership was a subsequent and in fact recent outgrowth from this primitive root. The so-called philosophical speculations into the origin of property, an example of which may be found in Blackstone, have been corrected by historical analysis. But in the progress of time, and by the physical improvement of mankind, the notion of individual property sprang up, grew, and finally became dominant over that of the communal or tribal. With it was awakened the desire to perpetuate this ownership, to transmit it through one's own representatives. Such an act was impossible, unless propagation was confined to distinct parents, so that the children might be known, and the ancestral owner might be assured that his possessions would follow a certain line of a progeny ever perpetuating his blood, and, as it were, continuing his personality. As soon as this notion became sufficiently strong, there was of necessity a social revolution; and, V. Polygamy and the patriarchal family were the result although side by side with them there doubtless sprang up some monogamous unions. Polygamy, as a social institution, representing the condition then reached by the human race, was an immense step in advance. As found in the patriarchal family, it was compatible with a high culture, and with a lofty conception of nature, morality, and God. But still, under it property was regarded as an attribute of the family rather than of the individual, although for the time being entrusted to the control of the head in whom the family rights and functions were all centred, and by whom the family was represented. This conception is plainly set forth in the early Hebrew history and poetry, and it also lay at the basis of the primitive doctrines of the Roman law touching the power of the *pater familias*. VI. The present marriage of single pairs and the modern family. When the notion of individual instead of representative or family property became more clearly defined, the final step was inevitable, and polygamy, with its patriarchal concomitants, gave place to the permanent marriage of single pairs, and the family of two parents and the offspring under their tutelage—the unit of modern civilization. We need not dwell here. The analysis thus given, and it has been rigorously scientific, has demonstrated that our institution of marriage, which appears to us so normal, so essentially a part of humanity, is a thing of recent growth, and found its occasion and partial origin in the conception of individual property with its rights and duties. A recent growth, we say comparatively, for the immense tracts of time through which the human race was slowly raising itself from its aboriginal savagery to the epoch even of patriarchal polygamy, cannot be estimated.

We have thus, in our own manner, given an accurate though very general outline of Dr. Morgan's remarkable work. With one suggestion we close. As this publication of the Smithsonian Institution can be reached only by a few experts, and as it is not intended for general use, if the author would leave out the tables and recast the chapters, omitting the minute and technical details, and giving in their place the conclusions which they sustain, he would make an exceedingly interesting, readable, and popular book. The results of scientific enquiry are now eagerly sought after, especially if they appear to be a little heterodox.

A POETICAL DICTIONARY.*

THIS volume is one of two volumes of quotations, which, as Mr. Allibone designs, shall supplement his well-known 'Dictionary of Authors.' Shortly after he had projected the 'Dictionary,' he resolved that it should be followed by a copious selection of quotations from the principal authors recorded in that register, and in pursuance of his resolve he gives us here a large bookful of poetical passages. The volume of prose quotations is to succeed this one; and when that shall have appeared, the original design will be fully completed.

The plan of the volume before us—which contains more than 700 well indexed pages—is as follows: Having settled upon a certain number of large topics—"Love," for instance; "Friendship," "Beauty," "Death," "Sin," "Silence," "Woman," "Fear," and four hundred others—as being worthy of illustration by poetical passages, or as affording convenient heads under which to arrange important utterances of the poets, Mr. Allibone proceeds to place these topics in alphabetical order throughout his book. Thus, "Absence" heads the list, "Adversity" follows, and then come one after the other, "Advice," "Affection," "Affliction," "Age," "Agony," "Agriculture"; the last topic of all, the one which closes the book, being "Zeal," which is preceded by "Youth," "Wrong," "Worth," "World," and so on backwards to "Absence" again. The headings being thus chosen and arranged, Mr. Allibone under each one sets down numerous poetical passages, which he places in an order depending on the place in the alphabet of the author's name. Accordingly, of the poets chosen to illustrate the topic of "Zeal," Dr. George W. Bethune leads off, his name beginning with B, and is followed by Cowper, Darwin (Erasmus), Denham, Dryden, Fiamma (Gabriele), Goldsmith, *Household Words* ("Sowing and Reaping"), *Household Words* ("Springs in the Desert"), Macaulay, Milton, Moore (Thomas), Newton (John), Procter (Adelaide), Raleigh, Shakespeare (cited once), Thomson (Mrs. Archibald, cited twice), Thomson (James), Wesley (Rev. Samuel), Whittier, Wilcox (Carlos), and, finally, Wordsworth.

We have been at pains to copy out this roll of authors not to emphasize the point, clear enough before, that Mr. Allibone is fond of his convenient alphabetical method, but because the list may have its use in making clear a point of more importance. And that is, that Mr. Allibone has been so far from falling into the error of being so nice in his selection of passages as to be difficult and over-fastidious, that, in our judgment, he has fallen a long way short of being duly discriminating. On what principle of selection, unless on the principle that a manual of poetry for purposes of reference ought to contain every word of verse that ever anywhere got into print, could Dr. George B. Bethune's four long stanzas on "Zeal" be selected for a place in the manual before us? We do not see. One of the stanzas is as follows, and we may remark in passing that about Zeal neither this nor the other three stanzas can be said, speaking strictly, to have any thing at all to say. At least they have quite as much to do with half a dozen other sentiments as they have to do with zeal, and thus they are out of place. Of the four we may as well quote any one as any other. We quote the first. "Live to do Good" is the title of the piece:

> "Live to do good; but not with thought to win
> From man return of any kindness done;
> Remember Him who died on cross for sin,
> The merciful, the meek, rejected one;
> When He was slain for crime of doing good,
> Canst thou expect return of gratitude?"

It will be seen that these lines, if they have little to do with zeal, have as much of zeal as they have of poetical merit, and, assuredly, have far too little of that to justify their admission into a collection which, however expansive and wide-embracing may be the plan of its construction, is at all events avowedly a book of *poetical* quotations.

One of the topics to which Mr. Allibone calls attention in his preface as being treated of with copiousness and thoroughness is the topic of "Birds." That subject he has illustrated, he remarks, by citing 260 passages from no less than 45 authors, and the "Birds" may serve, we suppose, as an example of the way in which the compiler's task has been accomplished. Industry certainly has been brought to its accomplishment; and so has a hand practised in compilation and arrangement. As a result, we have a volume containing a vast number of short excerpts from the English poets; and it is a volume very easy of consultation; both for what it contains, and for the accessibility of its contents, it will be found by many persons a useful book. But over its preparation there has presided, it would seem, a taste uninstructed in poetry—unless indeed we ought to say an inherently defective taste. For instance, the reader will find in Mr. Allibone's "Birds" a "widowed turtle" of Sir Samuel Garth's:

> "The widowed turtle hangs her moulting wings,
> And to the woods in mournful murmur sings";

and he will find also some "feathered warblers" of Tickell's:

> ". . . . Hark, on every bough
> In lulling strains the feathered warblers woo";

and there are "a thousand birds" out of Spenser:

> ". . . . Leaves of flowers
> That freshly budded, and new blossoms did bear,
> In which a thousand birds had built their bowers";

and a great many fowl equally vague, wild, or villatic, out of Dryden and Pope and Prior, who, we may remark here, are especial favorites with Mr. Allibone. Dryden, for example, he quotes far more often than he quotes

*'Poetical Quotations from Chaucer to Tennyson. With Copious Indexes. Authors, 550; Subjects, 425; Quotations, 13,600. By S. Austin Allibone.' Philadelphia: J. B. Lippincott & Co. 1873.

Milton; Pope is quoted but a trifle less often than Shakespeare, each appearing more than 300 times; and Prior occupies more space than Cowper, Burns, Scott, Coleridge, and Wordsworth put together. Indeed, for that matter, Burns, Coleridge, and Wordsworth all three together hardly outcount Sir Richard Blackmore himself. This certainly is being very conservative in one's poetical taste. Sir Richard does not, however, appear in the "Birds," and no more do a great many other people who have a better right—a right so much better that were we to be asked why they had been excluded we should be unwilling to attempt an answer. Among these is Chaucer. For anything here visible, Mr. Allibone may never in all his life have heard that

> "The smale fowles maken melodiē
> That sleepen al the night with open yhe";

nor, unless we turned to the passage cited from Dryden's recast of the 'Nun's Priest's Tale,' should we know whether Mr. Allibone had ever heard of Chaunteclere—

> ". . . . . A cok hight chaunteclere;
> In al the lond of crowyng was noon his peer.
>
> His comb was redder than the fine coral,
> And batayld, as it were a castel wall.
> His bile was blak, and as the geet it schon;
> Lik asur were his legges and his ton;
> His nayles whitter than the lily flour,
> And lik the burnischt gold was his colour."

In fact, Chaucer throughout fares very badly at Mr. Allibone's hands, and as this will appear a matter of some consequence if we consider who Chaucer is, and if we consider further that Dr. Allibone is regarded by many as something of an authority in our American literature, we may be excused for digressing a moment to enquire how this matter is managed. Of the wisdom of Dr. Young, of the 'Night Thoughts,' Mr. Allibone gives us a portion more than a hundred times; more than half a hundred times apiece he quotes Nicholas Rowe and Lord Roscommon; Tickell is cited thirty times, Parnell fifteen, and Chaucer—like Mrs. Ann Radcliffe, Mrs. Tighe, and Mr. William Mason—seven times. And this seven times much infelicity attends. On the first occasion we get these two lines, and the man must "bear a brain" indeed who should tell how any use could be made of them—unless Mr. Swiveller, with his unrivalled power of quotation, were to rise from the dead. They are to be found under the heading "Agriculture":

> "Asked if in husbandry he aught did know
> To plough, to plant, to reap, to sow."

On the second occasion of the poet's appearance, he is brought in to illustrate the subject of "Forests," and it is in this Chaucerian manner that he does it:

> "There would be seen a farmer that would sell
> Bargains of wood which he did lately fell."

Chaucerian, indeed; but it would seem that Mr. Allibone has carelessly allowed himself now to assign a modernized bit of the poetry to its renovator, now to leave the title to the renovated article with the original owner—an arrangement by which Chaucer is equally injured, whether his goods are kept in his name or transferred to that of another. So far as we can see, Dr. Allibone has, in each of these instances, copied the passage, not for any merit that it had; nor because of any likelihood that anybody would ever care to see it, or would ever by any possibility make use of it; but purely because the lines had in them the words "reap," "wood," "farmer," "husbandry," "plough," and "sow." Certain it is that, whatever his reasons, the passages are, as illustrations, absurd. At the third of Chaucer's appearances he comes again in a couplet, "Lawyers" being the subject:

> "Now like a lawyer, when he land would get,
> Or sell fee-simples in his master's name."

The fourth extract is concerning "Shepherds," and, like the others, is Chaucer improved:

> "Giving an account of the annual increase
> Both of their lambs and of their woolly fleece."

On the other three occasions on which the poet is called in, he is treated somewhat more worthily; his own language is used, and the quotations are to some small extent characteristic. But to take eight lines out of the description of the Wife of Bath, and set them down as illustrative of the subject of "Wives"—women, that is to say, in the relation of wedlock—we suspect to be the result of a blunder—a blunder like that of making a description of Young Launcelot Gobbo answer for a description of the *genus homo* because Launcelot was Shylock's "man." The Wife of Bath had been a wife in the sense in which Mr. Allibone uses the word in his heading; but it was not in that sense that she was so designated by her fellow-pilgrims.

But if Mr. Allibone uses Chaucer much as Donna Julia used the General Count O'Reilly, there are others whom he uses very little better, and perhaps worse. Mr. Robert Browning, for example, is not once mentioned; and, of course, that this is injustice, or else something that deserves a term less harsh, but perhaps more unwelcome, it does not require a devotee of Browning to perceive. This, surely, is a bad showing for a large and pretentious collection of poetry, made under a responsibility in presence of which prejudice, however justifiable, should be disregarded. So, too, of Landor, who goes entirely unmentioned, while swarms of the Landons, Eliza Cooks, Streets, and Sargents infest the book.

Going back to the "Birds," we may say that as for the thoroughness and success with which our compiler has prepared this department, we shall leave the subject with a reference to the quotations already made above, and with the remark that we look in vain in Dr. Allibone's list for Wordsworth's cuckoo or his skylark; for Shelley's skylark, or for Hogg's; for the robin-redbreast of the 'Babes in the Wood,' or that of Webster's dirge; for Barnfield's nightingale; for the swans of the 'Prothalamion'; for Tennyson's dying swan; or for the too-much-forgotten dying swan of Giles Fletcher—

> "So down the silver streams of Eridan,
> On either side banked with a lily wall,
> Whiter than both rides the triumphant swan";

for Tennyson's blackbird; for Bryant's waterfowl, or the same poet's Robert of Lincoln; for Emerson's chickadee, or for a score or a hundred others, all well known and well deserving to be better known than all Garth's turtles or Tickell's feathered warblers. A similar examination of other departments as well as this of the "Birds" shows similar defectiveness.

Beyond question, however, the manual is one worth having, and is a monument of industry, busy to be sure rather than laborious, which deserves recognition and respect. But a good manual of this kind is still wanting. Whoever undertakes it will do well to recollect that the endeavor to make his book a huge concordance, in which shall be found marked down every passage in every poet in which such and such a word has ever been used, will be an endeavor sure to result in failure, and one of which, even could it succeed, the result would be without practical value. Far too much of this has, we think, been done by Mr. Allibone. To select well the topics to be illustrated, and then to select such illustrative passages, all truly illustrative, as shall of themselves afford no unpleasant employment to the poetical reader—these would seem to be the main things to be borne in mind by such a compiler. He will have no slight labor before him when he addresses himself to the attempt. And perhaps, for those who use books of this sort, two or three poor ones are as good as would be a single one done really well.

THE MAGAZINES FOR OCTOBER.

IN the *Popular Science Monthly* Mr. John Fiske devotes a dozen pages to an examination of Mr. Agassiz's relations to Darwinism. Mr. Fiske read in an advertisement of a "Lecture Extra," published by one of our widely circulated newspapers, the announcement that follows: "The Darwinian Theory utterly demolished" [or words to that effect] "by AGASSIZ HIMSELF." Upon reading this, Mr. Fiske laid down his paper, he says, and asked himself, "Can it be that we have after all a sort of scientific pope among us? Has it come to this, that the services of some one 'servant and interpreter of nature,' are to be accepted as final even against the better judgment of a majority of his compeers?" The admission has to be made, and Mr. Fiske's article proceeds in the first place to combat it; afterwards to show that Mr. Agassiz has never yet given evidence that he understands what the Darwinian theory is; and, finally, to point out to him five questions which, when he does seriously attempt to refute that theory, he will have to consider and answer as he has not heretofore answered them, or so much as considered them.

The most noticeable magazine article of the month is Mr. Welles's discussion, in the *Galaxy*, of Mr. Adams's speech in eulogy of Mr. Seward. It gives in somewhat general terms Mr. Welles's opinion of the relative mental and moral gifts of Mr. Lincoln and Mr. Seward, and confirms, though without much definiteness of evidence, the popular belief that Mr. Lincoln was the abler man of the two, and that Mr. Seward's training and accomplishments were not such as to overbear the President's native strength of will and judgment. Mr. Welles thinks it a flagrant violation of the duty of history, so far as it is the duty of history to apportion honors justly, to make the assumption that "Mr. Seward directed the affairs of the nation through Mr. Lincoln." "I am not aware," says Mr. Welles, that in the affairs of the Treasury Department, for instance, Mr. Seward ever proposed a measure or so much as made a suggestion. Again, as regards the War Department, there was, says Mr. Welles, an intimacy between Mr. Seward and that Department; but Mr. Welles "does not remember" that Mr. Seward proposed or directed the conduct of a single campaign, or originated any movements save some irregular, unfortunate proceedings in the early days of the new Administration, "when he took upon himself to perform secretly and improperly the duties of Secretary of War without the knowledge of that

officer." So, too, of the Navy Department: "In the administration and operations of the Navy Department he had no part," although at first he attempted, "in total disregard of good government and correct administration, to intermeddle with naval matters," and thus brought down on himself disapproval. With the management of the other three departments of the Government exclusive of his own, Mr. Seward had as much to do, Mr. Welles asserts, and only as much, as he had to do with the management of the Departments of War, Navy, and Treasury. When the Cabinet was consulted, Mr. Seward was consulted as his colleagues were, and his advice, like that of the other Secretaries, was weighed by Mr. Lincoln, who accepted it or rejected it as to him seemed good. And in the business of Mr. Seward's own department, the Secretary was not supreme; the President, there as elsewhere, directed the Governmental policy, and sometimes overruled, modified, and improved the Secretary's despatches. As we have said, all this is in the nature of assertion and opinion; but it comes from a man who was in a position to observe certain facts correctly and to form second opinions. A difficulty in coming to such a conclusion as shall reconcile the opposing views of judges like Mr. Welles and Mr. Adams, is that the issue between them seems to be not very plainly drawn, and that a good deal of what is said by each may be only apparently and not really contradictory. However that may be, there are parts of Mr. Welles's article which, it appears beyond a doubt, should be accepted; and of these parts one or two will lead, we suppose, to a modification of some of Mr. Adams's statements. For example, Mr. Welles gives us, from Mr. Lincoln's own mouth, the story of the formation of Mr. Lincoln's first Cabinet, and not only the time when the President elect began meditating on this subject, but the character of his meditations and his dealings with the Weed clique—which offered him, ready made out, a cabinet scheme which he at once rejected—all these seem to show that Mr. Lincoln, in "his secluded home in the heart of Illinois," was by no means so blind to the crisis before him, and by no means so destitute of well-digested plans, as Mr. Adams has seemed to suppose. And pursuing this general subject, Mr. Welles makes a telling comparison between Mr. Lincoln's conduct during that dreary winter of 1860–61 and the conduct of the distinguished Seward, the leader of his party, to whom everybody was looking for leadership, and from whom little more was got than prophecies, doubtless sincere, of peace and quietness again in ninety days. This essay contains a slight outline sketch of Mr. Thurlow Weed and the Albany lobby which is the reverse of complimentary, but which may be read with some satisfaction. When, however, one reads of the machinations of the Weed wire-pullers in the Chicago Convention, one is forced to recollect the Anti-Weed New Yorkers who were on the ground, the "original Lincoln rails" that were carried into the hall of the Convention by a humble companion of Lincoln's early years, the transfer of the votes of the Pennsylvania delegates, and some other tricks and devices cleverly managed by some Western and Northwestern saints, and not managed in the interest of Mr. Seward either.

Another noticeable article in the October *Galaxy* is one called "Punishing a Pundit." The sanguinary tendency of the study of the lesser philology has seldom been more warningly shown than in this encounter from first to last. Dr. Fitzedward Hall, who is the pundit here punished, began the conflict by a little book on the alleged false philology of "Words and their Uses." In this work he was vivacious enough to call Mr. Ruskin an inspired idiot, and to speak of several other eminent writers in terms which, we may say, were more strictly applicable to that particular aspect of them then under Dr. Hall's consideration than to these eminent writers considered each in his totality—as a man, *totus teres*, etc., as a husband, a father, an author in prose and verse. But this is nothing uncommon in the history of verbal criticism, which always arouses all the most desolating passions; and Dr. Hall's book, while it contains a great deal of good sense and useful information, which we commend to our readers' attention as less sciolistic and more to be depended upon than the teachings of nine in ten of such books, is not so much more aggressive than its fellows. Be that as it may, its author now has it meted to him according to his own measure—or rather, according to Scripture measure—full, pressed down, and running over. Thus, Dr. Hall is "a Master of Arts, a Doctor, an Honorary Doctor of Both Laws, and formerly Professor of the Sanskrit Language and Literature and of English Jurisprudence"; a doctor who "pours out his gall at his own expense"; "a moral pachyderm"; "a man born without the sense of decency"; a man "in whose nature self-conceit takes the place of self-knowledge"; "the yahoo of literature"; a "former Vermont Yankee, now British resident, Doctor of Both Laws, and Pundit by brevet"; a writer of "affected nonsense"; one whose works, were "they burst bladder-wise, or reduced to their gaseous elements," would explode with such violence as would endanger "the stability of all English-speaking peoples"; a writer who, "whatever his other attainments, falls short of originality in sin"; one who "lingers lovingly over such a noun as *agential*, rolling the loathsome morsel under his tongue"—the wretch; a writer whose chief trait is "a combination of deficiency of knowledge with incapacity of apprehension on the points as to which he makes most pretence and most parade"; a writer than whom "did ever a man write more like a shopman?" a writer who "can never resist the temptation to a wanton personal slur or insult"; a writer in whose books a union of "common sense, plain English, and politeness would be strange, perhaps unaccountable"; a writer who is a liar (this in Latin); a writer of whom it is asked, "Will it be believed that a man who has had the training of a scholar and the position of a gentleman could be so small as that?" a man whose "English is bad, his manners worse, and his moral tone worst of all"; a literary pharisee and a piddling pedant; a man who, according to the judgment of one of his adopted countrymen, is "an ass" and "a spluttering idiot," and, according to the judgment of another, must be "rather caddish" if one of his assertions is to be taken as revealing his degree of gentlemanliness; "a most learned pundit" who is not "an inspired idiot," as Ruskin has been called, but "an idiot without the inspiration"; "a Yankee cooked up British fashion"; a rival of Antinous so far as regards "arrogance and petulant vituperation"; a "shuddering purist"; "a hapless Doctor of Laws," and a dozen other things.

This is the style of controversy which is known as that in which the hat, coat, and cravat are taken off, and is easily imitable. There was the less need of it on this occasion, because the essayist appears to have a case against his antagonist—as, indeed, happens in this kind of warfare, in which one chooses always the weak spots in the enemy's line. And weak spots there always will be, if we may judge of the future by the past, for never yet was there a good writer whose English a verbal critic could not, with one hand tied behind his back, show to be of a character to make a small boy blush, such ignorance does it reveal, and to call down the lightnings of heaven, such is the baseness of the writer's morals and manners.

Of other *Galaxy* articles, one is a story entitled "An Apple of the Dead Sea," and another is some gossiping, but not wholly gossiping, talk about the former days of the stage, which, always, in all ages, it is the custom to say were better than these, but against which Mr. H. W. Frost urges some objections. As for the "Apple of the Dead Sea," the story is curiously coincident with one by Mr. Thomas Aldrich which appears in the October *Atlantic*. Both writers have for their hero a gentleman who has fallen heavily in love with a circus acrobat, to whom he gives presents, and who by-and-by turns out to be an illiterate boy. Apparently the story has for a basis the allegation current a few months ago that a well-known acrobat attached to one of our theatres was a man disguised in woman's clothes. The *Galaxy* writer expends more strength than the writer in the *Atlantic*, and draws for his hero a silent, sapless Russian—a creature something like the father of Björnson's Fisher Maiden, but duller—who has all his life lived in ignorance of anything beyond the counting-house of his tyrannical uncle. The *Atlantic's* hero is more commonplace, and the story throughout is slighter and more trivial, if that is necessary. A sort of factitious interest is given it, we observe, by means of a device which it is easy to employ too much, although there is a class of readers who prefer it to true skilfulness in securing attention to a story. Another Bostonian writer of short stories has used it a good deal, and with profit; for evidently a story which has in it Scollay's Building, and lines of real horse-cars, and T. Wharf, and the Hingham packet, may safely be a poorer story than another which has them not, but depends for its interest on the weightier matters of story-telling law.

Besides "Mademoiselle Olympe Zabriski," the *Atlantic* has more of Mr. Robert Dale Owen's reminiscences and of Mr. Parton's Jefferson, and an article in which General F. A. Walker predicts that we shall not number a hundred millions in 1900, as in old times we used to say we would, but that we may probably number not far from 75,000,000.

A readable article in *Scribner's* is a little collection of Turkish proverbs made by a writer who appears to know more about Turkish proverbs than about the English bibliography of proverbs. Collections of this sort of literature are not so unknown as he appears to suppose. His specimens include thirty-four proverbial sayings common, as he says, to English and Turkish, and a hundred and thirty-two styled "miscellaneous Turkish proverbs," of which, however, some are found in English too, and in other tongues as well: "The eye of the master is the horse's grooming"; "He that gives quickly gives double"; "There is a remedy for all things but the appointed time to die" (the last five words one word in Turkish); "Do not awaken the sleeping lion"; "That man is to be feared who fears not God," and so forth. Others are new, we believe: "The kick of the camel is soft, but it stuns"; "A weapon is an enemy, even to its owner"; "If the judge is your accuser, may God be your help"; "The female bird builds the nest."

"The Old Van Rensselaer Mansion" is an illustrated article on a good

subject; "Sieur George" is by a writer new to us, and of some promise; "Free Marriage," by Miss L. G. Noble, has for a merit that it presents sound practical views, and presents them with a degree of plain speaking which is not usual. "The whole question, be it distinctly stated," says Miss Noble, "is one not of *un*marrying, but of *re*marrying: this is the vital thing for which the reformers clamor; and just here is the point where their dispute with the rest of the world begins." Everybody knows this to be true; though, to be sure, it would not be true to say that a clear-headed determination to go with open eyes to the gratification of their affections and appetites is the moving power which impels all the so-called reformers of marriage. Something not much worse than the demand for sympathy is in a certain number of cases, perhaps in a majority of cases, combined with a weak-headedness and an inability to see whither their half-formed, half-held theories tend. They are partly people who would invade other beds; but perhaps more often they are weak people who, having made their own beds, cannot lie in them, and who, furthermore, cannot see the relations of the bed and the cradle to the rest of the social fabric.

Mr. Bret Harte finishes, in this number, his "Episode of Fiddletown," the thread of which we have found a rather tangled skein; but the boarding-school girls of this last scene are takingly sketched. A lively writer, with opinions of her own, treats of Central Park; Mr. Augustus Blauvelt concludes his papers on "Modern Scepticism"; "Arthur Bonnicastle" reaches its end; and there is the regular amount of poetry, Topics of the Time, and the like.

In *Lippincott's*, Mr. Black's "Princess of Thule" has reached a crisis, Sheila having left her husband's house for a reason which, we fear, too nearly puts him in the right, and bids fair to prepare long trouble for our heroine; "The King of Bavaria" is sketched by a well-wishing Protestant friend; "Unsaid" is a more than usually good poem; "A Strange Land and a Peculiar People" treats slightly of the loyalist and rebel mountaineers of Kentucky; and there are several illustrated articles.

Fowl-fanciers and egg-raisers will be glad to have their attention directed by *Harper's* to M. Eugène Fayot's "Poules et Œufs"—a book which furnishes the text for an article on the hen houses of the Baroness de Linas, of which a pleasant account is given. The baroness, after a long experience, appears to have mainly discarded all fancy breeds, and to have adopted the common fowl of the country as her favorites; but they are so housed, fed, and otherwise cared for that they must in effect be very uncommon fowls. Another set of *Harper's* readers will be pleased with the paper on "A Tobacco Factory," while Northern philanthropists may, we should think, be gratified at the report made by another contributor, a lady, of the condition of General Armstrong's normal school for negroes at Hampton, Virginia. There is also "The Judicial Record of Chief-Justice Chase," by a member of the bar of the Supreme Court; a description of Mauritius, the home of Paul and Virginia; and some account of a reprobate Italian tramp, who, finding a romantic little girl sitting by herself reading 'Thaddeus of Warsaw,' took up the volume, and, discovering what it was, monstrously declared to her that he himself was "dat Taddeus," though now out of money, and who thus secured her two-dollar-and-a-half gold piece.

Church and State in the United States. By Jos. P. Thompson. (Boston: J. R. Osgood & Co. 1873.)—Dr. Thompson, while residing in Germany, finds that country agitated by the question of the relation between church and state. Through a private conversation with certain German gentlemen, he is led to put in writing and submit to Prince Bismarck a statement of the solution of this problem which has been adopted in the United States. His treatise having been translated into German to serve its original purpose, is now published here in the original version. This publication can hardly have any other motive than to submit to the approval of his countrymen the account which he has given of one of their social arrangements. As far as it goes, the account is correct. Indeed, the statement of our theory of the relation between church and state is a very simple matter. It is a simple negation of any relation at all, and we have applied that theory positively to separate them in every respect. We regard every contact and relationship between them with suspicion, and we go so far (at least this is the popular feeling, which is re-echoed in the press) as to view with suspicion any citation of religious principle or motive or sanction in political affairs. Even this does not exhaust the present tendency in this matter. While we have certain religious circles who believe in the persons who are technically called "Christian statesmen," we have another large class who meet the application of even moral principle to politics with contempt. This latter class is growing. The downfall of some of the eminent Christian statesmen has strengthened this party and increased their number, for the popular mind is not careful to reflect that the downfall of the Christian statesmen proves no more against Christianity than against statesmanship.

Such being the status and tendency of feeling amongst us in regard to the relation of church and state, and a large part of the best thinkers of the country being profoundly convinced that what is needed above all else in our politics is moral principle and moral stamina, whether based on religious sanctions or not, it would appear that our experience is not so clear and positive a proof of our theory that we can go before the world with it as a final solution of this difficult problem. Hesitation is suggested also by another consideration. It appears from our experience that the more we popularize government, the more impossible it is to keep any public interest "out of politics." It is very certain that our religious faiths, of whatsoever form or grade, have very little effect at the present moment on our public life. Has the separation of church and state led to this—that our moral principle and conscience are all in the church, and our practical life all in the state; and have they thus become permanently sundered? Still further, have they separated the population into two groups—the honest, conscientious, and religious on the one side, and the intriguing, unscrupulous, and political on the other? The actual severance of the sober, conservative, and reflective part of our population from practical politics is an undisputed fact. It has as yet given rise to no misgivings in the popular mind as to the finality of our solution of the church-and-state problem, but if the proposition be true which is already beginning to attract the faith of the best political thinkers, that *no* public interest (taking public interest in the widest sense) can be severed from politics under our system of popular government, then even the separation of church and state may turn out to be only a happy compromise, a great advance at the time it was made, but not a finality. It has been a great success in our history on the whole, but we find that its ultimate applications involve great difficulties. We have succeeded in putting the moral influence of the church at a distance from politics, but the political power of the church which can control a consolidated voting power is a notorious fact. In view of this, there is room to pause and hesitate before we offer our theory to the world as conclusive and final.

Dr. Thompson does not feel any such hesitation. He enters upon his task with a double enthusiasm: first, a patriotic enthusiasm in that he is able to bring from his fatherland a complete and final solution of a vexed question, and, secondly, an enthusiasm in that he is able to favor his hosts with a solution of their difficulty. His presentation of the subject is popular, and seems to bear still the character of the conversation out of which it arose. Looking at it from the standpoint of those for whom it was intended, we may believe that they will find it unsatisfactory for lack of that exhaustive analysis and command of the subject to which they are accustomed. It is written as if to influence popular opinion through the columns of a newspaper, not like a report or memorial prepared for submission to statesmen and sociologists. They will miss in it especially that presentation of the practical effects of an institution on the various classes and interests of society which it is most important to know in order to judge of the value of a social institution. They will miss also any reference to the peculiarities of American society which have made the separation of church and state in America a possibility and a success; and when, therefore, they come to consider the advisability of transferring the foreign institution to their own soil, and desire to weigh the social differences, which must have great influence on their decision, they will lack the data for one-half of the comparison. It is probable also that they will discern marks of a disposition to smooth over and apologize for certain facts which cannot be denied, and which need to be conceded more frankly in order to give a thoroughly fair statement of our experience. The task of setting forth the social circumstances, popular faiths and feelings, accepted traditions, etc., which form the atmosphere of institutions, is no easy one, but it is essential to be done when we recommend to one nation the institutions of another. The existing social arrangements of Germany are the great obstacle which prevents German statesmen from cutting the question by simply separating church and state, as so many seem to think they ought to do. It may indeed be doubted whether, if we had to meet the question, with our society so far solidified as it now is, and with a number of churches accustomed to state subsidies, we could decide it in this way ourselves.

Politics and Mysteries of Life Insurance. By Elizur Wright. (Boston: Lee & Shepard. 1873.)—For twenty years past, the author of this book has been familiar to the public as a writer on the science of life insurance, both in his capacity as actuary to some of the companies, and as the distinguished Insurance Commissioner of Massachusetts for several years. The volume before us by no means adds to Mr. Wright's well-earned fame. The newspapers for months past have brought the subject of life insurance into unusual prominence, and the recent amalgamations and failures of companies have made policy-holders more eager than ever before for enlightenment upon the condition and management of the business. To a public hungry for infor

mation upon a subject affecting the interests of thousands of families, Mr. Wright throws a sandwich of very thick slices of bread (which he had had in the house for a long time), very thin slices of meat, and a great deal of mustard; the bread being copious extracts from his early 'Reports' as Insurance Commissioner of Massachusetts and his more recent articles in insurance papers, the meat being a mere advertisement of his latest hobby, "savings-bank life insurance," and the mustard something very like contempt for those who will not jump on with him and ride as fast and as far as he. Mr. Wright states that "the object of this volume is to show that all the real benefits of life insurance can be obtained under a policy which can be perfectly understood by both parties, without obliging the individual to submit to any wrong at the hands of an autocratic or pseudo corporation—a policy which provides fairly and equitably for the contingencies of the party's ceasing to need insurance, or being unable to pay for it, as well as that of his death." The first duty of the managers of a life company is to protect the interests of its active members; and, secondly, to be as liberal to retiring members as is consistent with the utmost security of the former class, who intend to adhere to the terms of their contract until death. Mr. Wright appears as the champion of the retiring or "surrendering" class, and presents a scheme which supposes a very low commission to have been paid for procuring the risk, and provides a very light "surrender charge" or tax upon the policy-holder for abandoning the contract. But let the companies offer too great inducements and facilities for surrendering, and they at once destroy a great safeguard—one which gives them an advantage over savings-banks, trust companies, etc.—namely, a reserve fund which is not exposed to sudden and unexpected draughts or "runs." It is for the interest of the companies to make commissions and surrender charges as low as is consistent with obtaining the proper volume of new business, and the day may come when life insurance will so universally recommend itself that the present agency system will be entirely dispensed with, and the amount now paid out in commissions be applied to a reduction of the premiums. We can, however, safely leave it to right-minded, practical business men (of whom this business has its fair proportion) to hasten that day; the professional actuaries having almost as frequently misled the companies in the past as they have rightly guided them. Indeed, Mr. Wright's own words recur to us with unusual force: "The hieroglyphic veil which concealed from the common herd the learning of the ancient Egyptian priesthood was thin; and that which renders a priesthood of professional actuaries necessary for the safe conduct of modern life insurance is not thick. The more carefully, then, must it be preserved by those who have it for a livelihood."

BOOKS OF THE WEEK.

Authors.—Titles.	*Publishers.—Pricer.*
Adams (W. T.), The Yacht Club	(Lee & Shepard)
Aldrich (T. B.), Marjorie Daw and Other People	(J. R. Osgood & Co.) $1 50
Athol: A Tale	(Pott, Young & Co.)
Clarke (Mrs. M. C.), Girlhood of Shakespeare's Heroines	(G. P. Putnam's Sons) 2 50
Clarke (W. H.), Dollar Instructor for the Reed Organ	(O. Ditson & Co.) 1 00
Cook (Rev. F. C.), The Holy Bible and Commentary, Vol. III.	(Scribner, Armstrong & Co.)
Coxe (Rev. A. C.), Apollos; or, The Way of God	(J. B. Lippincott & Co.)
Edmund Dawn: A Tale	(G. W. Carleton & Co.)
Eiloart (Mrs.), The Boy with an Idea	(G. P. Putnam's Sons) 1 75
Elliot (Frances), Romance of Old Court-Life in France	(D. Appleton & Co.)

HARPER'S CATALOGUE. The attention of those designing to form libraries, or increase their Literary Collections, is respectfully invited to Harper's Catalogue, which comprises a large proportion of the standard and most esteemed works in English Literature—*comprehending over three thousand volumes.*

Librarians, who may not have access to a trustworthy guide in forming the true estimate of literary productions, will find this Catalogue especially valuable for reference.

The Catalogue is arranged alphabetically by the authors' names, anonymous works by their titles. The index is arranged by the titles of the books, besides having numerous appropriate heads, each general head being followed by the titles of all works on that subject.

Harper's Catalogue sent by mail on receipt of six cents.

Address HARPER & BROTHERS,
Franklin Square, New York.

G. P. PUTNAM'S SONS,
Fourth Avenue and Twenty-third Street,
New York,
HAVE NOW READY:

I.

CLARKE.—THE GIRLHOOD OF Shakespeare's Heroines. In a Series of Tales. By Mary Cowden Clarke, author of 'The Concordance to Shakespeare.' Large 12mo, illustrated, cloth extra, $2 50.

II.

A capital Book for Boys.

EILOART.—THE BOY WITH AN Idea. By Mrs. Eiloart, author of 'Cris Fairlie's Boyhood,' etc. 1 vol small 8vo, illustrated, cloth extra, $1 75.

NEARLY READY—ATLASES.

THE ATLAS OF SCRIPTURE Geography. 16 Maps, with Questions on each Map. Small 4to, cloth, 75 cents.

THE STUDENT'S ATLAS OF Classical Geography. 15 Maps. Imperial 8vo. With descriptive letterpress by L. Schmitz, LL.D. Cloth, $1 50.

PELLEGRIN.—PERSPECTIVE. The Theory and Practice of Linear Perspective, applied to Landscapes, Interiors, and the Figure, for the use of Artists, Art-Students, etc. By V. Pellegrin, M.S.A., Professor at the Military School of St. Cyr, etc., etc. 16mo, illustrated, cloth, $1.

☞ Send stamp for Putnam's New Autumn Catalogue.

THE WEEK IN TRADE AND FINANCE.

SEPTEMBER 30, 1873.

THE panic, commencing the week before last with the failure of several large private bankers and the suspension of important trust companies and incorporated banks, has so far subsided as to enable people to form a somewhat correct understanding of its cause. The failure of Jay Cooke & Co., in consequence of the large amount of deposits which it held being withdrawn, caused a feeling of doubt and insecurity among depositors with other firms, and the result was a general and overwhelming demand upon them for the payment of balances, which, on Tuesday, the 23d inst., caused the suspension of Henry Clews & Co., and on Wednesday that of Howes & Macy. The deposits in both of these houses were very large, and, considering the impossibility of compelling the return of loans made to other parties, it is not at all surprising that they were forced to suspend until they could gather in the money due them. Had these firms been able to have hypothecated the securities which they held against loans due them with the banks, against their checks, as the banks themselves had been able to do in the settlement of their indebtedness to the Clearing-House, every one of them, with probably one exception, would have been enabled to meet their liabilities; but the course which was open to the banks was closed to the private bankers. The suspension on Saturday, the 20th inst., of the Union and National Trust Companies was brought about by the same causes which operated against the private bankers, although the discovery of a defalcation by the Secretary of the former Company naturally aggravated its other troubles. It is alleged that the failure of the Commonwealth Bank was occasioned by an overdraft of one of its dealers, amounting to some $200,000. It is rather an interesting fact that this, the only one of the Associated Banks which has failed, was in former years a willing instrument in the hands of Fisk and Gould in their notorious locking-up operations made for the purpose of breeding panics. The banks have acted bravely in this trying emergency, and lost no time in making arrangements to meet it. The certification of brokers' checks in advance of a deposit of sufficient funds to meet them was stopped, we hope never to be resumed; the authorized amount of Clearing-House certificates was increased from ten millions to twenty millions, and, upon the absorption of the latter amount, the restriction was removed altogether, the payment of large amounts of currency was stopped, and all checks over a certain amount were certified as good through the Clearing-House.

The relief afforded by the Treasury, which, on Monday, gave notice that it would continue its purchases of 5-20's, though to what extent was not officially stated, was not such as was expected. A very small part of the bonds offered was from the national banks, where the want of greenbacks was most seriously felt. The sellers were mostly the savings banks of this and neighboring cities, who either locked up the currency in their vaults which they received from the sale of their bonds, or used it in purchases of other United States bonds, then temporarily depressed, after availing themselves of the benefit of the law giving them the privilege of demanding sixty days' notice from their depositors before paying them. On Thursday, the 25th inst., the Treasury ceased its purchases of bonds, and on the following day despatches from Washington stated that the Secretary would [or could] do nothing further towards relieving the money market.

There has been no regular quotation for money from day to day, but we hear of renewals of loans at from ½ to 1½ per cent. a day. The Stock Exchange remained closed during the entire week, and was not to be reopened until Tuesday, September 30, and then under certain restrictions regarding the selling out of stocks "under the rule," for the settlement of contracts. Meantime, its members have been forbidden to deal in stocks on the street; transactions, however, were allowable in private offices, and numerous attempts were made to get up a market in the street among outside parties, which latter was broken up by the police. The quotations made for stocks were very wide and irregular, but, so far as we could judge, this made little difference to parties dealing, as the sales were made under pressure, and the buyers were not disposed to limit themselves within 1 or 2 per cent. of the last reported sales.

The following will show the quotations before the panic set in, during the interval when the Exchange was closed (so far as they could be had), and since the reopening:

	Sept. 20.	*Sept.* 26.	*Sept.* 30		*Sept.* 20.	*Sept.* 26.	*Sept.* 30
N. Y. Cent. & H...	91¼	90	92	St. Paul pref.....	—	—	57⅛
Erie.....	53⅛	53	51	Ohio & Miss.....	27¾	29	29⅛
Erie pref.....	60 bid	—	66	Western Union....	55¾	56	68⅛
Lake Shore.....	83	75	77	Wabash.....	44	41	46
Northwestern.....	40	40	43⅜	Union Pacific.....	18	19⅛	21
Rock Island.....	88	86	90	C., C. & I. C.....	19	21	22
Pacific Mail.....	32	31	35	Harlem.....	103	110	114
St. Paul.....	32¾	30	35⅛	Han. & St. Jo. Com.	22½	21	24

Resort was also had to auction sales during the week, and the following were the prices realized at Saturday's sale of hypothecated stocks:

90 C., C. & I.	69	200 Pacific R. R. of Missouri	30
166 Del. & Hudson Canal..104, 102½,	101	100 Atlantic & Pacific pref.	15
100 Ohio & Mississippi pref.	60	500 Chi. & Northwestern pref..62¼ to 61⅛	
30 Morris & Essex	80	$9,000 U. P. land-grant bonds...63 to 64	
80 Del., Lack. & Western	85⅛	$3,000 U. P. income 10 per cent. b'ds.	53
100 Union Pacific	19		

Railroad bonds, especially those based upon completed roads, have not suffered so much in the general estimation as have stocks. The dealings in them attract less notice, and, as a rule, they are not bought and sold on margins, or sold "short"; and for these reasons their average of prices is not subject to the same fluctuations. We note sales of Central Pacifics at 90 to 95; Union Pacifics, 73 to 75; Land-grant, 68 to 70; Incomes, 53½ to 55. Curiosity is manifested in the dealings in bonds of railroads not yet introduced on the stock list. The *Financial Chronicle* gives a list of quotations (wide, of course, for the more prominent issues): Canada Southern 7s, 72 to 73; Kansas Pacific 6s, gold, 70; N. Y., Oswego, and Midland 7s, 67½ to 75; Chesapeake and Ohio 6s, gold, 81; Northern Pacific, 70 to 75; Burlington, Cedar Rapids, and Minnesota 7s, gold, 86; Indianapolis, Bloomington, and Western 7s, gold, 82.

It is probable that the reopening of the Exchange will lead to some plan for the establishment of a stock Clearing-House, organized upon some such principle as that of the Gold Exchange Bank, through which the clearances of the Gold Exchange are made, the want of which has long been felt, if not by the brokers, at least by the Wall Street banks, which for years have been loaning their credit in the form of over-certification.

The President of the Continental Bank has purposed making that institution the Clearing-House Bank for the Stock Exchange, and keeping only brokers' accounts, all mercantile accounts being asked to withdraw. The proposition looks at first sight like one that might work to mutual advantage.

The closing of the New York Stock Exchange for nine days—an occurrence without parallel in its history—must be regarded as a fair indication of the severity of the monetary spasm now passing away. Opinions now differ as to the wisdom of the measure, though it was generally applauded at the time; some holding the view that it prevented the panic from spreading; others the conviction that it only aggravated its evils, and that the true way would have been to let the panic run its course, hit whom it might, predicting a quicker and healthier recovery thereby. It is now obvious that the occurrence was not merely a "Wall Street flurry"; it soon assumed larger dimensions, involving the banks of nearly every town and city east of the great plains. The contrivance of the banks of the interior cities, Chicago, St. Louis, Louisville, Cincinnati, Pittsburg, Baltimore, Washington, and Richmond, like that of New York City, has all the elements of a suspension of payments, except the name. It is now regarded as a legitimate expedient to stave off the consequences of an unreasoning, baseless, senseless loss of confidence.

Attention has been called to the fact that we have now at least three kinds of currency in use, no two of which are of precisely the same value, viz., gold, legal tenders and bank-notes, and bank certifications. Of the three forms of paper money, the National bank-notes are a little the best in popular estimation. Both legal tenders and bank-notes, however, have commanded a premium, as against bank checks, for several days past, as high as 2½ and even 4 per cent. difference being made. With the restoration of confidence, this difference between lawful money and the money of commerce will disappear. The latest announcement of the Clearing-House Committee, that they will, if necessary, issue an additional twenty millions of these loan certificates, has awakened a keen interest to see if the seeds of a new distrust are not contained in this practice. As we go to press, the occasion for such an enlargement of this policy seems to have passed.

Gold has been unusually unsteady for many days, having gone up on Saturday last to 114¾ on the announcement of a hitch in the daily clearings, and down to 111 at a later day. The rallying-point seems to be about 112, sometimes above, and quite as frequently below.

Foreign exchange has been demoralized, there being so little money with which to buy bills. Quotations have ruled as low as 101, though there is a reaction, and sight bills are at about 107½@108, or two per cent. below the actual parity of exchange. Appeals have been made to the Secretary of the Treasury and to the banks to purchase bills of exchange attached to bills of lading, in order to relieve the wants of produce forwarders. This function seems to be entirely outside of the Government province, and it is likely the forwarders will be able to make private arrangements with the banks. All the steamers thus far have carried out full cargoes, and there is no serious liability of stoppage of our exports.

The Nation.

NEW YORK, THURSDAY, OCTOBER 9, 1873.

The Week.

THE panic died out on Friday, which was settling day at the Stock Exchange; but, contrary to the anticipations of the timid, produced no failures, and was indeed marked by a rise of stocks and decline in the premium on greenbacks, which at this writing has disappeared. Indeed, from the purely financial side, the sky looks very bright again, but the political financiers are in fresh trouble. Mr. Richardson, who is not either an eminent financier or an eminent lawyer, has assumed, in defiance of the report of the Committee of Congress, and of the soundest opinion of the country at large, the right to reissue what he calls his "reserve" of $44,000,000 greenbacks, or, in plain English, a quantity of greenbacks called in under Secretary McCulloch for the express purpose of contracting the currency, and which ought to have been cancelled and destroyed. Mr. Richardson exercised this self-assumed authority by issuing $5,000,000 last fall, as he said, "to move the crops," but, as other people said, to make money easy just before election. Withdrawing them when the political crisis was passed, he did much to produce the stringency of last winter and spring, which led finally to the present collapse; but many people thought he had learnt a lesson which would save him in the future. When he and the President came, a fortnight ago, and valorously withstood the entreaties of the bankers at the Fifth Avenue Hotel, and refused to "violate the law" by issuing the greenbacks to stop the panic, pious people in the country began to thank God for Mr. Richardson. It now appears, however, that that display of scrupulousness was a little comedy, for he has issued $2,000,000 of "the reserve," and will probably issue more.

There is, however, worse than this to be told. It appears that he has been keeping a balance of $287,782 of the Government money on deposit in the First National Bank of Washington, of which Mr. H. D. Cooke, the brother of Mr. Jay Cooke, was President. The bank failed when Jay Cooke & Co. failed, and it now appears that Mr. Richardson only held security for $100,000 of this sum, although the law directs him to deposit no Government money in a bank without obtaining "satisfactory security by the deposit of United States bonds or otherwise." In other words, he unlawfully lent $187,782 of Government money to a political friend. Foremost among the reforms now sought for ought to be stern prohibition of political banking and political issues of paper money.

Last week, in speaking of the failure of Jay Cooke & Co., we probably conveyed the impression to many persons that the house of Jay Cooke, McCulloch & Co., which does a portion of the Government banking business in London, had also failed. This, however, is not the case. It has paid all demands on it, and will continue to do so, and is, we are requested to state, entirely separate and distinct from the New York firm. The appearance of connection between the two has, we believe, been created by the fact that Mr. Cooke, of Jay Cooke & Co., has an interest in the other firm, which, we believe, still stands very well in London, and has nothing to fear from the condition of things on this side of the water.

The *Economist* (London) has an article on the lessons of our panic, some points of which are worth reproducing. The main one is this, that the currency in which the banks are by law required to keep their reserves, and which is the legal tender, is a fixed quantity. It cannot be increased by importations from abroad, as gold coin can, so that as the demands of the country for currency to transact its business increase, as they do year by year, not only do prices decline, including that of gold, but the reserves of the banks become harder to keep up. Consequently, as long as the volume of legal tenders remains the same, we are each fall harder pressed for money "to move the crops"; and the minute this pressure begins to make itself felt on the banks, they are forced to diminish their accommodation instead of increasing it, in order to keep up their reserves, which they cannot replenish by drawing on other countries for gold, as the Bank of England does, and which, if they could afford to keep gold as reserves, they are forbidden by the usury laws to obtain by raising the rate of interest, as the Bank of England does. If, on the other hand, the reserves are allowed to fall very low, the seeds of a panic are at once sown. There are two ways out of the difficulty—one to keep inflating the currency from year to year until it would all disappear in a grand crash in the nature of national bankruptcy, and the other to get what additions to it we need to enable us to carry on our business by bringing into use once more the currency of the civilized world—gold and silver. We may add that one or two of these points were made in an able letter in the New York *Times* the other day, signed "Knickerbocker."

The meeting of the Evangelical Alliance has happily filled the place in the public eye which was last week occupied by the panic. It was feared that the postponement of the meeting in 1870, in consequence of the outbreak of the Franco-German war, would have deprived the present attempt of much of its *éclat*, but the gathering seems to be as full and as enthusiastic as there was any good reason for believing it would have been if it had taken place when originally intended. The audiences are as large as the various buildings in use will hold, and there seems to be no limit to their fervor, or to that of the speakers. The Dean of Canterbury taking the communion at Dr. Adams's Presbyterian Church was one of the strange sights of the occasion. A large number of the sermons and papers take up directly or indirectly the question of the best mode of dealing with modern scepticism, but it cannot by candid men be said very satisfactorily. The great difficulty of dealing with modern scepticism is one which the speakers of the Alliance do not seem to recognize, and that is, that it is what the physicists call an imponderable agent. You cannot lay your finger on it, and can hardly find a man who will appear and answer for it; it is somehow in the air, however, and is found everywhere, the church included. Religious beliefs are not destroyed by argument; nobody openly assails them; they are not formally abandoned; and yet, when you come to question religious men, or they come to question themselves, you find that they have ceased to hold a great many doctrines they once held, and have ceased to know where their belief stops and their unbelief begins, and yet cannot tell why or wherefore. The process of decay is of course, everybody knows, due mainly to the spread of the scientific habit of mind, or, in other words, the doubting habit of mind; but it is due also to the increasingly commercial character of the church organization. A leading church in this city has had, until this summer, its choir "run" at enormous expense by an enterprising stock-broker on precisely the same principle on which he would have conducted the opera—high pay for good music, with plenty of variety. As he has just "burst up" in the panic, the church will now probably praise God more economically. We are sorry to see no papers on this theme in the programme of the Alliance.

The exposure of the assessments in the St. Louis Post-office is apparently having a very good effect. The clerks in the Baltimore Custom-house, it is said, have declined to pay the tax of one and a half per cent. levied upon them, and the authorities have only been able to collect $80 instead of $2,000. We mention this chiefly for the purpose of calling attention to the disgraceful manner in which the new Chairman of the Commission is abused in the press for his attempt to perform the duties of his office. He is continually spoken

of as if his assumption of the office had been a sort of trick to throw dust in the eyes of the public. From what we know of the matter, we are able to say that the Administration was alarmed at the resignation of Mr. Curtis, and did make an honest attempt to secure a good officer in his place; and there has certainly been nothing to show, since Mr. Eaton took charge of the Commission, that he is actuated by anything but a sincere desire to do his duty, and this rebellion in Baltimore looks like a real victory for the regulations established by the Commission.

General Barlow, we grieve to say, has fallen into deep disfavor with the Custom-house publicists, and they threw him overboard at Utica without the least ceremony, after he had yielded to the solicitations of the bar and of the best portion of the Reform party so far as to consent to serve a second term. The fact is that he is a great deal too active and vigilant and aggressive to suit the purposes of the Custom-house Ring. They have accordingly put in General Barlow's place a highly respectable lawyer, whose advanced age—he is seventy-three—and quiet temperament will prevent his giving trouble to their corrupt hangers-on. Mr. Silliman's age, even if he were a man of more active habits, would be a disqualification for an office which, under existing circumstances, is neither deliberative nor administrative, but combative. The Attorney-General of this State has to be at present a fighting man to do any good, and this the Custom-house brethren are determined he shall not be. The great fount of corruption is the canals, which General Barlow has been exploring with much effect, and after doing so he reached certain conclusions with regard to Mr. Taylor, whom the Ring has just nominated for State Engineer, which he communicated by letter to the Convention. The managers prudently suppressed it, however—and it has not seen the light even in the "reform" papers—and nominated Mr. Taylor all the same. We doubt very much whether "the party" will ever require General Barlow's services again.

The Democratic State Convention at Utica appears to have been an unenthusiastic body, but it was at all events not so dull as its Republican predecessor, there being a rather unexpected disturbance in the way of an attack on Mr. Thomas Kinsella, and an entirely foreseen disturbance over the question of admitting the Apollo Hall delegates instead of the Tammany. Tammany, as always, carried the day, and Apollo Hall departed in wrath. Probably Republicans who think that this will inure to the benefit of the Republican candidates make a mistake, or are at least premature. What arrangements the leaders of the two factions may make or may fail to make between now and election-day cannot as yet be told or known. The organs of both factions are at present urging a united support of the State ticket and praising the platform as embodying true Democratic principles. It begins with a number of undeniably good propositions taken from the works of Thomas Jefferson—assertions in favor of the freedom of the press, for example, the freedom of religion, the citizen's right to the writ of habeas corpus—to which last assertion a kind and polite Administration organ in this city refers as one more proof of the chronic anxiety of Democrats about keeping out of jail. However that may be, the preamble is open to the objection of being composed of glittering generalities. What follows is more definite. "The party will urge free-trade legislation," it says, for one thing; but, in the light of past events, it is not unfair to regard this for the present as so much platform talk. A similar resolution in a Pennsylvania Democratic platform would undoubtedly mean more, but that we are not likely to get. Of course, the "salary grab" is denounced, and the lead of the Ohio Democracy in denouncing the President for his signing the bill is followed, but with a difference, for our New York Democracy point out that the President signed the bill just after another one—a bill to increase his salary, but not that of Congressmen—had failed to pass. This certainly is not a pretty aspect of the transaction, whichever way we look at it. General Grant's conduct in the Louisiana business is of course severely blamed. The nominees of the Convention are admitted to be good men. There is, at all events, no Taylor among them.

All but two of the murderers of Gen. Canby have been hanged, and the Modoc question is out of the way. The sentences of the two survivors were commuted. That Captain Jack's career is over is certainly a subject of congratulation, but the way in which he has been hung is not a way which can in future cases be safely taken as a precedent. The Attorney-General advised the President that a "state of war" existed between the Modocs and the United States, and that, therefore, the prisoners could be tried by a military commission for a violation of military usage in decoying and assassinating General Canby. It is obvious that, if there is a state of war in the United States every time two or three dozen desperadoes get possession of a lava-bed and defy pursuit, there will be a good many more wars going on than most people will like to anticipate. On the Attorney-General's principles, Shay's Rebellion was perhaps a war between the United States and Shay. The fact that we make treaties with Indians has little to do with the question. We make treaties with Great Britain; but if thirty Englishmen, resident in Sing Sing, should make an escape and resist the ordinary processes of capture, and United States troops should be called for by Governor Dix, we should hardly call this a state of war between Great Britain and the United States.

The great *Alabama* Claims Award swindle is ably discussed in the current number of the *Law Review*. The $15,000,000 awarded by the Geneva Tribunal, it will be remembered, instead of being distributed among the sufferers from the ravages of the rebel cruisers, was appropriated by Congress to be invested in 5 per cent. registered bonds of the United States, "to be held subject to the future disposition of Congress." To make the matter more plain, we may say that this money, which belonged to the insurers and shippers who had lost it, was taken by their designated agent, the United States, who had received it for them in open court, and then used by that agent to help it pay its own debts—for it cannot be doubted that even the temporary investment of so large a sum in what was then and indeed still are the "new fives," is a great help to the Government in re-establishing its credit. Not only did Congress do this, but in addition it declared in as open a way as it dared, first, that the insurers were entitled to no compensation whatever, because they had received compensation through their war premiums, and, in the second place, that no private person was entitled to any. We quote the language of the Committee which had the subject under consideration: "Your Committee have come to the conclusion that the amount awarded at Geneva *is the money of the United States*, to be disposed of at its pleasure, subject to no trust, and especially to no legal rights in any individual or corporation by whom a legal or equitable claim can be set up or maintained to any part of the sum awarded, as against the United States."

The extraordinary report of the Committee was never supported by any real argument whatever; but the *Law Review* examines in detail the specious insinuations of the Committee, and shows, 1st, that as the claims preferred at Geneva were of two kinds, those of private individuals and those of the Government for a few ships of its own and indirect damages, and as the claims of the Government for indirect damages were ruled out of court, it follows inevitably that the only claims for which the "gross sum" was awarded were those of private individuals, and of the United States for the one or two ships of its own which were lost; 2d, that, so far as the private claims were concerned, the United States, having undertaken the collection of and recovered judgment for them, stands, according to universal principles of law and equity, as agent or trustee for the claimants, and its present proceedings are simply a barefaced fraud; 3d, that with regard to insured ships the underwriter stands in the

shoes of the owner as a claimant upon this fund, and for this it cites precedents so well known that they, too, make fraud the only word applicable to the proceedings in Congress. The position taken by the *Law Review* is the same as we have always taken in these columns. The article, which is as valuable for the clear moral insight as for the legal acumen it shows, ought to be read by every one who is interested in the honor of the country—a class of people whose existence the *Law Review* at present seems to think in doubt.

Those who recollect the fierce discussion carried on a year ago between Father Burke and Mr. Froude must be rather disappointed at the tameness of Mr. Bradlaugh's lecture on Ireland. For the fire-eater he was reported to be, he is very mild indeed. As to Ireland, he is opposed to separation, opposed to war, opposed to lawlessness of all kinds. He thinks Mr. Gladstone's land-law did not go far enough, and that it ought not merely to have enabled the Irish peasants to become landed proprietors, but should have made the change compulsory. He is in favor of "Home Rule" also, and religious equality. His audience, who came to his lecture expecting to hear an extremist, seem to have been a good deal discontented, and one gentleman is referred to in the *Tribune's* report as shaking his head at all Mr. Bradlaugh's points throughout, and being thereupon accused of ignorance of the subject by the lecturer. At the close of the address, the audience were invited by Mr. Bradlaugh to put a few questions to him, and it may be inferred from the tone of these questions that they considered him rather too conservative for their purposes; among other things, he had laid it down as a political principle in his lecture that what was right in one country was right in another, and that the Hungarian and Polish question was practically the same as the Irish. He was asked why, if this was so, the Irish question was not practically the same as the American, which was solved a century since by separation. This dilemma he avoided with the simplicity of a child by saying that the circumstances were different in the two cases.

Things are apparently looking worse for the Carlists than when Castelar made the speech three weeks ago in which he acknowledged that they were 50,000 strong, and would probably soon try to cross the Ebro. The want of cavalry and artillery has kept them in the hills, and in the hills they cannot stay very long, as they are not prepared for the cold weather, and they have exhausted the country around them. They have evacuated Estella, one of their latest conquests. Cartagena still holds out, but is said to be on the point of surrendering, and the revolted iron-clads are trying to pick up a precarious subsistence by plundering the unprotected towns along the coast. The Madrid Government has thus gained in appearance by the increasing disorganization of their wretched enemies, but there is no reason for believing that the state of things is radically any better than it was a month ago, or that it is likely to be any better at present.

The reason why has been well summed up recently in the *Revue des Deux Mondes* by M. Cherbuliez, in an essay on Spanish politics, where he describes the situation as follows: A government without authority, moving in space, giving advice rather than orders, and apparently taking gesticulation for action; the public revenues exhausted in their very source; bankruptcy almost inevitable; a civil war of which nobody can foresee the end; continual revolts of cantons and villages, which declare themselves independent states; rich cities a prey to chance demagogues and cut-throat socialists; murders, fires, and frightful confusion of all powers, all trades, and all ideas; here, priests acting as guerilla chiefs, upsetting trains, bastinadoing alcaldes, shooting prisoners, and robbing peasants; there, mutinous soldiers chasing and killing their officers; elsewhere, political adventurers in white cloaks, with feathers streaming in the wind, offering themselves as candidates all over the country, with valorous airs and a battery of cannon to support their eloquence; at Madrid, a parliament in which everybody, except the men of merit, wants to be minister; clubs of ranters who declaim, with foam on their lips, on collective property and on the virtues of the Fourth Estate, and in which altars are raised to Holy Disorder—a state of things, in short, which has wrung from one Spanish journalist the exclamation: "In our unfortunate country, nobody any longer is willing to obey, and nobody any longer knows how to command." Even after making allowance for exaggeration, the disease here described is too deep-seated to be cured in a month or in a year, indeed, we might say, in a generation.

In France, the monarchical preparations for a restoration are daily approaching completion, and the attempt will doubtless be made on the meeting of the Assembly to proclaim the monarchy, draw up a constitution, and offer the crown to the Comte de Chambord. As we have for some months ventured to predict this result as near at hand, we have nothing to add by way of explanation. The greatest difficulty in the monarchical problem has been the monarch himself, whom it has been very hard to bring down into this century. The recent adhesion of the Orléans family to Henry V. without ifs or buts, and the withdrawal of the German army, have precipitated the crisis, and his adherents have lately labored with him with enough success to get from him a letter, in which he denies that he contemplates reactionary measures or thinks of attacking Italy. In the meantime, the Clerical party, in their eager fanaticism, are evidently very near spoiling the game, and, besides frightening the Italians, are frightening the more moderate Monarchists, one of whom, the Duc de Broglie, has felt it necessary to declare clerical domination in France impossible. The Extreme Left has been sufficiently sobered by the gravity of the situation to announce their willingness to act with the Left Centre, and under the lead of Thiers, who has gone back to Paris to rally his forces; and they are even going to support M. de Rémusat as a candidate for the Assembly in one of the Departments—the same Rémusat, be it observed, whom they defeated last spring with a red-hot Communist, thus bringing about M. Thiers's downfall and throwing the Government into the hands of the Monarchists. As usual, their wisdom comes a little too late. The Comte de Chambord has moved down from Frohsdorf to Geneva, in order to be near the scene of action; and, indeed, everything seems to be in readiness for what the reporters call a "lively time." It is said that actual canvass has secured 350 votes in the Assembly for the monarchy. The chances seem to be that the Monarchists will have their own way in that body, and then all will depend on MacMahon, who will doubtless obey the majority. Then we shall have fifteen or twenty years of republican attempts to overthrow the monarchy, thus preventing the formation of political habits among the people, and then another revolution, more sham republic, and so on.

The topic of most interest in the English news is the Ashantee war in Western Africa, in which an attempt is about to be made to chastise a barbarous potentate, one hundred miles in the interior, who is said to kill about twenty-five men a day, and came down not long ago and attacked the British settlement on the coast, and seized and imprisoned four English missionaries. The English commodore at the station pushed up the river in boats to make a reconnoissance, but fell into an ambuscade and suffered severely, and there is now nothing for it but to push an expedition up to the capital, as in the Abyssinian war. But this is a serious matter. Nearly one hundred miles of pestilential swamp have to be traversed, and all supplies have to be carried by the troops. Accordingly, materials for a railroad forty miles long have been sent out from England, and traction engines for ordinary roads, and 3,000 European troops are to show the way to a large native force raised for the occasion, the whole commanded by Sir Garnet Woolsey, who overthrew Riel, the Dictator of Fort Garry.

THE NEW REPUBLICAN GOSPEL.

MR. BRADLAUGH, who has been for some years a very prominent Radical agitator in England on behalf of various changes, both political, social, and religious, has come over here to add a plea for sympathy for the English Republic to the numerous pleas addressed to us during the last year or two on behalf of the French Republic and the Spanish Republic. He has lately become a bugbear to English Liberals as well as to English Conservatives, owing to the excesses of his brethren on the Continent. Indeed, it is the opinion of competent observers that the late acknowledged decline in Mr. Gladstone's popularity and the numerous triumphs of the Conservatives at elections, are the result of a growing feeling in the Liberal ranks, that a persistent following of Mr. Gladstone much further would bring the country up to the Bradlaugh mark. He has been made all the more dreadful to quiet people by the fact that he has been in the habit of seasoning his assaults on the constitution with assaults on the Christian church. But then, it must be confessed that he needs his peculiar habitat to be very much of a monster. Out of England he is a most innocuous person. When he goes to Spain or France to see his brother Republicans, he seems to them a kind of tepid reactionary, so moderate and patient is he, and so low a view does he take of the political capacity of the masses, and so long does he propose to wait for the millennium. Over here, too, his eccentricities both in religion and politics are very familiar to us. There is hardly any American who goes to lectures and reads the newspapers who is not well acquainted with him under various other names, female as well as male. He has discoursed in this country for a great many years, on all sorts of matters, without doing much damage or shocking many people's nerves.

On Friday night he gave us an exposition of his republicanism, which will strike, we think, most people as the mildest form of it they have ever listened to. It simply amounts to a belief that a republic is the best form of government when people are ready for it; that people are not ready for it in England; but that a small band of workers, including Mr. Bradlaugh, are endeavoring to prepare them for it—and for these he invokes our sympathy. At the French "Republic" and the Spanish "Republic" he openly laughs in a derisive manner.

If this account of his tale be true—and we refer those who question it to the *Tribune's* report of his lecture—many will ask, what brings such a man here; and why has there been so much fuss over his coming? If he were able to say that he and his friends were going to set up a republic in England shortly, and that he would probably be a prominent member of the government, his appearance would naturally excite a good deal of interest; but he does not profess to be able to do anything of the kind. He simply says that he is engaged in some very meritorious missionary and educational work, which at some distant period will bear fruit. In other words, his message to us is that there is a good time coming in England, and that we shall see it if we wait long enough. His coming out here to lecture, under these circumstances, with the expectation of making a sensation—we do not use the word in any depreciatory sense—is to be explained by what we cannot help calling the hallucination under which nearly all European republicans, and a large number of Americans, labor as to the nature of republican propagandism. The belief is almost general in Europe, and is here widely spread, that this Republic—the only one of importance there is, except Switzerland—was founded after mature deliberation by a body of eminent men upon the comparative merits of the various known forms of government; or, in other words, that Washington and Madison, and Jay and Hamilton, and the other Fathers, laid their heads together and said: "Go to; let us found a republic"; and that anybody who wants, even in our day, to stand in the front rank of public benefactors, ought to imitate them as far as possible—that is, set up republics and reject monarchies wherever he can. But, in point of fact, the Fathers did nothing of the kind. They did not choose between rival forms of government. They provided machinery for administering the form of government which American society produced. They had not much more choice about that matter than about the course of the Hudson. They did not go about lecturing against monarchy or in favor of democracy; they simply took the existing materials, and built of them such a political fabric as the community called for. They found republican institutions existing, and they based on them just as much of a republic as the manners and ideas of the time allowed; that is, a republic of restricted suffrage, of administration by local notables, and of tolerated slavery. Their republic, however, would by no means have suited the ideas of our day, and accordingly, another and very different one has taken its place—a republic of perfect equality, of male suffrage, and of administration by local "workers." This change, too, has been brought about, not by lectures on forms of government, but by changes in the national manners and the material condition of the country. In other words, we have had in the United States no agitation in favor of having potatoes produce beans, but have confined ourselves to growing as good beans and as good potatoes as the climate and soil would permit. According to most European republicans, however, a republic can be prepared beforehand by any body of "thinkers," however small, and then the masses be driven into it, and made to live in it, no matter what their manners and ideas may be. It is in this little job that Gambetta and his friends are engaged in Franc, and Castelaer and his friends in Spain.

The English republicans, however, are conscious, like Mr. Bradlaugh, of the faults of the Continental theory and method, and, when they lecture on republicanism, talk almost as sagely about its condition as John Stuart Mill or Herbert Spencer. Gambetta says, frankly, "Let us set up a republic, and we shall be happy and prosperous." Bradlaugh does not say this, but he says, "Let us get ready for a republic, by the acquisition of the virtues and the formation of the habits which make republics possible, and then we shall be rewarded by having one." But then, anybody who says this, has no need to go about as a republican missionary. What he is really advocating is knowledge, temperance, business habits, industry, self-restraint, reasonableness, foresight, and love of liberty and of local self-government. It is absurd to suppose that a people will cultivate these virtues simply in order to rid themselves of kings and queens. What Moses and the Prophets, and Christ, and Confucius, and Socrates, and Paul, and Peter have been trying to do for thousands of years, by the aid of the loftiest hopes and most dreadful terrors that human tongue can paint, Messrs. Bradlaugh and Odger and Sir Charles Dilke are hardly likely to effect by promising people that they shall eventually elect a president every four years. In other words, when the people of England are virtuous and sensible enough, a republic they will have. But a republic will then be no very marked or very sensible addition to their blessings. We tell a boy to work hard, and give himself to his books, that he may become a banker, and not that he may wear broadcloth and hang out a banker's sign. Human life under republics, as we at least know, is attended by a large proportion of the evils which attend it under monarchies. It has its plagues, in the shape of demagogues and charlatans and "workers" and monopolies and rings and panics. Indeed, republicans sometimes die, and are often sick. In the two republics with which we are acquainted, a man's chances for the free play of his faculties and the just reward of his labor are undoubtedly better than those which fall to his lot under any monarchy. In other words, a republic is a nobler form of government than a monarchy can ever be. But there is in no republic such a state of bliss as to make the prospect of it do for human character what neither glimpses of heaven nor of hell have thus far succeeded in accomplishing. The great superstition of our day—for our day, too, has its superstitions—is that the world is to be saved by giving new names to old facts, or by reshuffling packs of cards or putting the pea under another thimble; and we accordingly have bands of apostles who think they are going to light up the dark places of the earth by telling men that, if they are very good and very wise, they will, in process of time, be able to elect a president

instead of a king. The answer of the heathen to this gospel is, however, a very natural one: "When we are good and wise, we shall do as we please, and shall not need your advice." When France and Spain are in the main inhabited by republicans, a republic there will be in each country as sure as fate, and the gates of hell will not prevail against it; but all attempts to establish one any sooner, will simply keep up the alternations of anarchy, monarchy, and democracy which we have witnessed the last fifty years. In England, too, there will be a republic when people want one, and not a moment sooner; and they cannot be reasoned into wanting it, because no government ever did or will rest on opinions. Governments rest on habits, and the habits are the product of a thousand influences, social, commercial, and physical, and the first condition of their growth is a long period of order, and security, and stability. We accordingly see that no republic has ever been established yet either by discussion or by disgust. All the successful republics of which we have any knowledge have been produced by the growth of institutions and political habits, which finally rendered the people indifferent to or independent of the monarchy, so that they threw it aside as one throws aside an old coat, as a matter of course, and not after hearing their Bradlaughs and Gambettas and Castelars recite themes before them on the best form of government. They who fought at Morgarten, and Naseby, and Bunker Hill had not republicanism in their heads simply; they had it in their bones, and set up republics not as cure-alls, but because that was the way in which they liked to do their political business.

THE WATERED-STOCK HALLUCINATION.

AMONG the various cries raised during the last two or three months by the railroad and agricultural moralists in the West, there has been one which has seemed to take a strong hold upon the popular imagination and belief. The cry to which we refer is a denunciation of the immorality of the railroads in regulating their charges for freight by the amount of stock they have issued. A railroad is built, it is said, for a certain sum of money, say a million dollars, and a certain rate of freight is established by the directors which is fair enough, and will enable them to declare a dividend. Then the directors, like the shrewd knaves they are, come together and pass a vote to water the stock to double the previous amount. Then, well knowing it to be impossible to pay dividends without increasing the rates, they double these, and out of the poor farmers' hard-earned savings the money is wrung. This process is repeated every time the stock is watered; and, naturally enough, we have in the end granges, farmers' associations, new parties, denunciations of capitalists, and threats of lynch-law. That the practice of increasing the rates of freight as the stock or debt of roads increases is immoral, there can be no doubt; it is a practice not merely unjust, but in its very nature fraudulent. It is a fraud upon the stockholders, because, as it cannot be indefinitely repeated, there must come a time like the present—a time of retribution—when watering must come to an end, and transportation be directed to new routes. It is a fraud upon the public, because it is a tax collected under false pretences. We are even willing to go further than this, and to admit that, for railroads caught in the act, hardly any punishment, even to the extent of absolute disfranchisement and expatriation of the directors, would be too severe. There is, however, one difficulty in the way, which is a difficulty common to many of the proposed reforms in railroad management—the practice alleged has absolutely no existence, except in the heated brain of the agitators who have imagined it. There are no roads in the United States on which any attempt has been made to increase the freight earnings in proportion to the watered stock or debt, or, if the attempt has been made, it has failed so egregiously as to prove the managers of the roads singularly incompetent to transact their own business. As this fallacy with regard to the ratio of freight to debt is a specimen of the kind of ratiocination with which the farmers and their unthinking supporters are now deluding themselves and the public, we shall proceed to examine it, not much in detail, for, if the alleged system exists, it must be very easy to detect its existence, and shall attempt to guide our investigation by the actual facts of the case instead of by fancy.

The theory, it will be seen, may be tested in two ways—a comparison may be made between a number of different railroads to see if any constant relation exists between the debt and the freight earnings, or the career of several roads may be traced separately, for the purpose of seeing whether the freight earnings are advanced side by side with the liabilities, or whether there appears to be any connection between the two like that imagined to exist. Of course it is to be assumed at the outset, that with the growth of railroads in a new country both the earnings and liabilities increase; but the question is whether the increase in the earnings is made to bear a certain proportion to the debt, and what that proportion is.

'Poor's Railroad Manual' is acknowledged to be the only authoritative compilation of facts in the United States with regard to railroads. The 'Manual' for this year contains a tabulated statement of the earnings, expenses, and liabilities of all railroads in the country, arranged by States. In order to determine how far the earnings of a railroad from freight are determined by the amount of the stock or debt, we will select, at random, any State, and see what the ratio actually is. In order to be on the safe side, we will not take merely the stock, but the entire debt of each road (including stock, bonds, and all other liabilities), and at the same time take the gross earnings from freight, or, where these are not given, the gross earnings from all sources, as there is no probability that these are "doctored" in any way.

The first railroad in Ohio is the well-known Atlantic and Great Western. Its total debt is now, or was at the time this 'Manual' was completed, $83,000,000. The gross earnings are put down at $4,126,479, or five per cent. on the debt. There are no dividends. The next largest debt is that of the Lake Shore and Michigan Southern, which is put down at $78,820,219, while the gross earnings from freight are $12,613,499, or between 16 and 17 per cent., while the dividends are eight per cent. The debt of the Pittsburg, Fort Wayne, and Chicago is $35,852,516; the gross earnings from freight are $6,851,374, or between 15 and 16 per cent. It declares a dividend of 7 per cent. The Marietta and Cincinnati has a debt of $26,287,980, while its earnings from freight are $1,409,567, or say 6 per cent., and it pays no dividends. On the other hand, turning to the smaller roads, the Ohio railroad with least debt is the Carrollton and Oneida; its debt is $14,600. Its gross earnings from freight are put down at $3,131, or about 20 per cent., and it declared 15 per cent. dividend in 1870. The Iron Railroad, with a debt of $142,948, earned from freight $91,368, or 75 per cent., while it declared no dividends at all. We have gone through the twenty-four Ohio railroads with substantially the same results in all cases—that is, no result at all. We have failed to detect the slightest indication of a fixed relation between the debt and the earnings. We should like very much to be informed by some one who interests himself in the farmers' movement, when he speaks of the directors "increasing the freight charges to pay interest on watered stock," which of the dividend-paying roads in Ohio he has in mind. Out of twenty-four, there are only seven which pay dividends at all, and so we suppose it must be one of these. We should also like to know, if it be true that the freight income is made to increase with the debt, what is the ratio of increase, and how many roads in the country it applies to. Finally, it would be interesting to learn why a director, who can, by means of fraudulent contracts and leases and new lines, swindle his stockholders day in and day out without fear of detection, or at any rate of pursuit, should resort to the device of laying an exorbitant tax upon the producer, which he knows must in the end bring transportation to a standstill.

It may be objected to this examination of the matter that it is deceptive, because it compares one road with another instead of tracing the career of a single road from year to year. Though we do not think there is anything in the objection, in order to set all doubt at rest we have examined the matter in the other way also, taking for the purpose of examination the following stocks, which

are called in the financial columns of the newspapers "investment stocks," and may therefore be fairly supposed to be those whose directors endeavor, in accordance with the theory, as far as possible to water and increase the earnings of the stock. They are Erie preferred stock; Michigan Central; Cleveland and Pittsburg guaranteed; Cleveland, Columbus, Cincinnati, and Indianapolis; Pittsburg, Fort Wayne, and Chicago guaranteed; Delaware, Lackawanna, and Western; Chicago and Alton; Chicago and Alton preferred; Chicago, Burlington, and Quincy; Morris and Essex; New York, New Haven, and Hartford; Albany and Susquehanna.

In 1862–3 the total debt of the Erie road was $40,066,200, and this debt gradually increased until it was, in 1871–2, $118,295,979 38, an increase of nearly two hundred per cent. The freight earnings during the same period had increased from $8,432,234 47 to $14,509,745 47, or about seventy-five per cent. The dividend on the preferred stock for the year ending December 31, 1872, was one and three-fourths per cent. The total debt of the Michigan Central has increased from $15,188,190 in 1865–66 to $25,557,039, or 40 per cent.; the stock having increased in the same period from $6,982,866 to $17,987,048, or very nearly 200 per cent., while the earnings only increased (this sum apparently included passenger earnings) from $4,446,490 51 to $5,313,074 03, or 16½ per cent., and the dividends have become very uncertain and speculative. The debt of the Cleveland and Pittsburg Railroad in 1865–66 was $7,264,435, but in 1871–72 it had increased to $15,070,493 31, or more than 100 per cent., while the earnings had increased from $2,612,186 17 to $3,980,647 29 in 1870–71 (the earnings for 1871–2 are not given), or about 16½ per cent. On the Cleveland, Columbus, Cincinnati, and Indianapolis Railway the gross earnings from 1868 to 1872 increased from $2,918,347 83 to $4,573,170 85, or say 50 per cent., while the liabilities had increased from $13,034,346 70 to $18,306,687 01, or about 40 per cent. We have examined the other roads on the list, but to state the result in figures would merely be to give a quantity of statistics which in the end show nothing at all.

It appears sufficiently, in fact, from the figures already given, that there is no fixed relation whatever between the earnings of a railroad and the amount of its stock and bonded debt. This is exactly the result we should expect *à priori*, on many accounts. The amount which a railroad is able to collect from producers and shippers does not depend upon the amount of liabilities the directors may choose to incur. If the farmers' movement had taken place a few years ago, when Fisk and Gould were in control of the Erie road, and the agitators had thundered out such denunciations as we now hear against the iniquitous attempt of the directors to exact exorbitant rates for the purpose of declaring fraudulent dividends on the preferred and common stock, every one would have laughed at them. At that time, we heard nothing about the iniquities practised upon the farmer; it was then always the stockholder who seemed on the point of being ruined. There is something laughable in the notion of Thomas A. Scott, Cornelius Vanderbilt, or such men as are connected with the management of what are called the "Boston" roads, going every year into a calculation of how much they should raise freights in order to pay a profit on watered stock, because any one who knows anything about railroads knows that, so far from calculating their freight rates beforehand, the amount of income derived from freights from year to year is a highly changeable quantity, depending, particularly in new countries, on the movement of population and the growth of business.

The question, however, as to the true theory of freights we have no intention of discussing. All that we have any desire to prove here is that the relations assumed by the railroad moralists to exist between the stock of a railroad and its freight earnings are purely imaginary, a mere chimera. In the Ohio railroads, we have shown that the ratio between the two, so far from being fixed, ranges everywhere from five to seventy-five per cent.; and, by tracing the history of two or three "investment stocks" during the last few years, we see that the figures become wilder and wilder, and that, while both earnings and debt have been growing, they have moved on widely different lines, depending (as we may see in the case of the Erie road, whose history is better known than that of some others) on conditions of no small complexity. There is about as close a relation between the debt of a railroad and the amount it is able to earn from freight as there is between the density of population and the height to which a balloon can ascend.

There is also another thing which the examination of these figures makes painfully evident—that the denunciation of the railroads for their exorbitant freight charges has been made without the slightest reflection or study of the subject. The denunciation was founded on an assumption which the very briefest examination of railroad statistics would have exploded. The seers and prophets, however, among the farmers did not think it worth while to look into the matter at all. They knew that the debts of railroads were large and constantly increasing, and they had been told that railroads were monopolies, and monopolists could do exactly what they pleased. This was quite enough for them; and out of this slender stock of information they concocted the theory that the way these monopolists managed roads was to create a gigantic debt first, and then pay the interest on it by exacting what they chose from the farmers. One would suppose, from the theories which the farmers' friends have invented for them in the past six months, that they might have come out of the brain of some Confucian philosopher in the interior of Asia, so little relation have they to the actual life of the country. Railroads are public highways at one moment, private roads the next; the building of a great railroad from ocean to ocean is a work to fire patriotic hearts so long as it is unbuilt; as soon as it is built, it becomes an invention of the devil; and within six months we hear that a new railroad from ocean to ocean is the only thing that will extricate us from the meshes in which we have involved ourselves by building the first. A few years ago the curse of railroad management was that the directors swindled the stockholders, and now it is that they swindle the farmers in the interest of the stockholders. As soon as we hear of any plan of railroad reform that looks feasible, we shall support it; but we have as yet seen no evidence that the study of the subject by those who make so much noise about it, has been even begun.

THE MORAL SIDE OF PANICS.

OUTSIDE those who are actually engaged in a financial panic, such as brokers, bankers, merchants, and manufacturers, who have loans to pay or receive, or acceptances falling due, and who are therefore too busy and too sorely beset to moralize on it, or look at it objectively, as the philosophers say, there is a large body of persons who are not immediately affected by it, such as professional men, owners of secure investments, persons in receipt of well-assured salaries, ministers, newspaper writers, speculative economists, financiers, and farmers, to whom it is a source of secret enjoyment. They are obliged, out of sympathy with their neighbors, to look blue, and probably few of them are entirely exempt from the general anxiety about the future, but, nevertheless, they are on the whole rather gratified than otherwise by the thing's having happened. In the first place, all those persons who give their attention to the currency question are divided into two great schools—the paper men and the hard-money men; and every panic affords each of them what it considers a legitimate ground of triumph. The paper men say that the crisis is due to failure to issue more paper at the proper moment, and the hard-money men ascribe it to the irredeemability of what is already issued; and each side chuckles over the convulsion as a startling confirmation of its views, and goes about calling attention to it almost gleefully. There is a similar division on the banking question. Indeed, the feud between the friends of free banking and restricted banking is fiercer than that between the two currency schools, and has raged longer, and every monetary crisis feeds the flame. It is maintained, on the one hand, that if banks were let alone by the state, their issues would be proportioned to the exact wants of business; and, on the other, that if the state would only restrict them more rigidly, business would be kept within proper limits, and all would go well. Each disputant draws from a panic about the same amount of support for his views, because in the great variety of circumstances which surround it there are always some which favor any theory of its origin. In one thing, however, both sets of observers are apt to agree thoroughly, and that is in believing the "thing will not blow over," and that "we are going to feel it for a long time." They have long foreseen it, and

have only been surprised that it did not come sooner; and they lower their voices to a hoarse whisper while telling you this.

But there is no class of observers which extracts so much solid comfort from a panic as that large body of social philosophers who are hostile to luxury, and believe that the world is going to the dogs through self-indulgence. It may even be said that two-thirds of the community, or indeed all except the very few, hold this opinion with a greater or less degree of strength. The farmers hold it strongly with regard to the city people, the artisans with regard to merchants, bankers, brokers, and manufacturers, and among the latter nearly every man is inclined to it with regard to persons of more means than himself. Moreover, it would probably astonish us if we knew how large was the number of those who fancy that their more well-to-do neighbors, if they do not belong to the category of millionaires, are living beyond their means. Every man whose own means are small, or even moderate, finds himself rather hard put to it to make both ends meet, and is constantly harassed by desires which he is unable to gratify. When he sees others gratifying them, his self-love drives him often unconsciously into ascribing it to recklessness and improvidence. Very close people, too, who have a constitutional repugnance to spending money freely for any purpose, and especially for purposes of personal enjoyment, can hardly persuade themselves that other persons who do so spend it honestly. And then behind these come the large army of lovers of simplicity and frugality on moral and religious grounds, who believe that material luxury contains a snare for the soul, and that true happiness and real virtue are not to be found in gilded saloons, and who write to the newspapers denouncing the reluctance of young people to marry on small incomes, and urging girls to begin life as their mothers began it and despise the silly chatter of those who think the luxurious surroundings more important than the union of hearts.

The occurrence of a panic fills the breasts of all these with various degrees of rejoicing. They always take a very dark view of it, and laugh contemptuously at those who consider it a "Wall Street flurry," or ascribe it to any vice in the currency or in the banking system. Extravagant living they believe to be at the bottom of it, and, like the hard-money men, they are only surprised that it has not come sooner, and they believe most firmly that it is going to effect a sort of social revolution, and bring the world more nearly to their own ideal of what it ought to be. The amount of "rottenness" which they expect it to reveal is always enormous, and they look forward to the exposure and the general coming-down of their guilty neighbors to "the hard pan" with the keenest relish. They have long, for instance, been unable to imagine where the multitude of people who live in brown-stone houses got the money to keep them. There was something wrong about it, they felt satisfied, though they could not tell what, and when the panic comes, they half fancy that the murder will out, and that there will be a great migration of fraudulent bankrupts from Fifth Avenue and its neighborhood into tenement-houses on the East and North Rivers. How Mrs. Smith, too, dressed as she did, and where Smith got the money to take her to Sharon every summer, and how Jones managed to entertain as he was doing, have often been puzzling problems, which "the crash" in the money market is at last going to solve. It is also highly gratifying to those who consider yachting a senseless amusement to reflect that the panic will probably diminish the number of yachts, and they even flatter themselves that it may stop yachting in future, and reduce the general style of living among rich young men. "We shall now," they say, "have fewer fast horses, and less champagne, and less gaudy furniture, and more honest, hard work and plain, wholesome food." They accordingly rejoice in the panic as a means adopted by Providence to bring a gluttonous and ungodly generation to its senses, and lead it back to that state of things which is known as "republican simplicity."

The curious thing about this expectation is that it has survived innumerable disappointments without apparently losing any of its vigor. It was strong after 1837, and strong after 1857, and stronger than ever after 1861. The war was surely, people said, to bring back the golden age, when all the men were prudent, sober, and industrious, and all the women simple, modest, and home-keeping. The war did nothing of the kind; in fact, it left us more extravagant, and lavish, and self-indulgent than ever; and yet the ancient and tough belief in the purifying influence of a stringent money market still lasts, and is at this moment cropping out in the moral department of a thousand newspapers.

The belief belongs to what may be called the cataclysmal theory of progress, which improves the world by sudden starts, and clings so fondly to liquor-laws, and has profound faith in specific remedies for moral and political diseases. What commercial panics and great national misfortunes do not do, particular bits of legislation are sure to do. You put something in the Constitution, or forbid something, or lose a battle, or have a "shrinkage of values," or have a cholera season, and forthwith the community turns over a new leaf, and becomes moral, economical, and sober-minded. We doubt whether this theory will ever die out, however much philosophers may preach against it, or however often facts may refute it, because it gratifies or promises to gratify one of the deepest longings of the human heart—the desire which each man feels to have a great deal of history crowded into his own little day. None of us can bear to quit the scene without witnessing the solution of the problems by which his own life has been vexed or over which he has long labored. Indeed, a great many men would find it impossible to work with any zeal to bring about results which would probably not be witnessed until they had been centuries in the tomb, and we accordingly find that the most eager reformers are apt to be those who look for the triumph of virtue by the close of the current year. Of all dreams of eager reformers, however, there is probably none more substantial than that which looks for a restoration of that vague thing called "simplicity of manners." Simplicity and economy are, of course, relative terms. The luxurious gentleman in the fourteenth century lived in a way which the well-to-do artisan in our own time would not tolerate; and when we undertake to carry people back to ancient ways of living, we find that there is hardly a point short of barbarism at which we can consistently stop. A country in which money is easily made and abounds will be one in which money will always be freely spent, and in which personal comfort and even display will occupy men's thoughts and women's a great deal. We can no more prevent this than we can prevent the growth of wealth itself; and our duty is, instead of wasting our breath in denouncing extravagance, or hailing panics as purging fires, to do what in us lies to give rich people more taste, more conscience, more sense of responsibility for curable ills, and a keener relish of the higher forms of pleasure. Extravagance—or, in other words, the waste of money on sensual enjoyment, as the production of hideous furniture or jewelry, or of barbarous display—has to be checked, not by the preaching of poor people, but by the rich man's own superiority to these things, and his own repugnance for them; and this repugnance can only be inspired by education, whether that of school and college, or that of a refined and cultivated social atmosphere. Much would be done in this direction if public opinion exacted of the owners of large fortunes that they should give their sons the best education the country affords, or, in other words, send them to college, instead of setting them up in the dry-goods business or the grocery business. A man who has made a large fortune in honest trade or industry has done his share for the material interests of the country, and he cannot contribute his share to its moral and intellectual interests by merely making donations. It is his duty, also, if he leaves children behind him, to see to it, as far as he can, that they are men who will be an addition to the general culture and taste of the nation, and who will stimulate its nobler ambition, raise its intellectual standard, quicken its love of excellence in all fields, and deepen its faith in the value of things not seen.

AN EX-GRAND-DUCAL CAPITAL.

DARMSTADT, September 6.

SPENDING the summer just past at Homburg, I have been conscious of a sort of gentle chronic irritation, of a natural sympathy with the whole race of suppressed, diminished, and mutilated sovereigns, in my frequent visits to the great dispeopled Schloss, about whose huge and awkward hulk the red roofs of the little town, as seen from a distance, cluster with an air of feudal allegiance, and which stands there as a respectable makeweight to the hardly scantier mass of the florid, fresh-colored Kursaal. It was formerly the appointed residence of the Landgrafs of the very diminutive state of Hesse-Homburg, the compact circumference of which these modest potentates might have the satisfaction of viewing, any fine morning, without a telescope, from their dressing-room windows. It is something of course to be monarch of a realm which slopes away with the slope of the globe into climates which it requires an effort to believe in and are part of the regular stock of geography; but perhaps we are apt to underestimate the peculiar complacency of a sovereign to whose possessions the blue horizon makes a liberal margin, and shows him his cherished inheritance visibly safe and sound, unclipped, unmenaced, shining like a jewel on its velvet cushion. This modest pleasure the Landgrafs of Hesse-Homburg must have enjoyed in perfection; the chronicle of their state-progresses should be put upon the same shelf as Xavier de Maistre's 'Voyage autour de ma Chambre.' Though small, however, this rounded particle of sovereignty was still visible to the naked eye of diplomacy, and Herr von Bismarck, in 1866, swallowed it as smoothly as a gentleman following a tonic régime disposes of his homœopathic pellet. It had been merged shortly before in the neighboring empire of Hesse-Darmstadt, but promptly after Sadowa it was "ceded" to Prussia. Whoever is the loser, it has not been a certain lounging American on hot

afternoons. The gates of the Schloss are now wide open, and the great garden is public property, and much resorted to by old gentlemen who dust off the benches with bandannas before sitting down, and by sheepish soldiers with affectionate sweethearts. Picturesquely, the palace is all it should be—very huge, very bare, very ugly, with great clean courts, in which round-barrelled Mecklenburg coach-horses must often have stood waiting for their lord and master to rise from table. The gateways are adorned with hideous sculptures of about 1650, representing wigged warriors on corpulent chargers, twisted pillars, and scroll-work like the "flourishes" of a country writing-master—the whole glazed over with brilliant red paint. In the middle of the larger court stands an immense isolated round tower, painted white, and seen from all the country about. The gardens have very few flowers, and the sound of the rake nowadays is seldom heard on the gravel; but there are plenty of fine trees—some really stupendous poplars, untrimmed and spreading abroad like oaks, chestnuts which would make a figure in Italy, beeches which would be called "rather good" in England; plenty of nooks and bowers and densely-woven arcades, triumphs of old-fashioned gardenery; and a large dull-bosomed pond into which the unadorned castle-walls peep from above the trees. Such as it is, it is a place a small prince had rather keep than lose, and as I sat under the beeches—remembering that I was in the fatherland of ghost-stories—I used to fancy the warm twilight was pervaded by a thin spectral influence from this slender stream of empire, and that I could hear vague supernatural *Achs!* of regret among the bushes, and see the glimmer of broad-faced phantoms at the windows. One very hot Sunday the Emperor came, passed up the main street under several yards of red and white calico, and spent a couple of days at the Schloss. I don't know whether he saw any reproachful ghosts there, but he found, I believe, a rather scanty flesh-and-blood welcome in the town. The burgomasters measured off the proper number of festoons, and the innkeepers hung out their flags, but the townsfolk, who know their new master chiefly as the grim old wizard who has dried up the golden stream which used to flow so bounteously at the Kursaal, took an "outing" indeed, like good Germans, and stared sturdily at the show, but paid nothing for it in the way of hurrahs. The Emperor, meanwhile, rattled up and down the street in his light barouche, wearing under his white eyebrows and moustache the physiognomy of a personage quite competent to dispense with the approbation of ghosts and shopkeepers. "Homburg may have ceased to be Hessian, but evidently it is not yet Prussian," I said to a friend, and he hereupon reminded me that I was within a short distance of a more eloquent memento of the energy of Bismarck, and that I had better come over and take a look at the expiring Duchy of Darmstadt. I have followed his advice, and have been strolling about in quest of impressions. It is for the reader to say whether my impressions were worth a journey of an hour and a half.

I confess, to begin with, that they form no very terrible tale—that I saw none of the "prominent citizens" confined in chains, and no particular symptoms of the ravages of a brutal soldiery. Indeed, as you walk into the town through the grand, dull, silent street which leads from the railway station, you seem to perceive that the *genius loci* has never been frighted, like *Othello's* Cyprus, from its propriety. You behold it embodied in heroic bronze on the top of a huge red sandstone column, in the shape of the Grand-Duke Louis the First, who, though a very small potentate, surveys posterity from a most prodigious altitude. He was a father to his people, and some fifty years ago he "created" the *beaux quartiers* of Darmstadt, out of the midst of which his effigy rises, looking down upon the Trafalgar Square, the Place de la Concorde, of the locality. Behind him the fine, dull street pursues its course and pauses in front of the floride façade of the Schloss. This entrance into Darmstadt responds exactly to the fanciful tourist's preconceptions, and as soon as I looked up the melancholy vista, my imagination fell to rubbing its hands and to whispering that this indeed was the ghost of a little German court-city—a mouldering Modena or Ferrara of the North. I have never known a little court-city, having, by ill-luck, come into the world a day too late; but I like to think of them, to visit them in these blank, early years of their long historic sleep, and to try and guess what they must be dreaming of. They seem to murmur, as they snore everlastingly, of a very snug little social system—of gossiping whist-parties in wainscoted grand-ducal parlors, of susceptible aulic councillors and æsthetic canonesses, of emblazoned commanders-in-chief of five hundred warriors in periwigs, of blonde young hussars all gold-lace and billet-doux, of a miniature world of jealousies and intrigues, ceremonies and superstitions—an oppressively dull world, doubtless, to your fanciful tourist if he had been condemned to spend a month in it. But Darmstadt, obviously, was not dull to its own sense in the days before Bismarck, and doubtless the pith of its complaint of this terrible man is that he has made it so. All around Duke Louis's huge red pedestal rises a series of sober-faced palaces for the transaction of the affairs of this little empire. Before each of them is a striped red-and-white sentry-box, with a soldier in a spiked helmet mounting guard. These public offices all look highly respectable, but they have an air of sepulchral stillness. Here and there, doubtless, in their echoing chambers, is to be heard the scratching of the bureaucratic quill; but I imagine that neither the home nor the foreign affairs of Hesse-Darmstadt require nowadays an army of functionaries, and that if some grizzled old clerk were to give you an account of his avocations, they would bear a family likeness to those of Charles Lamb at the India House. There are half-a-dozen droshkys drawn up at the base of the monument, with the drivers sitting in the sun and wondering sleepily whether any one of the three persons in sight, up and down the street, will be likely to want a carriage. They wake up as I approach and look at me very hard; but they are phlegmatic German drivers, and they neither hail me with persuasive cries nor project their vehicles forcibly upon me, as would certainly be the case at Modena or Ferrara. But I pass along and ascend the street, and find something that is really very Ferrarese. The grand-ducal Schloss rises in an immense mass out of a great crooked square, which has a very pretty likeness to an Italian *piazza*. Some of the houses have Gothic gables, and these have thrifty shop-fronts and a general air of paint and varnish; but there is shabbiness enough, and sun, and space, and bad smells, and old women under colored umbrellas selling cabbages and plums, and several persons hanging about in a professional manner, and, in the midst of it all, the great moated palace, with soldiers hanging over the parapets of the little bridges, and the inner courts used as a public thoroughfare. On one side, behind the shabby Gothic gables, is huddled that elderly Darmstadt to which Duke Louis affixed the modern mask of which his own effigy is the most eminent feature. A mask of some sort old Darmstadt most certainly needs, and it were well if it might have been one of those glass covers which in Germany are deposited over too savory dishes. The little crooked, gabled streets presume quite too audaciously on uncleanness being an element of the picturesque. The gutters stroll along with their hands in their pockets, as it were, and pause in great pools before crossings and dark archways to embrace their tributary streams, till the odorous murmur of their confluence quite smothers the voice of legend. There is dirtiness and dirtiness. Sometimes, picturesquely, it is very much to the point; but the American traveller in Germany will generally prefer not to enjoy local color in this particular form, for it unfavorably reminds him of the most sordid, the most squalid prose he knows—the corner-groceries and the region of the docks in his native metropolis.

The Schloss, however, is picturesque without abatement, and it seems to me a great pity there should not be some such monumental edifice in the middle of every town, to personify the municipal soul, as it were, to itself. If it can be beautiful, so much the better; but the Schloss at Darmstadt is ugly enough, and yet—to the eye—it amply serves its purpose. The two façades toward the square date from the middle of the last century, and are characteristically dreary and solemn, but they hide a great rambling structure of a quainter time: irregular courts, archways bearing away into darkness, a queer, great yellow bell-tower dating from the sixteenth century, a pile of multitudinous windows, roofs, and chimneys. Seen from the adjacent park, all this masses itself up into the semblance of a fantastic citadel. One rarely finds a citadel with a handsomer moat. The moat at Darmstadt yawns down out of the market-place into a deep verdurous gulf, with sloping banks of turf, on which tame shrubs are planted and mingled with the wild ones lodged in the stout foundations. It forms, indeed, below the level of the street, a charming little belt of grass and flowers. The Schloss possesses, moreover, as it properly should, a gallery of pictures, to which I proceeded to seek admission. I reflected, on my way, that it is of the first importance, picturesquely speaking, that the big building which, as I just intimated, should resume to its own sense the civic individuality of every substantial town, should always have a company of soldiers lounging under its portal and grouped about the guard-room. A green moat, a great archway, a guard-room opening out of its shadow, a couple of pacing sentinels, a group of loafing musketeers, a glimpse on one side of a sunny market-place, on the other of a dusky court—combine the objects as you may, they make a picture; they seem for the moment, as you pass, and pause, and glance, to transport you into legend. Of course the straddling men-at-arms who helped to render me this service were wearers of the spiked helmet. The Grand-Duke of Hesse-Darmstadt still occupies the Schloss, and enjoys a nominal authority. I don't know on what terms he holds it, nor what are the emotions of the grand-ducal breast when he sees a row of these peculiarly uncompromising little head-pieces bristling and twinkling under his windows. It can hardly be balm to his resentment to know that they sometimes conceal the flaxen pates of his own hereditary Hessians. The spiked helmets, of course, salute rigorously when this very limited monarch passes in and out; but I sometimes think it fortunate, under these circumstances, that the average German countenance has not a turn for ironical expression. The Duke, indeed,

in susceptible moods, might take an airing in his own palace without driving abroad at all. There are apparently no end to its corridors and staircases, and I found it a long journey to the picture-gallery. I spent half an hour, to begin with, in the library, waiting till the custodian was at liberty to attend to me. The half-hour, however, was not lost, as I was entertained by a very polite librarian, with a green shade over his eyes, and as I filled my lungs, moreover, with what I was in the humor to call the atmosphere of German science. It was a very warm day, but the windows were tight-closed, in the manner of the country, and had been closed, presumably, since the days of Louis the First. The air was as dry as iron filings; it smelt of old bindings, of the insides of old books; it tasted of dust and snuff. Here and there a Herr Professor, walled in with circumjacent authorities, was burying his nose in a folio; the grey light seemed to add a coating of dust to the tiers of long, brown shelves. I came away with a headache, and that exalted esteem for the German brain, as a mere working organ, which invariably ensues upon my observation of the physical conditions of German life. I don't know that I received any very distinct impression from the picture-gallery beyond that of there being such and such a number of acres more of mouldering brush-work in the world. It was a good deal like the library, terribly close, and lined for room after room (it is a long series) with tiers of dusky brown canvases, on which the light of the unwashed windows seemed to turn sallow and joyless. There are a great many fine names on the frames, but they rarely correspond to anything very fine within them, though, indeed, there are several specimens of the early German school which are quite welcome (to my mind) to their assumed "originality." Early or late, German art rarely seems to me a happy adventure. Two or three of the rooms were filled with large examples of the modern German landscape school, before which I lingered, but not for the pleasure of it. I was reflecting that the burden of French philosophy just now is the dogma that the Germans are a race of *faux bonshommes;* that their transcendental æsthetics are a mere kicking up of dust to cover their picking and stealing; and that their frank-souled naïveté is no better than a sharper's "alias." I don't pretend to weigh the charge in a general sense, but I certainly think that a good French patriot, in my place, would have cried out that he had caught the hypocrites in the act. These blooming views of Switzerland and Italy seemed to me the most dishonest things in the world, and I was puzzled to understand how so very innocent an affair as a landscape in oils could be made such a vehicle of offence. These were extremely clever; the art of shuffling away trouble has rarely been brought to greater perfection. It is evidently an elaborate system; there is a school; the pictures were all from different hands, and the precious receipt had been passed round the circle.

But why should I talk of bad pictures since I brought away from Darmstadt the memory of one of the best in the world? It forms the sole art-treasure of the place, and I duly went in quest of it; but I kept it in reserve as one keeps the best things, and meanwhile I strolled in the Herrengarten. The fondness of Germans for a garden, wherever a garden can be conceived, is one of their most amiable characteristics, and I should be curious to know how large a section of the total soil of the fatherland is laid out in rusty lawns and gravel-paths, and adorned with beechen groves and bowers. The garden-hours of one's life, as I may say, are not the least agreeable, and there are more garden-hours in German lives than in most others. But I shall not describe my garden-hour at Darmstadt. Part of them was spent in walking around the theatre, which stands close beside the Schloss, with its face upon the square and its back among the lawns and bowers. The theatre, in the little court-city of my regrets, is quite an affair of state, and the manager second only in importance to the prime-minister or the commander-in-chief. Or rather the Grand Duke is manager himself, and the leading actress, as a matter of course, his morganatic wife. The present Grand-Duke of Hesse-Darmstadt, I believe, is a zealous patron of the drama, and maintains a troupe of comedians, who doubtless do much to temper the dulness of his capital. The present theatre is simply a picturesque ruin, having been lately burned down, for all the world like an American "opera-house." But the actors have found a provisional refuge, and I have just been presented with the programme of the opening night of the winter season. I saw the rest of Darmstadt as I took my way to the palace of Prince Karl. It was a very quiet pilgrimage, and I perhaps met three people in the long, dull, proper street through which it led me. One of them was a sentinel with a spiked helmet marching before the snug little palace of the Prince Louis—the gentleman who lately married the Princess Alice of England. Another was a school-boy in spectacles, nursing a green bag full of polyglot exercises, I suppose, of whom I asked my way; and the third was the sturdy little musketeer who was trying to impart a *reflet* of authority to the neat little white house occupied by the Prince Karl. But this frowning soldier is no proper symbol of the kindly custom of the house. I was admitted unconditionally, ushered into the little drawing-room, and allowed half an hour's undisturbed contemplation of the beautiful Holbein—the famous picture of the Meyer family. The reader interested in such matters may remember the discussion maintained two years since, at the time of the general exhibition of the younger Holbein's works in Dresden, as to the respective merits—and I believe the presumptive priority in date—of this Darmstadt picture and the presentation of the same theme which adorns the Dresden Gallery. I forget how the question was settled—whether, indeed, it was settled at all, and I have never seen the Dresden picture; but it seems to me that if I were to choose a Holbein, this one would content me. It represents a sort of plainly-lovely Virgin holding her child, crowned with a kind of gorgeous episcopal crown, and worshipped by six kneeling figures—the worthy Goodman Meyer, his wife, and their progenitors. It is a wonderfully solid masterpiece, and so full of wholesome human substance that I should think its owner could go about his daily work the better—eat and drink and sleep and perform the various functions of life more largely and smoothly—for having it constantly before his eyes. I was not disappointed, and I may now confess that my errand at Darmstadt had been much more to see the *Holbeinische Gemälde* than to examine the trail of the serpent—the footprints of Bismarck.

Notes.

J. B. LIPPINCOTT & CO. have in press 'Wontus, or the Corps of Observation,' by Col. Wm. Runkel; 'The Works of Sheridan,' printed in large type, with a memoir by James P. Browne, M.D.; 'Pen Pictures of Europe,' by Elizabeth Peake, with numerous illustrations; 'Our British Portrait Painters, 1617 to 1872,' consisting of sixteen engravings on steel, with descriptive and historical notices by Edmund Ollier; and 'Pictures by Clarkson Stanfield, R.A.,' with descriptions and a biographical sketch by James Daffarne.——*Nature* of Sept. 18 begins a series of biographical sketches of eminent men of science, accompanied with portraits on steel, Faraday being the subject of the first, and the likeness of him being excellent.

—A ceremony highly characteristic of New England life took place last week in the pleasant town of Concord, the town where, according to Professor Agassiz, who was not contradicted by any of the citizens, "people live in a manner that is felt all over the country." The ceremony was the formal reception by the town of a handsome library building presented to his fellow-citizens by Mr. William Munroe. Among the gentlemen present were Mr. R. W. Emerson, Judge Hoar, Mr. George Hoar, M.C., Senator Sumner, and other persons of prominence. Brief speeches were made by several of them, Mr. Emerson speaking longest, but not long. Mr. Frederick Hudson gave a few facts about the Concord libraries; that in 1786 a library company was formed; that in 1805 there was a Concord Library of 250 books, which, in 1830, was supplemented by a Social Library of 800 books, and this again by a Town Library, like that enriching so many Massachusetts towns, and which on the day of the ceremonies contained 10,000 books. These the town authorities made over to the Trustees of the new library, which by the first of January will contain in all eleven thousand books—probably four books to each inhabitant, without counting private collections. It will also contain what few New England libraries can show, that is, original manuscripts by celebrated authors, of whom some of the most celebrated were among its own village residents. These papers were the gift of Mr. James T. Fields, and comprise autograph copies of Emerson's chapter on 'Culture,' Thoreau's on 'Walking,' Lowell's 'Cathedral,' Holmes's 'Dorothy L.,' one of the best of that gentleman's works, and Mr. Motley's 'Address before the Parker Fraternity in 1868.' Nothing of Hawthorne's was among the manuscripts. Mr. Emerson, in making his remarks, was conversational but not desultory, for books were his theme throughout. He referred to the bookish sources of culture which the inhabitants of Concord had from the beginning had within their reach. Of these the minister's library was one; the school, founded so long ago as 1680, another; another, of course, the quality of the inhabitants who settled there. From a book written by Concord's first minister, Peter Buckley, Mr. Emerson quoted a passage worthy to be remembered: "There is no people but will strive to excel in something. What can we excel in except in holiness? If we look to numbers, we are the fewest; if we look to strength, we are the weakest; if to riches, we are the poorest of the people of God over the whole world. We cannot excel or so much as equal people in these things, and if we come short in grace and holiness too, we are the most despicable people under heaven. Strive ye therefore herein to excel, and suffer not this crown to be taken away from you." From the learned John Selden Mr. Emerson quoted with approval the saying, that "the man who strives to make himself a different thing from other men by much reading

gains this, his chiefest good, that among all fortunes he has something to comfort himself withal." Montesquieu also was cited in laudation of books; and Napoleon, Kepler, a Shaker whom Mr. Emerson once met, a lady whose journal he had read, the great Duke of Marlborough, Mohammed, and Dr. Johnson, appear in the curious juxtaposition in which the great and small of various countries and ages are not unusually seen in Mr. Emerson's writings.

—A writer in the Hartford *Courant* has recently been examining the Connecticut colonial records covering a period from May, 1726, to May, 1735, and some of the things which struck his attention are interesting and suggestive. Thus, the Assembly which met at Hartford in 1726 is believed to have afforded one of the earliest known examples of our American system of legislative "deadheading," for to a Hartford man who held the franchise of the ferry it granted leave to sell spirituous liquors aboard his boat, on the condition that to persons in the public service he should remit all charges. Tobacco in those days was probably less in favor in the Connecticut Valley than it is at present, for an ordinance of this same Assembly provides that "if any member shall presume to smoak tobacco in the chamber wherein they now commonly sit, at any time whatsoever, he shall pay a fine of 6d. for each offence." The Hartford paper, mindful that this month the question is to be settled whether New Haven shall continue to share with Hartford the honor of being the seat of government, requests attention to the utter recklessness of the old Assemblies when they met at New Haven. Meeting at Hartford in August, 1727, to receive news of the death of King George I. and the accession of King George II., the council ordered that the regiment of Hartford, Windsor, and Wethersfield be turned out in the afternoon, that each soldier be allowed half a pound of powder to burn on the occasion, and that in the evening there should be illuminations, they being "much more honorable signals of joy" than bonfires, which were forbidden. But afterwards, in October, when the Assembly met at New Haven, King George II. had to be proclaimed over again, and it is on this occasion that the Hartford man notices the extravagance which appears to be inherent in the New Haven atmosphere. At this second proclamation the Assembly economize on the powder, indeed, for they cut down the allowance to a quarter of a pound a man; but they order the sheriff to procure, at the charge of the colony, ten pounds of candles with which to illuminate the court-house, and furthermore to procure one barrel of good wine, also at the charge of the colony, and to have the same in the court-house against the time of the illumination, the said wine to be for the refreshment of the Assembly. At this time, or somewhat later (1730), as is to be learned from an appendix to the seventh volume of the Connecticut Colonial Records, the Board of Trade puts various queries to town officers (?) and other persons, and receives much useful information. Thus there were then in the colony 38,000 citizens, about 700 Indian and negro slaves, and 1,600 free Indians, who made mischief by reason of their idleness and their excessive drinking of "rhum." The colony had a small army of militia, which included every male inhabitant between 16 years old and 55, and numbered 8,500 men. The French in Canada might have to be fought, for they had made themselves very troublesome, "and since they are settled on the River Saint Lawrence and on the Masasipi to the mouth of it, boast that in time they will drive us all into the sea." As for the Spaniard, he "has not settled in North America to the eastward of Cape Florida, as we know of, which is very distant from us." There is one item, says the *Courant*, which should not be overlooked: the total annual revenue was £4,000, and of this sum £1,000 was expended in supporting schools—a fact which goes some way towards explaining the present ownership of the Masasipi.

—The first half of Fuseli's sentence on Northcote—that he was an angel at an ass, and an ass at an angel—will be thought by many to be praise none too high for the distinguished animal painter whose decease marked the beginning of the month. Yet it would certainly have been a pity if Landseer had created a school, or left an enduring impress upon the zoölogical department of his country's, or any country's, fine arts. What he knew about the feelings, intelligence, and moral powers of animals he was never content to state simply, but would hasten to lose sight of it in an ill-judged exaggeration. It might have been in his power, with his opportunities and tastes, to have added something to what is known about the limits and expression of instinct. Landseer worked in a coarser way: he chose such human emotions as might be cleverly represented in the persons of animals, and painted his quadrupeds in illustration of those emotions. His most applauded figures are more like men degraded to animals, than like animals who have approached, in the direct line of character, nearest to the manners of men. He represents a dog as a judge, or an attorney, or a butcher, or as the negro slave Uncle Tom. This sort of ingenuity is amusing enough in Grandville's drawings of *animals painted by themselves;* but only a mind of a certain commonness, we take it, would care to express it in elaborate oil compositions. Decamps, it is true, has left some painted grotesques of monkeys exercising human functions; but they are kept within the proper limits of *fantaisies*, and are, besides, endowed with light graces of color and effect that are wanting to Landseer's style. The latter's learned-dog exhibitions, where we are surprised not to meet the red coat and cap and feather of the canine theatre, have entered into a great number of our houses—thanks to the engravings, in a fine, showy style, by the artist's brother, Thomas Landseer. The paintings, which do not contain the merit suggested by the plates, are accumulated at Manchester in great numbers. It was Landseer's solid way of insisting on his pleasantries, his habit of making great historical pictures out of designs seemingly meant for *Punch*, that struck the Continentals when he broke his insular reserve and entered into European competition at Paris in 1855. "The somewhat exaggerated nicety of drawing," then said About, "the crudity of the color, an indescribable rigidity in the manner, and especially the entire absence of unpremeditated candor (*manque de naïveté*), give this work less charm than it merits, and make it amuse the eyes without satisfying the taste." Twin companion with Landseer's humor was his sentiment, an attribution of human consciousness to quadrupeds. His emotional animals are set arbitrarily in the scene just where one expects the human subject to be; if he gave his weeping dogs handkerchiefs and hatbands, he could hardly express their theatrical character more plainly. As if to show how coarse a trick, and how cheaply played, was this super-sensitiveness of Landseer's animals, when he came to have to do, in the Trafalgar Square bronzes, with brute forms that might properly have been elevated, in some symbolical and patriotic sense, beyond the proper consciousness of the beast, he subsided at once, and endowed his lions with the true lamblike unobtrusiveness seen in the menagerie. Sir Edwin was an artist of culture, having gone deeply into comparative anatomy in early life, at the instigation of Haydon. He could paint the figure and portrait creditably; his *Titania* is a good model of a stout, serviceable English girl. He was in immense request for sporting portraits and scenes of the hunt, his first great specimen in this line being an equestrian piece introducing the Duchess of Bedford, with a success which had a marked effect on the painter's career. His baronetcy came in 1850; he received at Paris, in 1855, one of ten medals of honor instituted for exceptional merit. His death, at the age of seventy-two, was preceded by a gradual eclipse of the faculties, extending back over several years. He died unmarried.

—M. de Candolle is not the only European naturalist who believes that English will eventually become the common scientific language of the world. Dr. T. Thorell, Professor of Zoölogy in the University of Upsala, who, though a native of Sweden, has lately published a work in English ('Remarks on Synonyms of European Spiders'), also holds this opinion, not only because English "is far more widely diffused over every part of the earth than any other culture-language, and that already two of the greatest nations publish in it the results of their scientific labors, but because English, on account of its simple grammar, and as combining in nearly the same degree Teutonic and Roman elements, is by most Europeans more easily acquired than any other language." Dr. Thorell is even so radical as to propose to deny to the authors of works written in little-understood languages, like the Slavic, the credit of priority in scientific description or discovery. It is, of course, quite improbable that any such conspiracy as this should ever be entered into by the savans of Western Europe. Against it there is the obvious consideration that, in every case of disputed priority, the chances of the French, German, or English scientist's getting the ear of posterity and monopolizing its monuments are vastly greater than those (say) of the Bohemian or the Magyar, not to speak of the enjoyment of the fame of his discovery during his own lifetime. Moreover, it ill accords with the catholicity of science to impose a penalty on the accident of birth, and science might easily be the loser, as Dr. Thorell's reviewer in *Nature* points out, by compelling any one who prefers to write in the tongue in which he can think most clearly and best express his thoughts, to abandon the vernacular for a foreign medium of communication with the scientific world.

—The war with France had the usual effect in Prussia of increasing the emigration to foreign countries. It was so a hundred years ago, it was so after Sadowa. In the period 1860-65, but little more than 1.4 per cent. of the population emigrated; in the next six years, however, 3.7 per cent. (66,064 persons). In 1872, Prussia lost 64,511 inhabitants, of whom about one-sixth were liable to military duty. For this and other obvious reasons the Government has taken alarm, and has resorted to such repressive measures as withdrawing the reduced fares previously allowed to emigrants carried over railroads belonging to the state, and prohibiting any but Prussian citizens from acting as emigration agents. Meantime, Herr Bödiker, of the Royal Statistical Bureau, has published a survey of Prussian emigration for

the twenty-seven years 1844–71, which shows the total number of emigrants to have been at least 641,657. The true number is undoubtedly greater, owing to the fact of the general neglect nowadays to inform the authorities by taking out emigration papers (*Entlassungsurkunden*). Ten years ago, not a quarter part of the emigrants left their native land without these documents; now not one-half take the trouble to ask for them. The immigration statistics of the United States on the one hand, and of Prussia on the other, and the difference between the births and deaths in the latter country, furnish a means of controlling the official records of emigration, and make it certain that they fall short of the reality. The bulk of the emigration has been from the six eastern provinces, they having lost 322,464, against 209,347 from the two western, and 109,846 from the three newly acquired provinces. A remarkably heavy emigration has taken place since 1867 from Schleswig-Holstein, Hanover, and Hesse-Nassau—provinces having but 18 per cent. of the total population of the state, yet having sent out nearly half of the emigrants (44.3 per cent.) from 1867 to 1871. In the years 1862–1871, about 60 per cent. of all the emigrants were males; heads of families and single persons constituted 50 per cent.; and generally it appears that emigration takes place chiefly by whole families. Three-fourths nearly were adults, and if this ratio can be applied to the emigration since 1844, then Prussia has certainly lost over 300,000, and probably 400,000, citizens, capable of bearing arms, and all Germany 1,000,000. Moreover, in the years 1870–1871, those liable to military service formed one-fifth of all the Prussian emigrants. The assurance of peace which the Empire is now giving to Europe is shown in the fact that whereas in the last six months of 1872 the German immigration at the port of New York amounted to 78,385 persons, it fell off in the first six months of 1873 to 67,334.

—Some months ago the *World* printed a report of an "interview" with Prince Bismarck, which represented him as making such extraordinary statements as that his political activity had been and would be directed towards annihilating the idea of God, substituting for religion the idea of devotion to the state, and overthrowing Christianity by attacking the Pope and the Jesuits. There were two ways of accounting reasonably for the appearance of this mass of nonsense: we could suppose that the *World's* correspondent was engaged in hoaxing his readers, or we could suppose that Jesuitism had instigated the publication. This latter conjecture may appear too ridiculous; but Prince Bismarck, in reply to a German gentleman of this city, who asked him if he had ever avowed sentiments so nefarious, says that the phrase about "crushing Rome in order to crush Christianity shows plainly the source and purpose of the calumny." And we may add that, despite the Prince's denial and the *World's* expressions of regret, there is a Roman Catholic journal of this city which still actually persists in believing and saying that Bismarck did say what he now chooses to disavow, and that the crushing of Christianity is really his policy. To believe this is next door to inventing it, and we may readily imagine a German Catholic, down in the heat of the battle, to have made the crazy tale out of whole cloth. A barefaced invention Bismarck calls it; and it was one almost everywhere scouted as too wildly ill-invented to answer any purpose whatever. The *World*, however—which has had some very remarkable foreign correspondents in several of the European capitals, Paris and London included—professed confidence in its correspondent at Berlin down to a few days ago. It now promises that, if deceived again, that gentleman at least shall not be the deceiver.

—Dr. Henry Schliemann, whose excavations in the neighborhood of ancient Troy have been so liberally rewarded with precious discoveries, is now engaged in publishing a narrative of his three years' labors, to be accompanied by a quarto atlas containing 213 photographs, representing more than 3,600 of the more than 100,000 alleged Trojan relics secured by him; containing also six plans constructed by engineers, which will, we suppose, indicate the extent and laying out of the three cities revealed by his digging on the same site. Having finished his undertaking in this quarter, and being desirous of making similar excavations (always at his own expense) in Greece, particularly on the sites of Mycenæ and Olympia, he made a proposition to the Greek Government by which he should be permitted to retain possession of the objects found as long as he lived, in return for his building a palace in Athens expressly for their preservation, to be called the Schliemann Museum, and to become the property of the nation with all its contents after his death. A more liberal offer could scarcely have been devised, and it was accepted by vote of Parliament, but "pocketed" by the Government; and Schliemann, with less than the Sibyl's pertinacity, renounced at once and for ever the thought of making excavations in Greece, and transferred his offer, *mutatis mutandis*, to the Italian Government, from whom it met with a very cordial reception, and Magna Græcia was suggested as the most promising field of operations. Dr. Schliemann has indicated his preference for Palermo or Naples as the seat of his future Museum.

—The stuff of which "pilgrims" are made in these days may be gathered from the perusal of some of the "pious books" which have been widely circulated in France. One is by a certain Abbé Gaume, is published with the approval of Rome, and in the course of two years has passed through more than twenty editions. It is a catechism designed for adults, and teaches, among other things (to the everlasting confusion of the solar myth), that the sun, the moon, and the stars were created after the light, in order that they might not become objects of worship, and that one of God's reasons for making the sea was to enable missionaries by means of it to visit foreign parts. The same author has written another work in which Protestants, infidels, Jews, Mohammedans, savages, and cannibals are classed under one head with bears, dogs, crocodiles, etc., leaving the true Catholics apart by themselves, with no middle ground between these two categories. A third edifying specimen of pilgrim literature is the Reverend Father Huguet's 'Les Faits surnaturels de la vie de Pie IX.,' which in 1871 had quickly reached a fourth edition. The French reader is here assured that the miracles actually performed by the present Pope are innumerable, consisting mainly, however, of conversions and cures. His longevity is explained by the fact that many monks and nuns have vowed their own lives to prolong his, death generally ensuing with commendable celerity upon the completion of the vow. His power over those who despise his sacred person, even at a distance, is illustrated by the case of a resident of Francavilla, in the province of Lecce, who maliciously named his dog Pius IX. One July day this reprobate was amusing himself with making the animal stand up against the wall like a soldier, taking his name in vain, and otherwise mocking the venerable pontiff, when the dog, "as if indignant at such insolence," sprang at his master's throat, threw him down, and, when driven away by the family, left him bathed in blood, to die shortly, deprived of the consolations of religion.

THE RENAISSANCE.*

MR. PATER, in a book which on the whole deserves the epithet fascinating, shows a power of expression and a subtlety of analysis which at first reading disposed us to admit him to a place among the best critics; but when we return to study out the meaning unfolded and measure our acquisitions, we find we must change the word. Much is enfolded and much is told that is admirable in telling, but not so much of the theme as of Mr. Pater himself; of him we obtain a very distinct and pleasing notion in general, but of his nominal subject we hardly know more than before we read his 'Studies.' The author is too much of an artist to be a good critic, and hardly attempts to disguise the fact that he is more interested in the perfection of his own style than in the mysteries of the art on which his studies are based. In fact, he sets out with a fallacy which shows clearly enough that "diletto" rather than "cognosco" is the root of his thinking. "Such discussions [on beauty in the abstract, etc.] help us very little to enjoy what has been well done in art or poetry, to discriminate between what is more and what is less excellent in them, or to use words like beauty, excellence, art, or poetry with more meaning than they would otherwise have. Beauty, like all other qualities presented to human experience, is relative, and the definition of it becomes unmeaning and useless in proportion to its abstractness. To define beauty, not in the most abstract, but in the most concrete terms possible, not to find a universal formula for it, but the formula which expresses most adequately this or that special manifestation of it, is the aim of the true student of æsthetics." And having thus broadly stated his creed, which is that of most dilettanti, viz., that there is no standard, that there are no fundamental principles in art, but simply recognitions of personal sympathies and expressions of personal delights, he goes on to define with a logic not so successful as his rhetoric what the æsthetic critic has to do with.

The simple fact is that for want of definitions, formulas, abstract terms, and all those precise and "metaphysical" distinctions which our author holds in defiance, if not in abhorrence, the criticism of art is all afloat—is in effect nothing but the unreasoning and generally unreasonable expression of individual preferences or tastes, which may to-day be adopted as the standard from the personal prestige of the holder and to-morrow be rejected because another has supplanted him; and in this field he is king who has most power of persuasion, not he who has most reason. The habitual critic is simply a dilettante with more or less experience of art, with a set of rules which are pure assumption, and which contribute in no degree to establish taste on a sounder basis. What is wanted to render criticism a science and make even dilettantism certain and progressive, is a thorough nomenclature of art and definition of all its qualities in the abstract; and a declaration that any such attainments are either hopeless or

* 'Studies in the History of the Renaissance. By Walter H. Pater.' London and New York: Macmillan & Co.

useless, or in any degree inapplicable, is a confession of individual incapacity to attain to or make use of them.

To assert that art and beauty have not laws capable of rigid definition, and as rigid application to all cases which can ever come under them, is equivalent to asserting that there is no such thing as beauty, and that art is whatever any one chooses to call it. Art, speaking in the distinctive sense of that term in which it is used when considered in reference to the expression of an ideal, is purely and only the metrical, rhythmical, harmonic (what the Greeks termed musical, pertaining to any of the Muses), or concordant expression of emotion, whether it be in poetry, painting, music, dancing, or any other conceivable way of opening the soul to influences above and beyond it; and to say that any of the arts thereby evolved is incapable of as absolute analysis and as abstract definition as music or color, is to confess a voluntary and factitious limit to the powers of the human intellect. The arts are but different forms of the same thing, and the analogies are so absolute and coherent that to have analyzed one is to have shown the way to analyze the whole.

It is true that in the moment of the enjoyment of any art-expression the analysis is, if not impossible, at least destructive of the completeness of the enjoyment, except to highly trained and peculiarly fitted minds; and the recognition of this half-truth is what Mr. Pater, like almost all dilettante critics, means by his statement. The absolute definition and embodiment in laws (not rules) of the principles which lie at the root of art is not only possible, but as indispensable to its complete and final development as the laws which govern the heavenly bodies are to the calculation of eclipses. It does not follow that art can be evoked by knowledge or application of rules, but that it cannot be fully understood and most effectively cultivated without that knowledge and application.

Mr. Pater takes with the word *renaissance* a liberty which, though very common, is historically and logically inadmissible. The word does not mean a revival, but a new birth, and was applied to a phase of art which its votaries believed to be the re-creation of Greek art. Its proper and technical meaning is in the resumption of classical *forms* of art-expression, as seen in Raphael's later work, Michael Angelo, and the indefinite horde who followed, amongst whom we notice most commonly Poussin, etc., etc.—an art which, far from being a new birth or even a revival, was, in its substitution of the borrowed and imitated themes which it effected, in reality the decay of art—that inevitable decay which accompanies the substitution of a reflected and imitative enthusiasm for genuine emotions which compel their own rhythmical expression and develop their own forms. If the term "renaissance" is in any way applicable to Italian art, it belongs to Giotto, who first went frankly to the original springs of art, the pure beauty of nature; but it is very doubtful if there was ever any suspense or renaissance in art, since when it subsided in one form it broke out in another, and the spirit was always the same, and immortal. A peculiar national temperament develops one form; change the nature of its emotions and the form of the art changes; but so long as there is genuine and lofty emotion, there will be art, be there schools or no schools. Nature is herself the great mistress—not, as the German critics have it, external and material nature, but the universal human-divine nature, in which are born and nourished every aspiration and emotion the embodiment of which becomes art.

The 'Studies' have the coherence which might be expected from separate essays on kindred topics, but written without any central thought; they are full of thought and suggestion, and abound in evidence of culture and accomplishment, but they must be taken not as a book, but each on its distinct merits. The last on Winckelmann is perhaps one of the completest expressions of the dilettante view of that celebrated art-writer which we can expect to have. It takes Winckelmann's side of Winckelmann, who was an art-critic in the sense that German painters are idealists when they *try* to be ideal, who confounded artifice with art, the form of things with their substance, and, like all worshippers of the renaissance, died in the worship of form and accident, not of substance and law. He was a narrow-minded man, whose nature was only open to reflected (and hence artificial) emotions, and the rigid forms of Greek art appealed to his narrow side—the nature which was the source of Greek art he had no eye for. He sought for the secret of the perfection of that art in a hypothetical and visionary physical perfection amongst the Greeks instead of where it really was, in the serene and exalted character of the Greek intellect, healthy and happy, full of sublime passions, with a remarkable freedom from sensuality, with a tranquil faith, and lives singularly free from what we may call worldly ambitions. If the whole known *répertoire* of Greek sculpture were alive and walking amongst us to-day, we should no more develop great sculptors than we do, because the temper in which that was conceived and born does not exist in modern times. This Winckelmann and his followers do not comprehend; they do not see that all the copying and imitation of antique statues which doomsday will permit will no more make an artist than the study of Greek hexameters will make another Homer. Art that looks back ceases to be art, and becomes artifice; a renaissance that is the renewal of dead forms is not a new birth, it is a galvanic resuscitation; and the modern sympathy (like Winckelmann's) with the Renaissance so-called, is but a morbid abhorrence of life and health, and fondness for death and artifice.

But we must not leave Mr. Pater with our differences alone adjusted. Differ in opinion with him we must, and continually, yet with profound respect for his opinion. The essay on "Pico Della Mirandola" is so full of genuine appreciation, so complete, so comprehensive, that, without having previous knowledge of Mirandola, one feels that, if living, he would say that Mr. Pater has told him better than he could have told himself. And generally the essays on literary themes are better than those on artistic (using the word in its narrow, common sense), for the simple reason that without being to a certain extent an artist it is absolutely impossible to be a comprehensive critic of art. In poetry, Mr. Pater is one of the cognoscenti; in painting, as we have said, only a dilettante. His conception of literary qualities seems clear and definite, but that of pictorial character evasive and indefinite, like a picture drawn by an untrained talent, with a vague, unincisive touch. But in whichever theme, his power, individuality, and charm of style are such as to make his book one of the best acquisitions which art-literature has made of late.

TRENCH'S PLUTARCH.*

AUTHORS have their ups and their downs, their ins and outs of fashion. We see this tendency conspicuously exemplified in Plutarch. After enjoying a high reputation for ages, he was unceremoniously cast down from his pride of place during the present century, and there now seems to be a chance of his restoration. It would not be fair to assign such changes of public favor wholly to caprice or to the sentiment of reaction, though both these may have their share in producing the result. The principal cause of these shifts and currents in the *aura popularis* we take to be that the subjects which an author treats are of more or less importance at different epochs. Thus, the early fathers of the church had been well-nigh consigned to oblivion by Protestants when, in the fourth decade of this century, the English Tractarian movement brought them into notice again. About the same time, Plutarch was temporarily shelved by the influence of that sceptic and iconoclastic school of history which, if it did not originate, at least had its first fair start with Niebuhr. The famous biographer was inaccurate, and gossipy, and a copyist, "no authority" on matters of fact—that settled him. But another twenty years passed, and the bold speculations of Mill, Buckle, and others aroused a lively interest in the history of ethics. And thus Plutarch reappears, though in a somewhat different capacity, more as the moralist than as the biographer.

Some two years ago, when speaking of the Boston edition of the 'Morals,' we noticed the vigorous rally of heathen morality in Plutarch's day, and the striking circumstance that it seemed entirely independent of Christianity. Plutarch himself is a perfect specimen of this independence. Not only is there not, in all his voluminous writings, any direct mention of our faith, but there is scarcely a passage from which the cleverest ingenuity can extract a possible allusion. Now, here the question naturally occurs: Was the silence of the philosophers founded on *bona-fide* ignorance, or did they, like the Jew Josephus, purposely ignore what was too great a puzzle for them? It would be absurd to suppose Josephus ignorant of the foundation and progress of Christianity; but he could say nothing about it to please himself or those for whom he wrote, and he therefore found it convenient to pass over the subject *sicco pede*. Can we predicate anything like this of the heathen writers? Scarcely. The religion which circulated among the despised and needy classes had not yet reached their aristocratic heights. If they heard of it at all, it was as a Jewish sect, and the Jews were to them a set of contemptible and disagreeable fanatics. How the philosophers treated objects which they considered below them may be seen in Plutarch's relations to Latin literature. When the Greeks became the political vassals of the Romans, they took their revenge in the republic of letters. Every Roman who aspired to be well educated learned Greek, but no Greek gentleman thought of learning Latin. Plutarch read only what was absolutely necessary to his purpose as a biographer of Romans. He was obliged to consult histories and memoirs; but from all the Latin poets there is precisely *one* quotation in all his 'Lives,' and we have no reason to suppose that he had more than a hearsay knowledge of Virgil or Ovid. If we want a motive and nucleus of the new morality, we must look for them to the good emperors of that era. However much the individual may wither in the

* 'Plutarch: his Life, his Lives, and his Morals. Four Lectures by Richard Chenevix Trench, Archbishop of Dublin.' London and New York: Macmillan & Co. 1873.

present age—and some of us are disposed to think that a Bismarck may still count for something—it is certain that in those days the power of a single man for good or ill might be tremendous.

At the same time, it is not absolutely impossible that Christianity may have influenced the philosophers without their knowing it. A man of our own period may be affected, through a third party, by a writer whose works he has never read, and of whose very name he is ignorant. And similarly, through some despised source, by means of women or slaves, the kingdom which cometh not by observation may have penetrated to the *edita templa* of the Epicurean, and pierced the armor of the Stoic. But this is only a supposition; the negative facts point the other way; and, on the whole, we think it better, for reasons given on a former occasion, to acknowledge as a fact the independence of the later heathen morality.

Archbishop Trench's brief and pithy course of four lectures is perhaps the most promising step yet made towards the rehabilitation of Plutarch. At the first casual glance, we remark that more than half the volume is devoted to the 'Morals'—that is, the miscellaneous writings; and that for these the lecturer has adopted the translation of Philemon Holland, who wrote at the beginning of the seventeenth century—a translation not without very positive merits of its own, but (as we might partly suspect from its age) full of Gallicisms, of Latinisms, and of all manner of archaisms.* And speaking of style, we must remark that the usual carefulness with which the lectures are composed was surely nodding on page 47, where we have this oddly confused clause:

"Extraordinary as the account may seem, in all likelihood it is scarcely an exaggeration; *being, as Archimedes probably was*, the most inventive genius in his own line of things whom [that] the world has ever seen."

Although it does not necessarily follow that a biographer or lecturer admires his hero, such is generally the case, and the reader is prepared to find in Archbishop Trench a eulogist of Plutarch. Sometimes we think he stretches a point in favor of the Sage of Chæronea. Thus he dwells on Shakespeare's liberal use of the 'Lives' in 'Coriolanus' and 'Julius Cæsar.' But, to go no further, Byron made wholesale pillage of a very ordinary novelette for his 'Werner.' Again, while wisely giving up Plutarch's accuracy and critical authority, he greatly commends his love of gossip and anecdote, because little sayings and doings throw great light on character. Up to a certain point, this is true; but a biography made up of little sayings and doings, or chiefly dependent on them for its value, seems to us as great a mistake as a history constructed on the Michelet and Froude system out of petty documents. Finally, not to multiply our instances, he defends, or at least excuses, the universally condemned 'De Malignitate Herodoti' on the ground of local patriotism. Plutarch was a Theban, and could not forgive the great Greek historian for recording so plainly certain ignoble parts which the Thebans had played in Greek history. Surely it was not the fault of Herodotus that he did not live till the Thebans did better, and could not foresee Epaminondas. But after all, there is enough genuine and indisputable material for praise, which we do no begrudge. Thus, whether the logical conclusion implied be altogether tenable or not, the heartiness of this outburst against the virtual atheism of some of the Epicureans has a grand ring about it:

"If you travel through the world, well, you may find cities without walls, without literature, without kings, moneyless, and such as desire no coin; which know not what theatres or public halls of bodily exercise mean; but never was there, nor ever shall there be, any one city seen without temple, church, or chapel; without some god or other; which useth no prayers nor oaths, no prophecies and divinations, no sacrifices, either to obtain good blessings or to avert heavy curses and calamities. *Nay, methinks a man should sooner find a city built in the air, without any plot of ground whereon it is seated, than that any commonwealth altogether void of religion and the opinion of the gods should either be first established or afterwards preserved and maintained in that estate.* This it is that containeth and holdeth together all human society; this is the foundation, prop, and stay of all."

Scarcely less forcible is this protest against their withdrawal from public life:

"Surely impossible it is that they should ever have their part in any great royal and magnificent joy who have made choice of a close, private life within doors, never meddling with the affairs of common weal—a life sequestered from all offices of humanity, far removed from any instinct of honor or desire to gratify others. For the soul, I may tell you, is no base and small thing, extending her desires only to that which is good to be eaten, as do those cuttle-fishes, which stretch their claws as far as to their meat, and no further. Such appetites as these are most quickly cut off with satiety and filled in a moment; but when the virtues and desires of the mind tending to virtue and honesty, to honor also and contentment of conscience, are once grown to their vigor and perfection, they have not for their limit only the length and time of man's life, but surely the desire of honor and the affection to profit the society of men, comprehending all eternity, striveth still to go forward to such action and beneficial deeds as yield infinite pleasure that cannot be expressed."

On the whole, we may say that the Archbishop is a potent auxiliary to the movement in behalf of Plutarch, and also that his 'Lectures' are in themselves agreeable and interesting. Sometimes, too, they show a more than clerical innocence which is extremely touching, as when he pronounces Galepsus in Eubœa, where the guests, "having nothing else to do of great importance, pass the most of the time in devising and discoursing together of good letters and matters of learning," to be wonderfully like a German spa of the present day.

* Such as these pleasant verbs (quoted by the Archbishop): to *baddle*, to *dade*, to *frapple*, to *maffle*, to *thrumble*. In defiance of chronology, Professor Freeman, and the *Saturday Review*, one is tempted to dispose of these queer words by calling them semi-Saxon.

NEW GEOGRAPHIES AND ATLASES.*

BY common consent, geography stands next in importance to arithmetic in elementary schools, and hence an immense amount of time is devoted to it; but much of this time is sheer waste. College examiners are agreed, we believe, that boys, well trained in other respects, are often absurdly deficient in geography; teachers are disappointed at the poor results which follow long-continued lessons; and adult men and women, beginning to read, think, travel, and investigate, are made painfully conscious of their ignorance of the globe. The fault, we are persuaded, is largely due to the current text-books, most of which, like the common English grammars, are far behind the position of modern science. They present innumerable facts, interminable lists of places, and summaries of productions, but with very little philosophical arrangement, and with meagre science. Their use does indeed train the memory, so that the names and positions of lakes, rivers, capes, towns, etc., are remembered; and this is certainly important. Many teachers believe that there is a time, indeed, when the mind of a child has an extraordinary receptivity for geographical nomenclature, and when the finding of places upon the map has all the charm of a game of hide-and-seek. But this learning of place-words and positions is not geography, though it may be "fun."

As a corrective of these defects in existing methods, there have been many recent attempts to introduce new school-books under the inviting name of "Physical Geographies." Some of these, like Herschel's essay, Mrs. Carpenter's compendium, Réclus's brilliant treatises, Ritter's translated lectures, and Lavallée's military geography, though worthy of high commendation, are ill adapted to American schools, and, consequently, are but little used as class-room manuals. Others have been written to order by those who were themselves quite unacquainted with the spirit and modes of modern geographical science, and compiled their works from pre-existing and often antiquated sources of information; so that in many places the mere name of a physical geography is held in abhorrence. In contrast with the English and American geographical manuals, the German school-books and atlases are remarkably good. Writers imbued with the spirit of modern research, and well informed respecting the most recent investigations into the structure of the globe, have provided the German schools with excellent treatises; but they have been so disproportionately full on European, and especially on German, geography, that it has not been worth while to translate them.

Now at length we have an original American treatise, the new 'Physical Geography' of Professor Guyot, which has some noteworthy peculiarities. In the first place, it is the work of one who is a master in his specialty, so that his book is an original treatise, and not a translation or a compilation. We have many excellent geologists among the scientific writers of this country—Agassiz, Dana, J. D. Whitney, Hunt, Le Conte, and others—who may be considered as well qualified as Guyot to present a view of the structure of the globe, from the geologist's point of view; but structure is only one of the aspects which the scientific geographer must regard. The variable as well as the constant must be studied, the laws of temperature and climate, the movement of winds and seas, the distribution of plants and animals, the ethnological characteristics of mankind—everything which makes up the life of the globe, and illustrates the subserviency of the earth to its inhabitants, must be considered, as well as the rocky forms of continent and island. On these varied subjects, in their relation to human society and the progress of culture, Professor Guyot is perhaps the highest authority in the land. He has assiduously devoted his admirable powers to these themes for more than a quarter of a century, first under the best of teachers in Germany, and then as an independent investigator. Before he came to

* 'Physical Geography. By Arnold Guyot.' New York: Scribner, Armstrong & Co.

'First Steps in Geography. Intended to accompany the Atlas of the 'Great Outline.' By Theodore S. Fay.' New York: G. P. Putnam's Sons. 1873.

'Descriptive Hand-Atlas of the World. By J. Bartholomew.' In 26 Parts. Philadelphia: T. Ellwood Zell. 1871-73.

'The International Atlas, consisting of Sixty-five Maps: Thirty-five of Modern Geography, and Thirty of Historical and Classical Geography. By William F. Collins, LL.D., and Leonhard Schmitz, LL.D.' With copious indices. New York: G. P. Putnam's Sons. 1873. Imp. 8vo.

this country, his beautiful monograph on the Neufchatel lake-bottom, and his famous investigations respecting the glaciers of Switzerland, had established his place among naturalists. Here he became an early promoter of the meteorological observations of the Smithsonian Institution, and a special investigator of the height and structure of the Appalachian mountain systems, the peaks of which, in the White Mountains of New Hampshire and the Black Mountains of North Carolina, as well as in the lesser elevations of Vermont, the Adirondacks, the Catskills, etc., he accurately measured with the barometer. His studies have always led him to look at the humanitarian side of science—the bearing of natural phenomena upon civilization and the development of races and peoples. His work, moreover, is the result of great familiarity with American schools. Owing to the want of good text-books, and to his great powers of inspiration as a lecturer, he has been a constant speaker on scientific geography ever since he came among us, especially in Massachusetts, Connecticut, New York, and New Jersey. Thousands of teachers from colleges and normal schools bear witness to his excellent influence in showing them how to observe, how to reason, and how to impart what they have seen and thought.

The volume before us corresponds with the expectations which its announcement awakened. It makes no pretences to being a popular reading-book; there is no attempt to magnify the marvellous, or to attract the seeker after "the curiosities" of nature. Its author might say, as Professor Hadley said of his own lectures on Roman law, "They will scarcely find a place in a library of entertaining knowledge." It is a book to be studied, and is written accordingly in a compact, sententious style; clearness and sharpness of statement are among its chief merits; and the fine powers of generalization which were conspicuous in the Lowell lectures upon "Earth and Man," are also exhibited on almost every page. It is at once an atlas and a text-book. Copious diagrams and cuts illustrate its pages, and, whenever required, double-paged maps of the globe on Mercator's projection are introduced. The maps are the result of great research, and are constructed for this work by Messrs. Sandoz & Krumholz. They embody the most recent results of scientific enquiry. On one, the structure of the globe is indicated, with the chief plateaus and plains exhibited in contrasting colors; another shows the distribution of volcanoes and earthquakes; a third, the lines of equal magnetic declination; another, the isothermals; a fifth, the marine currents; a sixth and seventh, the rain-fall and the wind-courses; the other three, the distribution of the useful metals, the useful plants and trees, and the races of men. The maps and diagrams by themselves are an encyclopædia of physical geography—not detailed enough for the study of subordinate regions, but well fitted to exhibit the globe in its entirety.

The careful study of such a treatise as is now offered to American scholars should precede the ordinary scientific and historical studies of a college course. It should be made the basis for examinations for admission, or if that is not possible in the present state of preparatory schools, students should be required to pass an examination upon its chief sections before proceeding to the study of geology, meteorology, natural history, and the higher physics. It is almost equally important as a basis for the study of historical and political science. An admirable collection of wall-maps, for recitation and lecture-rooms, have been prepared as precursors or companions of the volume before us.

Mr. Fay's 'First Steps' is a book of exercises in the study of an atlas already published by him, and from it, he says in his preface, "everything has been removed which could embarrass the most inexperienced teacher, or the young pupil of nine or ten." He adds that it is not "intended exclusively for young children. All persons, young or old, with misty ideas on Geography will find it easy and advantageous to go through the lessons." The mode of instruction employed is the repetitionary instead of the mnemonical, according to Mr. Fay's distinction, and there is no doubt that it is the better of the two. Physical geography forms but a part of the scheme, of course. It is treated in an order and from a standpoint differing considerably from those of Professor Guyot, in the work just noticed, and, whatever it may do for the pupil, will probably be of less service to the teacher himself as a means of enlightenment.

In Zell's 'Hand-Atlas' the maps are neatly and attractively engraved, with full coloring, and will be found sufficiently accurate for common use; and, except for the rapid advances of geographical knowledge in these days, they would probably also be complete enough. The several maps of the United States are about the best feature of the work, which of course recommends it particularly to the American public. Critical examination reveals some imperfections which show that the latest authorities have not always been consulted; as, for example, in the map of Beloochistan, the river Dusti (more properly, perhaps, Deshti, but here printed Dasti) is represented as having a northeast course straight from its mouth, whereas, after reaching the 26th parallel, its course is nearly due east to a point beyond the 64th meridian. There is no indication of the disputed boundary between this country and Persia. Although the Stanley-Livingstone additions to the cartography of Central Africa have not been neglected, we miss Stanley's starting-point, Bagamoyo, opposite Zanzibar; yet, oddly enough, the name is put down in the general index, while wanting both on the map and in the special index to the map of Africa. The scale of this map hardly permitted the introduction of Gerhard Rohlfs' discoveries, and Dr. Nachtigal's are, of course, too recent. Schweinfurth's are tolerably indicated on a map of the Nile basin, between which and the map of Africa we notice several inconsistencies in the spelling of proper names; as, Bahiada and Bayudah; Riadth and Riad; Meraweh and Meroe; Ipsambul and Ipsambool (so Khartum and Khartoom). Schweinfurth's Niam-Niam is anglicized Neam-Neam; then why not (and *a fortiori*) Welle for Uelle? The statistics of this atlas are very condensed, but we have found them generally correct. The latest available census returns have been adopted in many instances, as for Buenos Ayres (1869), Canada (1871), and New Zealand (1871); but the German census of 1867 is given in place of that of 1871 (to be sure, the increase has not been very great), the Greek census of 1861 for that of 1871, and an old census of the Presidency of Bengal for that of 1871–72—involving a difference of 20,000,000 in the total of the population.

Mr. Bartholomew's hand is again seen in the maps of the 'International Atlas' of Messrs. Putnam's Sons. They are mostly smaller than those in the 'Hand-Atlas,' but they have substantially the same character. The treatment accorded to the United States is not much above that of the common-school atlas. The classical and historical maps, if not very minute, answer well enough the needs of the general reader and are conveniently bound up with the modern series. The comprehensive "introductions" of Drs. Collier and Schmitz seem, so far as we have tested them, to be noticeably accurate in their dates, and give added value to the atlas.

Old Rome and New Italy. (Recuerdos de Italia.) By Emilio Castelar, author of 'The Republican Movement in Europe,' now publishing in *Harper's Magazine*. Translated by Mrs. Arthur Arnold. (New York: Harper & Brothers. 1873.)—"This book," the author says in his preface, "is the record of the lively emotions awakened in my soul by the marvellous spectacles of Italy," and certainly the reader will not be likely to complain of the want of liveliness in the emotions. The book contains eleven chapters of a very discursive kind, filled with rhetoric and sentiment of a sort with which we are all very familiar, and which is to us rather uninteresting. In the chapter called "The Great Ruin," for instance, Señor Castelar gives the first impressions produced upon him by his visit to the Coliseum. To see Rome had long been one of the most anxious desires of his heart. "As a boy, the Roman religion spoke to me of God, of immortality, of redemption; of all that enlarges the horizon of the soul, even to the infinite. In youth, the Latin language was my chief study—a study that, to a plastic imagination, showed in high relief the sweet verses of Virgil, the conciseness of Tacitus, and the grander periods of Titus Livius, those heroes of antiquity who lived for liberty and for their country." We have then a time-honored allusion or two to Roman literature and Roman law: to "those hills from whence so much light has shone upon human consciences"; the sepulchres, the illustrious remains in the sepulchres, "the stones embrowned by sun and time, where consul and tribune have carved their names, apostles and martyrs their crosses." Then we have a page or two telling us that, "tired of politics in Madrid, of commerce in London, of gaiety in Paris, and even of nature in Geneva; wearied also with the positive tendencies of our age, visible at every step and every moment," Señor Castelar "took refuge at Rome, in order to spend some happy hours with history, art, and religion," and that even in Rome he could not quite shake off the age, on account of a sinful republican friend who had been living for twenty years "under the Pontifical rod," and who wished to unburden his soul about the condition of that city; then we have a description of some Catholic "sorcery," which the author saw with no sympathetic eye; and then we are invited to "plunge into antiquity as a diver in the sea." We take this plunge, and come to the surface in a sea of rhetoric: "Is it true that we have before us a trembling light, pale and almost imperceptible? Is it like that of the glow-worm—like that which we call an idea? Is it true that with this light we can kindle the material world, dissipate it, and offer it to the spirit as the smoke of a sacrifice?" We have no space to give the answers to these questions in detail, but in general we may say that they are in the affirmative, and, while "protesting with vain reflections against human littleness," we arrive face to face with the Roman Coliseum and vivid recollections of the gardens of Nero, which easily leads us to reflections on the iniquity of religious persecution, and a comparison of Nero to the present Emperor of Germany, who, it seems from Señor Castelar, is even more inhuman in his crimes than his Roman prototype—for, though Nero murdered his mother, he at least "felt on

the sea-shore the grief of Orestes, and heard the murmurs of the Eumenides," and though Nero oppressed humanity, he at least proclaimed aloud, in his last hour, "that he ought to have been an artist, but not Cæsar." Then follows an historico-æsthetic account of the Coliseum, in the course of which occur some passages which in an oration might be really fine, but in a book of recollections sound altogether too grand. The book gives the reader a strong impression of the author's sincerity, and at the same time a strong impression of the great danger there is in an oratorical training for a tourist. Those who have been struck from time to time with the bursts of eloquence which have animated some of Castelar's speeches in the Spanish Cortes, will be forced to doubt the probability of its adding to his fame, particularly as so much is necessarily injured in the translation.

Josh Billings's Farmers' Allminax. (New York: G. W. Carleton & Co. 1874.)—Not only does the revolving year seem to bring to Mr. Billings the same amount of sense that its predecessors brought him; but what is now his stated supply of nonsense also seems to come in regularly, and to be about equal in quality to what it was formerly. His mule, however, we must remark, is in this book neither so ubiquitous, so inscrutable, nor so much a moral agent as we have known him to be; nor is he so efficient as he was in the days when he could hit a gentleman twice in the same place within the space of one second—so "sure-footed" was he. Specimens of the practical wisdom which makes Mr. Billings no contemptible lay-preacher with a hundred thousand or two of people who con his *Allminax*, are the following apothegms: "Trust in God first, your neighbor next, and yourself last"; "There is now and then a man who knows that he is a fool; such a man is a hard man to cheat"; "There is a great deal of genius in the horse-swap business, but few assets"—a most consoling truth, and a truth indeed in the long run; "We all of us take our corn to the rich miller; money makes money"; "Human nature is like cow nature; I have known them both to give a good mess of milk, and then kick it over"; "The only really natural thing about a man is his conscience"; "Enough of good luck will ruin any man"; "Where there is one man obstinate because he is wise, there are 4,695,853 obstinate because they are ignorant"—a saying in which Mr. Billings's figures he probably "quotes entirely from memory," as he did on another occasion, when he set down the total number of rats resident in this country in 1868, and enumerated them to a rat. Of Mr. Billings's nonsense we can only say that it is as powerful as ever, and that the analysis of it we cheerfully leave to other hands. At all events, either the wisdom or the folly of this ephemeris may be said to be "alone worth the price of the volume." We ought, perhaps, to warn the unsophisticated that of the lore commonly found in almanacs—even in some which profess to be funny—there is hardly a morsel to be found in this one. One may learn from it on what day of the week a given day of the month falls; but that is all. And, in fact, on second thought, we do not vouch for so much as this. We do not know *à priori* why the production should contain anything at all of useful information, and *à posteriori* knowledge we have not sought.

PUBLISHED THIS DAY.

INGRABAN. The second novel of a series entitled "Our Forefathers." By Gustave Freytag, author of 'Debit and Credit,' etc. 16mo, $1 25.

"Gustave Freytag has entered upon a work of very great importance. It is what may almost be called a romance-history of civilization."—*N. Y. Evening Mail.*

"One of the best of Freytag's novels."—*Boston Globe.*

RECENTLY PUBLISHED.

A PAIR OF BLUE EYES. By Thomas Hardy. $1 25. "It is a valuable accession to the higher ranks of modern novel-writing authors."—*London Spectator.* "Deserves to be put on the same shelf with 'Dorothy Fox' and 'Hero Carthew.'"—*N. Y. World.*

THE WOOING O'T. A new English novel by Mrs. Alexander. $1 25. "Most delightful."—*N. Y. Mail.*

HERO CARTHEW. By Louisa Parr, author of 'Dorothy Fox.' $1 25. "By far the healthiest little love-story that has lately appeared."—*Boston Globe.*

HENRY HOLT & CO. (late Holt & Williams), 25 Bond Street, New York.

WHAT CAN SHE DO?

The new story by the author of

'BARRIERS BURNED AWAY,'

NOW READY.

I.

AN OUTLINE STUDY OF MAN;

OR,

THE BODY AND MIND IN ONE SYSTEM.

With Illustrative Diagrams.

BY MARK HOPKINS, D.D., LL.D.,

Late President of Williams College, author of 'The Law of Love,' etc.

1 vol. 12mo, cloth, $1 75.

This work is on an entirely new plan. It presents man in his unity. This unity is through a law that connects man with what is below him, and that makes the structure of the universe up to him pyramidal. The place of man being found through this law, he is built up step by step till a law of conduct is reached. In doing this, his several faculties and their relations are so presented to the eye in illustrative diagrams as to be readily apprehended. The work is commended to the attention of all who would attain and promote a better knowledge of man; and its method is especially commended to the attention of tea

II.

The Second Volume of

UEBERWEG'S HISTORY OF PHILOSOPHY.

BY DR. FRIEDRICH UEBERWEG,

Late Professor of Philosophy in the University of Königsberg.

Translated from the Fourth German Edition by George S. Morris, A.M., Professor of Modern Languages in the University of Michigan. Vol. II.—With an Essay on English Philosophy, by Dr. Noah Porter, President of Yale College; and on Italian Philosophy, by Professor V. Botta.

One vol. 8vo, cloth (uniform with Vol. I.), $4.

The work complete, $7 50.

ALSO JUST PUBLISHED.

THIRD VOLUME OF THE SPEAKER'S COMMENTARY. Edited by Rev. Geo. Rawlinson, M.A. 1 vol. Royal 8vo, $5.

DR. HOLLAND'S ARTHUR BONNICASTLE. A Novel. One vol. 12mo, with 12 full-page Illustrations, $1 75.

BAGEHOT'S LOMBARD STREET. A Description of the London Money Market. One vol. 12mo, $1 75.

HARPER'S CATALOGUE. The attention of those designing to form libraries, or increase their Literary Collections, is respectfully invited to Harper's Catalogue, which comprises a large proportion of the standard and most esteemed works in English Literature—*comprehending over three thousand volumes.*

Librarians, who may not have access to a trustworthy guide in forming the true estimate of literary productions, will find this Catalogue especially valuable for reference.

The Catalogue is arranged alphabetically by the authors' names, anonymous works by their titles. The index is arranged by the titles of the books, besides having numerous appropriate heads, each general head being followed by the titles of all works on that subject.

Harper's Catalogue sent by mail on receipt of six cents.

Address HARPER & BROTHERS,

Franklin Square, New York.

BOOKS BY MAIL.

Orders for books are subject to the following conditions, which must be strictly observed:

1. That the money be forwarded in advance whenever the price is known.

2. That enquiries as to price or other particulars be accompanied by a *stamped* and addressed envelope for the reply. (These enquiries should be as *specific* as the knowledge of the writer will permit. It is presumed that in most cases the name of the work, of the author, or of the publisher can be given.)

3. That both money and books shall pass through the mails at the risk of the purchaser.

THE WEEK IN TRADE AND FINANCE.

OCTOBER 6, 1873.

WE are able to report this week a very decided change for the better in the condition of financial affairs. The Clearing-House certificates, which to the amount of twenty millions were issued upon the pledge of collaterals deposited by the banks with the Loan Committee—the certificates being receivable at the Clearing-House in place of greenbacks in payment of debit balances—have answered well their purposes, and the condition of the banks has so far improved as to admit of the cancellation of one million of them on Friday, followed by another reduction of $1,500,000 on Saturday. At the meeting of the Loan Committee on Saturday, the following resolution was passed:

"*Resolved*, That the Chairman of the Committee request all banks which have taken out loan certificates to return and cancel them from day to day, as early as practicable, that the aggregate may be rapidly reduced."

According to Saturday's advices from Washington, the outstanding amount of legal tenders has been increased from $356,000,000 to $358,000,000. Why is it that the Secretary has drawn upon the $44,000,000 "reserve" to the amount of $2,000,000 at this time, when by doing so two weeks ago, or letting it be *officially* known that he would do so in case of need, it would have done some good? After all Mr. Richardson has said about "keeping within the law," this last act is certainly calculated to make people believe that no dependence whatever can be placed upon what is said by Treasury officials. During the panic, the course of the Treasury Department was marked by ignorance and want of decision.

No bank statement was made public this week, and no statement will be made until the entire amount of loan certificates now outstanding is retired and cancelled. The want of uniformity in the returns is the alleged reason why the statement is not made public; but, most likely, bank managers consider that it would be imprudent, in the present condition of affairs, to publish anything which would show the very low state of the bank reserve.

The action of the savings-banks in hoarding greenbacks at this time is severely criticised, and is hardly conducive to a restoration of confidence, which is really the only thing now required to bring about a complete settlement of business affairs. Several important failures have taken place since our last, among others the following: Northrup & Chick, and George Bird Grinnell & Co., bankers and brokers of this city; the Glenham Woollen Manufacturing Company, Paton & Co., and Peake, Opdycke & Co., merchants. The cause of the failure of Northrup & Chick is the old story of heavy drafts by correspondents, while that of Messrs. Paton & Co. seems to have been the mixing up the business of selling dry goods with that of building railroads. The liabilities of Messrs. Peake, Opdycke & Co. are stated at $2,500,000, all of which the firm proposes to pay in monthly instalments of 10 per cent., beginning December 1. They profess to have a surplus of assets above liabilities of about $500,000. The firm transacted a large dry goods, jobbing, and importing business—one of the largest in the city—and their failure was brought about by the difficulty experienced in making collections. No serious fears are entertained, among those who have the best means of judging, that these failures among merchants will extend to any alarming degree.

The failure of George Bird Grinnell & Co. is an important one as affects Wall Street. On Thursday morning, the firm was served with an order issued by Judge Blatchford, of the U. S. District Court in Bankruptcy, upon the complaint of a creditor to the amount of some $3,000 only, that the firm had refused to pay on demand the balance to his credit with them, and that the firm had become bankrupt. The order is returnable before the court October 11. An injunction was issued by the same judge, restraining all parties holding securities of the firm, as collateral or otherwise, from selling or disposing of them in any manner. The effect of these legal proceedings is to compel the present holders of Grinnell & Co.'s stocks to carry them along, at whatever cost or inconvenience; and as the whole matter bore upon its face the probability that the proceedings were brought about at the instance of the firm itself, the Governing Committee of the Exchange met to consider what action was necessary in the premises. The Stock Exchange members of the firm were summoned to appear before the Committee, and did so, but, under advice of counsel, refused to answer any questions; upon which the following resolution was passed by the Committee:

"*Whereas*, G. B. Grinnell and J. C. Williams have refused to comply with the laws of the New York Stock Exchange; therefore,

"*Resolved*, That they be declared no longer members of the Association."

One of the most cheering signs of the times is that commercial paper has commenced to move, although not very freely as yet. Rates are quoted at 15 to 18 per cent. Money on call has been scarce, but there has been a market for it most of the week, during which time the rates have ranged between 7 per cent. per annum and ⅜ per cent. per diem. At the close of the week, Saturday, the rates fell to $\frac{1}{16}$ per cent. per diem, and at the close of the day money was freely offered at the legal rate.

On Monday, September 29, at a special meeting of the directors, the Bank of England rate of discount was advanced to 5 per cent., but no further advance was made at the regular meeting on Thursday. The Bank lost during the week £1,904,000 in bullion. The Bank of France gained 4,000,000 francs in specie.

The Stock Exchange opened on Tuesday, September 30, and the opening was unaccompanied by any excitement whatever, and with the fluctuations by no means wide, considering that the Board had remained closed for so long a period. The tendency of prices was downward, and the market continued weak until Friday. Investors seemed to have held off, expecting that the sales of stocks made for the purpose of settling up old contracts, in anticipation of the expiration of the three days' time during which the law was suspended providing for the selling out of stocks "under the rule," would carry down prices to a still lower point. But outstanding matters seem to have been pretty well settled up, and very few stocks were sold out "under the rule" on Friday. Parties who had been waiting to buy saw that it was useless to wait, and the last half-hour of the session witnessed very active dealings and a rapid advance in prices. On Saturday, the prices of the day before were not only fully maintained, but the demand for stocks carried up Central 1¼ per cent.; Lake Shore, 3 per cent.; Rock Island, 1⅞ per cent.; Western Union, 3¾ per cent.; and other stocks in proportion. In fact, brokers met with considerable difficulty in filling their orders, in consequence of the scarcity of supply.

Prices of all good dividend-paying stocks are still very low, and we doubt very much if the prices of last week will be seen again for years. No better time than the present will probably offer itself to investors. Speculators have no chance in the present state of affairs, as brokers are unwilling to carry stocks on margins at this time. By the time they are ready to do so, prices will have so far advanced that parties who are now able to make their purchases for cash will be very willing to sell out to the professional speculator at those then current. Foreign capitalists have already seen this, and large purchases of the best dividend-paying stocks were made last week by their agents in this city, and one house with German connections purchased 10,000 shares New York Central and Hudson River stock at about 90. Fluctuations may occur, in consequence of weak parties having to sell out to raise money with which to take up their loans at bank, and prices may go down a little; but for investors it seems to us to be a particularly good time to lay in a good supply.

The following shows the highest and lowest sales of the leading stocks at the Stock Exchange for the week ending Oct. 4:

	Monday.	Tuesday.		Wed'day.		Thursday		Friday.		Saturday.		Sales.
N. Y. C. & H. R....	Board closed.	90	93¼	90	92¼	89	92	91⅜	93⅜	93¼	95⅛	48,309

Dealings in railroad bonds have been light, investors seeming to prefer good dividend-paying stocks, the prices of which have declined to a greater extent than those of railroad bonds. There appears to be plenty of orders in the market, but the limits are considerably below the price at which they can be obtained, the really very cheap bonds in the market having been taken during the time the Exchange was closed.

Gold declined to 109¾ on Friday from 113¼, the opening price on Monday, and has not since advanced more than a fraction, remaining at 110 and under all day Saturday. The large amount of gold now on the way from England exerts a depressing influence on the premium. The Secretary of the Treasury has, as yet, issued no programme for gold sales and bond purchases during the month of October.

The Nation.

NEW YORK, THURSDAY, OCTOBER 16, 1873.

The Week.

THE President has made public through the Associated Press his views on the financial situation. He finds the panic evidently different from those which have preceded it, because, in former panics, a distrust of the currency in circulation has caused every one in possession of it to run to the banks to change it for gold; in this panic, however, everybody's desire is to get more currency, and the currency is becoming daily more valuable. He asserts that he sees "in passing events" the first steps towards resumption, because of the general prosperity of the country; that the aid rendered by Government in the purchase of an extraordinary number of bonds was "not so much real as moral," inasmuch as it tended to restore confidence in the midst of a general "stampede"; that return to a specie basis cannot be effected except by a "shrinkage of values," which always "works hard" with a large class of people who "keep all they are worth in margins"; that this shrinkage, however, has now taken place. The President wonders, inasmuch as silver is worth no more than currency, why "silver is not pouring out." When it does, his theory is that the country can absorb from $200,000,000 to $300,000,000 of it, which would be a great benefit, as it would supply a market for the product of our mines, "now becoming a drug," and it would take the place of the forty millions fractional currency, and would "become the currency which would be hoarded in small amounts." As to legislation, the President says that if Congress were now in session he should recommend the reissue of the $44,000,000 reserve, "a free banking law, with the same protection to bill-holders as now; a repeal of the clause requiring a reserve for the protection of depositors; a percentage of the other reserve to be in gold, and that increased in a regular ratio, until the whole reserve should be in gold." "This would be solely effected by requiring such institutions to save the whole or a large percentage of the gold interest, paid to banks on their bonds held by the Treasurer of the United States for the protection of bill-holders." He also favored an "absolute prohibition of the payment of interest on deposits." The President is also opposed to "the demoralizing and injurious speculation and gambling" caused by the accumulation of capital in large cities, when it is not needed for moving the crops. The President will probably recommend a post-office bank, to pay four per cent. on deposits, which are to be converted into Governments.

The President has a well-deserved reputation for good common sense, and everybody, whether friendly or hostile to the Administration, must regret that he should injure it as much as he does by his utterances on financial or commercial questions. Many of them, in his messages, like that early one in which he proposed to pay off the National debt with the product of the Western gold mines, have been very strange; but then we were disposed to believe that the political economy of the message was not his own, but was supplied by some of the great lights of the science who form his more immediate circle of adherents. Talks like this last one, however, seem to warrant the belief that he really plumes himself on his financial knowledge and insight; if he did not, so taciturn a man as he is would hardly rush into such dangerous places in company with a newspaper reporter. Apart from their unpleasant effect on the President's reputation, not as an economist, but as a "sensible man," they are objectionable, from the alarm they are calculated to spread at this crisis through the business community. Nobody who recollects how much power the Government has over the money market under our present system, can listen to such talk on the part of its chief officer without great anxiety. A gentleman who insists on our issuing a fresh supply of inconvertible paper as a preparation for a return to specie payments; who wants to bring silver into circulation in order to encourage the silver mines; would prohibit banks from paying interest on deposits, and, at the same time, recommends that the Government go into the banking business on this very system, people hardly like to see connected with the Treasury.

There are some questions relating to the affairs of the First National Bank in Washington, which was brought down by the suspension of Jay Cooke & Co., which have not been asked, one or two of which it would be well for Mr. Secretary Richardson to answer. A receiver of the bank was appointed, and is now in charge of it. He reports that he found only $67,000 in currency of all kinds. Now, the last bank statement showed that the bank held $140,000 in greenbacks of the $300,000 it was bound to hold as reserve. The question is, What became of the difference? and it is suggested by the common belief in Washington that all the influential depositors were paid off before the funds were turned over to the receiver, on the ground that they were "special depositors." Another is, How came the United States to have $287,000 ($187,000 illegally, because without any security) on deposit in this bank when the Treasury vaults are on the other side of the street? Finally, Why, when Section 29 of the National Banking Law forbids any bank to advance more than one-tenth of its capital, or, in the present case, $50,000, to any one person or firm, were Jay Cooke & Co. allowed to become the debtors of this bank for thirteen times this amount?

It would be well to remember in the present fever of indignation against fraud and dishonesty that there is a considerable number of honest men in America. The state of things is bad, no doubt, but then we ought not to lose our heads over it. The cases of dishonesty revealed by the late panic amount to about six all told, which is six too many, and some of them are undoubtedly symptomatic of great looseness of management, as well as of want of integrity. But in lamenting over them, we sometimes talk as if defalcations were so numerous that we could hardly keep count of them, and as if all cashiers and treasurers were under a cloud. This is, to say the least, injudicious. We venture to assert that the defalcations and frauds bear a very small ratio to the trust reposed. Our business is transacted on trust to an unprecedented degree. There is nothing in the world like the way in which vast sums of money pass from hand to hand in this city by nods and verbal promises. The loans made to brokers by the banks on mere parole have been during the past two or three years something stupendous in amount, and yet when the crash came there was just one broker, only one, who had failed to make good his overdraft. Considering, too, the way directors seem to neglect their duty, the small amount of fraud revealed among tellers and cashiers has been something really remarkable. Business doubtless ought not to be done in this way, but we must say we think the revelations of the panic have been on the whole creditable both to human nature in general and the American variety of it. We would add, for the benefit of those rural moralists who roll their eyes in horror just now whenever they speak of a broker or "speculator," that it would be well for a good many of them to be able to say that they had come through one-half the temptations to which brokers and speculators have of late been exposed with so little damage to morals or reputation. The panic is not going to regenerate us, but then we do not need regeneration nearly so much as some people are trying to make out.

Nothing has been heard from the farmers for some time now, principally for the reason that since the panic began they have found the transportation question a more practical one than it was

a little while ago. In the pleasant summer months, when there was little to be done except nominate candidates and promote social intercourse, they discussed the general principles of the subject, and passed resolutions, which were of a very various character, because each farmer had as good a right to his or her general principle, and his or her resolution, as any other farmer; but there was a good deal of harmony throughout the West on one point—that there must be no compromise with the railroads, that the monopolists must be beaten at all hazards. We are glad to be able to say that harmony still prevails, though now it is produced by rather different feelings. The great difficulty in getting the grain to market at all has led the railroads to offer the farmers to transport the crops for them without money, on credit, or receiving their pay in kind, and these offers, we understand, the farmers show no immediate disinclination to accept. There must, however, be some devilish malice about this offer on the part of the monopolists, or they would not make it. Probably they want to get hold of the corn and wheat, and burn it up.

Senator Windom's Transportation Committee has disbanded, owing to the commercial crisis, and will not come together again before the meeting of Congress. This Transportation Committee, as we have repeatedly pointed out, is one of the most monstrous impositions connected with the great transportation reform. It was appointed, at the suggestion of the President, to bolster up a crazy scheme of inland transportation, and at its head was placed Mr. Windom, who was at the time director in the Northern Pacific. Since the collapse of this road it has come out that, two years ago, application having been made to the Union Bank of Vienna, and also to certain capitalists in Berlin, two committees came over to the United States, and made a personal examination of the line of the road, the result of which was that they advised their principals to have nothing to do with the road, for the simple reason that it could not earn interest on its bonds for some years to come. The report of Haas, the Berlin commissioner, has been published, and he conclusively shows—not that the Northern Pacific was bad property, but that as it passed through an unpeopled country, it must require several years to build up a business of $20,000,000 a year, or to bring in emigrants and by sale of lands accomplish the same result. Herr Haas came to the conclusion that the interest must soon fail, and we are sorry to say that the provisions contained in the mortgage of $100,000,000 for the security of the bondholders looked to Herr Haas less like a security for the exercise of their rights "than a troublesome obstacle to the execution of rights guaranteed to the bondholders by the general laws of the United States of America"—a rather natural conclusion from the fact that the bondholders have absolutely no remedy of a practical character until after a failure of interest for three years. As to the land-grant, the report declares it to be very good, and we are glad to take this opportunity of contradicting the story which we have done something to disseminate, that the road runs through a wilderness.

The elections which took place on Tuesday involved no national offices except in Oregon, where, to fill a vacancy in the delegation, a Democratic Congressman, Nesmith, was chosen by a fair majority in a rather close contest. Whether the result of the voting in Ohio was such as to ensure Senator Thurman's re-election by the Legislature, is undecided at this writing. The Democrats appear to have made extensive gains, the vote being generally light, and the tickets heavily scratched; but we still hope it will prove that Gov. Noyes at least has not been defeated, if only because, as the Cincinnati *Commercial* has said, the election of his opponent, Allen, "would encourage false hopes of a Democratic national revival, and destroy the reasonable hopes entertained of the ability of Democratic citizens to make themselves useful outside of their old party lines"—in confirmation of which we may refer to the *World's* head-lines of Wednesday. The elections in Pennsylvania and Iowa were carried by the Republicans—in Iowa embracing an entire State ticket, and polling a large and earnest vote.

We referred last week to the recent events in the St. Louis and Baltimore Post-offices as showing that civil-service reform was making a little more headway. Mr. Dorman B. Eaton has published a letter, in which he once more declares the President to be in favor of the reform, and asks its friends to have patience. There seems good reason to believe that the real state of the President's mind on the subject is this: he finds that the new system in the minor offices is a great blessing, because it relieves him of responsibility, and also of importunity. As to the greater offices, he approves of it in principle, but finds it inconvenient in practice, because it sometimes interferes with the appointment of his friends and dependents. This, however, though spoken of in certain quarters as a bad sign, shows a distinct advance in the reform, when we compare its position now with its position two years ago. Then the system was new, and even among the civil servants themselves it had few friends. Now it is at least in working order, and has commended itself to the President by its saving of time, and to the employees by relieving them of an onerous tax. Congress is its great foe now, but then Congress is the common enemy, we were about to say, of mankind.

The Evangelical Alliance closed its sessions on Saturday evening with undiminished éclat. We have elsewhere noticed the modifications revealed by the discussions in the theological view of Darwinism, or the development theory. The other noteworthy feature of the proceedings was, as we remarked last week, the participation of some of the Episcopal clergy in the communion service at Presbyterian churches. This has called forth a vigorous protest, addressed to Bishop Potter, by Dr. Tozer, a missionary bishop of the American Church, apropos of the Dean of Canterbury's course. Another missionary bishop, Dr. Cummins, has replied in the Dean's defence, and acknowledges that he himself was guilty of the same offence, if offence it be, at Dr. John Hall's church. Bishop Potter, we believe, declines to interfere; but it is hardly likely that the controversy will end here, or that it will not embitter the quarrel between the High and Low Church, especially in England. The Alliance was the subject of a vigorous assault for its narrowness from Dr. Bellows, on behalf of conservative Unitarianism, on Sunday night, and he made one suggestion which is not likely to be adopted, namely, that in country districts in which not the church only but all religious expression is rapidly declining, the various sects should unite in one organization, adopting the form of worship of the majority as the best, and it may prove the only, means of resisting a much more formidable foe than the heterodoxy about which the Alliance is so much occupied, viz., blank indifference to all 'doxy. The Catholic Church, through Fathers Lake and Flattery, treated the Alliance to the usual allowance of sorrowful pity.

A savage attack has been made on Comptroller Green by Mr. John Foley and a number of gentlemen who were a year or two ago reformers, and are now what we may call reform politicians. The charges against Mr. Green are, 1st, that he has left some $6,000,000 of the city money on deposit with banks which were not asked for any interest; and, 2d, that he employed two gentlemen, Nelson J. Waterbury and Dexter A. Hawkins, to lobby before the last Legislature, ostensibly to protect the interests of the city, but in reality to keep Mr. Green in office. There does not seem to be any foundation for these charges, which have been laid before the Mayor, and every one knows that the object of Mr. Foley and his friends is simply to get Mr. Green out of office and some one else in. The prospect of the city treasury being again made the football of the politicians is not at all pleasing, and it is extremely unlikely that the charges will come to anything. Mr. Green is not a model man in all respects, but he is an angel of light compared with his enemies, the deadliest of whom, Mr. Van Nort, came into office, it will be remembered, as the protégé and substitute of Wm. M. Tweed.

By the annexation of Charlestown, Brighton, and West Roxbury, Boston increases its population by about forty thousand people, and as the business of the city is continually increasing, and the burnt district is built over and better built than before, Boston now justly looks on herself as an amazing proof of the wonderful bounty of Providence and the industry and morality of her own citizens. It is hardly more than five years since men who took a lively interest in the welfare of the city believed Boston to be a decaying port, soon to rival in the downfall of her commerce the decline of the long since ruined ports of Salem and Marblehead, and yet Boston is to-day perhaps the most prosperous city in the United States. Notwithstanding this, the city government is declining in quality with the growth of the place, in accordance with what seems to be almost a law of American development. The latest evidence we have of this is that the fire of last year has as yet produced no change in the administration of the Fire Department, the city government occupying itself with reports and debates, while the incompetent officials, or at least, many of them, remain securely in office.

France is still occupied with preparations for the approaching struggle between the Monarchists and Republicans, and the latter draw considerable encouragement from the winning of three seats in the Departments of Puy-de-Dôme, Loire, and Nièvre by heavy majorities. M. de Rémusat has got in among others. These Departments returned Conservatives at the last election, and it looks as if the machinery was somehow out of order, or that the Comte de Chambord is a bad candidate. Nothing is easier than to frighten the peasants with threats of the return of the old régime. A deputation of the majority has gone to Salzburg to visit the Count, and will make a report to the bureaux of the Assembly. His letter, to which we alluded in our last, to the Vicomte de Rodez-Benavent, has been published, and in it he denies solemnly the truth of the reports which attribute to him a desire to restore feudal rights, religious intolerance, clerical supremacy, or to engage in a war with Italy. He evidently grows prudent or liberal as he gets near the throne. The trial of Marshal Bazaine is progressing slowly, several days having been consumed in reading the old reports of M. Rivière. He is now under examination by the Duc d'Aumale, the president of the court, and the report of the result will be very interesting. The most damaging charges produced thus far are those based on the condition of the supplies in Metz when he surrendered. The enquiry will probably injure the Bonapartists badly, by casting fresh light on the Emperor's incompetency. They are now throwing their influence in favor of the provisional government, in order to give their heir time to grow up.

The long-impending fight between the Republican and the Intransigente fleet has come off in Spain, and the insurgents have been worsted. Admiral Lobo having got possession of the two iron-clads captured by the British, went back to Cartagena, and was promptly attacked by the Intransigente commander, whatever his title may be, who was forced to put back after a two-hours engagement. One account says that the action was brought on by an attempt of the rebel iron-clads to escape from the harbor. The insurgents fought their ships with great gallantry, but not much skill. It is now announced that a combined attack by sea and land will be made on the town, and, as the garrison is doubtless in great straits, a surrender may at last reasonably be looked for. From the Carlist war there is no very trustworthy news. A report of a bad defeat is afloat, but then these terrible defeats and victories do not seem to do either side much harm or good. The mere failure to have made good their footing south of the Ebro by this time is, however, fatal to the Carlist hopes for the present winter. They will have to go into winter quarters, in default of a lodgment on the plains, but the spring will doubtless see them as active as ever.

At a recent meeting of the Société d'Economie Politique in Paris, some very interesting information with regard to the character and economical causes of the insurrection in Spain, was given by Messrs. Figuerola and Etchegaray, both of them members of the Cortes and Ministers of Finance under King Amadeus. M. Figuerola said that the socialism of the great towns like Malaga and Cadiz was the real French article with which everybody is familiar—a mixture of envy, with dislike of regular labor, and utopian dreams as to the possibility of "reorganizing society." The rural communism is, however, a different thing altogether, and is confined to particular provinces. In Catalonia and Galicia, and the north generally, it does not exist. There the land is very much subdivided among peasant proprietors, as in France, and there, as in France, the instinct of property is pushed to fanaticism, and the people are passionate and frugal cultivators. In the south, on the other hand—in Andalusia and Estramadura, which were conquered at a comparatively late period from the Moors, the soil was bestowed in large grants on the nobles who distinguished themselves in the wars, or chanced for any reason to be the king's favorites, or on churches and convents. It is accordingly held now in immense estates by absentee proprietors, and the scanty population, not over twelve to the square mile, is massed in a few large towns or villages. In fact, it consists wholly of great land-owners and laborers; and the laborers, who rarely see their masters, as soon as a revolution breaks out seize on the farms. In doing this, however, they are by no means instigated by communistic ideas. They do not mean to share with everybody, but simply to oust the legal owners and take their places. Sometimes they have been left in possession by the frightened nobles or monks, and then they have, in default of the means of working the land, sold it out for a trifle.

M. Etchegaray added that, in fact, a general seizure of the large domains and of all Government property, such as the forests and salt-works, has long been in these southern provinces an ordinary accompaniment of a political revolution at Madrid, and the intruders have always held them a few months, until the new government got sufficiently established to send down troops to dispossess them. The result, of course, is that the very notion of law as a means of security, and of prescription as the foundation of title, and of revolution as a means of improving the machinery of government, has vanished from the people's minds. A political upturning is to them a means—not, as with the city socialists, of setting up a new social system—but of getting hold of rich people's goods and enjoying them. Both gentlemen throw much light on the popularity of the Federal movement, by showing that it was due not to a desire to protect local franchises, but to prevent the interference of the central Government with these little redistributions of property made by local majorities. A good land law, breaking up the large estates by heavy taxation, would probably work a cure in a very few years. But the political cure in Spain must begin down among the people, and, until it has been effected, it will matter little what the chief officer of the Government is called.

The reports by mail of Victor Emanuel's reception at Vienna and Berlin show it to have been in both cities most hearty and enthusiastic, particularly at Berlin, where the public greeting partook in no small degree of the nature of an anti-Papal and anti-clerical demonstration. The streets were densely thronged, and the hurrahs plentiful and loud, and the *Re Galantuomo* was flattered by the prodigal sale of broadsides containing his portrait and biography, with verses of welcome and encouragement in the German alliance:

> "Halt fest zu uns, Galanter! Käm Frankreich dir zu nah',
> So schreibe nur an Kutschke, im Umdreh'n sind wir da!"

Bismarck was not on hand at the first meeting of the two sovereigns at the railway station. Francis Joseph's attentions at Vienna were of a sort to stir bad humors among the Ultramontanes, especially the toast which he offered at the first banquet to his "illustrious host, brother, and friend." The French, who read this with no pleasant feelings either, had at least the satisfaction of remarking that the toasts on this occasion were in the language of Paris.

THE PRESENT DILEMMA BETWEEN GOVERNMENTS AND CORPORATIONS.

WE have before us an address by a member of Congress, who is both a Democrat and a distinguished lawyer, the first part of which advocates most earnestly the wisdom of restricting government to the narrowest limit of express powers; the latter part of which denounces corporations as "monsters licensed by government," having "no natural rights," contrived by "the folly or the wickedness of men." There are a great many persons in the community who will agree to the first part of this address as "good, old-fashioned Democratic doctrine," a departure from which has brought down upon the country all of its official corruption; and there are, in the present ferment of the public mind, a great many other men who will applaud the latter part as a true explanation of all the commercial immorality and financial unscrupulousness that now abound in business circles; and there are not a few who will unite, like our member of Congress, in heartily abusing both private corporations and paternal governments.

However soothing this may be to one's excited feelings, is it any more wise than for a child to kick the chair against which he stumbles, and to express in vigorous, unphilosophical language his belief in the total depravity of all inanimate things; or for a sailor to hope vehemently that his ship will go to the bottom because his own carelessness has caused her to lurch badly? With neither a paternal government nor private corporations to carry on those affairs of society which are beyond the scope of individual fortune, can any one tell us what our modern society is to do? Corporations mean combination—the combination of a great number of small amounts of capital into an effective mass or concentration, ordinarily with the condition attached that the money embarked in the venture shall be the limit of the investor's personal responsibility. Does any one mean to maintain that such combinations have been as a whole injurious to this country, or that without them it could have reached any comparable state of development and material wealth? It must be generally conceded that the love of money is the root of the frauds, embezzlements, briberies, and general corruption with which our American body-politic is at this time cursed; but does any one so thinking break out in tirades against a medium of exchange, or seriously propose to do away with money?

For the last thirty years it has been the fashion in this country, especially among our older, richer, and busier Eastern communities, to get rid of political difficulties by the simple process of running away from them. In this State, for instance, prior to the constitution of 1846, the machinery of government was found to work with too much friction; whereupon the very popular doctrine was preached that the world is governed too much, and that the less government we have the better. Some of the radical newspapers of that day even went so far as to hold that the Post-office was a too paternal institution for the Government to have under its charge, and that the business of running the mails, and the end of attaining cheap postage, had better be handed over to Adams Express or some other company. At a time when it cost six cents to send a single sheet of paper through the mail from Albany to New York (a route a little less than 150 miles), and twelve cents to send the same sheet from Troy to New York (a route then supposed to be a little more than 150 miles), if any one had predicted that an improved mail service would enable a man to send three sheets of paper in one envelope from New York to Oregon for three cents without ruining the Government, he would have been thought insane. Indeed, we are not sure but that if the art of constructing giant corporations had been understood then as well as it is now, some of the Congressional manipulators would have persuaded the public that the only way to get cheap postage in this country would be by giving over the Post-office to such a corporation. In other words, when American society retreated from the line of governmental difficulties, it fell back upon corporations as a means of protection and relief.

But now, in the year 1873, the line of corporations, once deemed impregnable, and extolled as "associated individual enterprise," has become untenable. "Associated individual enterprise" is regarded as an admirable thing for enterprising individual managers, and a very bad thing for everybody else. Not only is our mercantile community now laying the blame of the recent panic upon corporations, and our great agricultural community at the West attributing to them all its woes, but through the Eastern rural districts there is a much greater degree of irritation against them than is generally supposed. We can, for instance, point to two New England villages, only fourteen miles apart, which have to pay forty cents for sending from one to the other a telegraphic message of ten words. They contrast this and the double expressage exacted by the ingenious combination and division of routes by the express companies with the cheap, effective daily service of the United States mail, and they believe unanimously in throwing the telegraphs into the hands of the Government. Tell them that a government should not be paternal; that the business of telegraphy cannot be carried on by it as economically as by a private corporation; that in the hands of the Government it would not be self-supporting; and that by the change all legal means of redress would be taken away from them, and they answer that they know better, that the Post-office shows them the contrary every day of their lives, that as to a deficit of a few millions a year, it is nothing compared with the exactions they now suffer, that when they make complaints they are treated with more attention and civility by the officers of the Government than by the agents of the great corporations, and that as to a legal remedy for a delayed telegram or damaged freight, it is practically worth nothing, and no sensible man would ever go to law with a powerful corporation. In short, the forgetful part of the community is now making ready to beat another retreat, and screwing its courage up to the pitch of going back to the very position which the preceding generation declared to be one of the greatest of evils, and into which, it was asserted, mankind on this continent had become too wise ever again to fall.

But the question which every sensible man may as well begin to ask himself and his neighbors, is whether American society has not reached a point from which there is no further line of retreat—whether we are not now upon a line where we must fight out the battle, which should have been fought before this, for the maintenance of decency, morality, and public and private integrity. Fortunately, in the march of recent evils, Government and corporations appear too closely side by side to countenance the idea of our flying to the one as a protector against the other. In public estimation, "Government" means unscrupulous politicians, "corporations" unscrupulous capitalists, and nobody pretends that either can be long used merely as an antidote for the other. It is most desirable that the public mind should be taught to drop the old idea that the Government is a bane and corporations are an antidote, and to shut out the new idea that it is the corporations which form the bane and the Government which may prove to be the antidote; and, instead of these ideas, assume the simple fact that both governments and corporations are merely instrumentalities, absolutely essential to our modern civilization, but which can be and must be controlled, limited, and directed, so that they shall not be detrimental to public morality and shall effectively promote the general welfare.

The lesson to be learned at this time, for it is a lesson which recent experience peculiarly teaches, is that neither governments nor corporations are machines which can be trusted to run alone; and that if society means that they shall be controlled and guided, society cannot abandon the control and guidance to paper constitutions and charters, or to a class called professional politicians, or to another class called kings, emperors, and tyrants. Whenever the public apathy is such that society can skulk away from the duties and difficulties of governing, it is inevitable that a class of persons will assume control who will manage matters exclusively for their own benefit; and it makes little difference whether the place be France or America, and whether the class be self-made politicians or hereditary rulers. The great—and it is an inestimable—advantage which our country possesses, is that our form of government enables society at any time, by peace-

ful and constitutional means, without force, and with a minimum of disturbance, to reassume the control of its governmental affairs, and consign its temporary dynasty to the harmless occupations of private life.

Our Government is not an instrumentality which can be adapted to the making of shoes at the public expense for the public feet; it is an instrumentality admirably adapted to the making of just and beneficent laws, and the thorough and efficient enforcement of them. But so long as a State like Massachusetts asserts the principle of prohibition, and then hands over the task of prohibiting to the classes that are to be prohibited; or so long as Congress goes through the form of making laws against its own corporations, and then practically allows corporations to do what they please with the statutes, we cannot delude ourselves into the belief that society is really using its own instrumentality of government. Legislation, as we all know, is a cheap prescription, generally purchased by a little public clamor. But beyond legislation there is work to be done, and a price to be paid. Of this we have a striking illustration at the present time. In a previous number of the *Nation* (No. 411), when endeavoring to account for the growth of corporate and the decline of governmental power, we asked: "Is not the United States District Attorney in each of the two largest cities on the continent a comparatively young and inexperienced lawyer, whom no corporation would entrust with the control of its legal affairs, but who is entrusted with all the law business, civil and criminal, of the Government? Contrast the array of counsel in the Crédit Mobilier Railroad cases—Mr. Curtis, Mr. Evarts, Mr. Cushing, and Mr. Bartlett—with the Attorney-General and his two juniors. Contrast, too, the liberal fees that will be paid to these really leading counsel with the salaries of the Attorney and Solicitor Generals. Manifestly, society, as represented by Government, is beaten whenever it comes in contact with the great corporations, because society has allowed these corporations to secure as agents men who can outgeneral, outwork, and in any ordinary fight overcome the men who are the agents of the Government." And now we read in the Hartford *Courant* that in the recent argument of those cases, the Government lawyers were no match for those retained by the defence; that their tame and incompetent performance "was painful to all friends of the Government"; that it is clear that they will be "outwitted and outgeneralled" at every point; and that nothing "like a complete investigation or a fair trial can be had under the direction of the present counsel for the Government."

THE WAY BACK TO SPECIE PAYMENTS.

THE denunciation of irredeemable paper money during the last ten years has been so loud that it is not surprising that some of it should have been baseless or extravagant. The world has suffered so much from the substitution for coin of promises to pay which nobody was bound to keep, that when we, with all this experience before our eyes, determined to enter on the same dangerous path, it was not unnatural that many of those who undertook to warn us should have occasionally been betrayed into vehement exaggeration. Accordingly, a great many of our economists have talked as if there was in paper *per se* some occult quality which made it totally unfit for a circulating medium, and which made any resort to it a sure road to national ruin. It has been even inveighed against as a fruitful source of crime and immorality, and as in fact a probable cause of most of our frauds and defalcations. Indeed, we have among us one or two economists who have worked themselves up to the point of believing that nearly every evil by which political or social life is beset in the United States at this moment is due to the use of greenbacks.

Now, the misfortune of this sort of talk is that it diminishes or destroys at critical moments the legitimate influence of those who have made it their business to study the financial experience of the civilized world, and leads plain people to agree with our friend Mr. Boutwell that there is no such thing as a science of finance at all, and that every government can make its own currency to suit its own fancy, and carry on trade in entire independence of the rest of mankind. We are suffering at this moment from the effects of this unqualified or extravagant declamation. The paper money which has been so much denounced is steadily rising in value, and, in fact, enjoys the absolutely unprecedented honor of being hoarded by a panic-stricken community, and at this most critical period in our financial history, when a single step may take us out of the slough of despond, or sink us in irretrievably, we begin to hear people say that, since greenbacks are so good and so scarce, all we have to do to cure us of our present woes is to issue more of them, and that the "theorists" will prove as much mistaken as to the effects of this new issue as they have proved with regard to the effects of the first.

Now, the only objection to paper money for which experience offers any warrant is the uncertainty which, in the absence of redeemability in coin, will always exist as to the relation of its quantity to the wants of the community. Apart from this, it is the best currency possible, inasmuch as it costs little, and is easy of carriage, and it plays a large and daily increasing part in the business of all civilized societies. In England and America, the two leading commercial nations, it plays the leading part. Redeemability in coin is mainly important, not because of any hidden virtue in coin, or any taint of sin in paper, but because it offers the only means of keeping the quantity of the circulating medium in its proper relation to the business of the community and to the circulating medium of other countries; because, in plain English, only in this way do the people retain any control over their instrument of exchange. When paper is redeemable, the entire community decides how much of it shall circulate; when it is irredeemable, half a dozen bankers, or a Secretary of the Treasury, or a dozen needy and ignorant Congressmen, may decide how much of it shall circulate. When paper is redeemable in coin, if the Government or banks issue too much of it, prices at once begin to rise, or, in other words, the country discovers that it has more of the circulating medium of the world than it needs or is entitled to. Money then will, it is seen, purchase more commodities abroad than at home, and, as paper cannot be sent abroad, people carry it back to the bank or the Treasury, and draw out gold for exportation. In this way the volume of the currency is again rapidly diminished, prices fall, and the equilibrum is restored. When irredeemable paper is issued and made a legal tender, all the gold in the country, being of no further use, is sent abroad and sold, and will never come back till room is again made for it by the withdrawal of a portion of the paper, or, what is the same thing, by the inadequacy of the quantity of the paper in existence for the demands of internal trade.

Now, it is the opinion of many of the keenest observers at this moment, and the facts of financial history seem to justify it, that we have gradually gained the effects of contraction by our abstinence from all expansion of the legal-tender currency since 1862. That is, the growth of the community in wealth, which has been enormous, and the increased multiplicity of transactions, which has also been enormous, have gradually rendered our currency inadequate to the transaction of our business, and are producing a steady fall in prices, that of gold included—a fall which has been within the last month precipitated by the panic. Now, if this theory be sound, all we have to do is stand firm, and let the currency alone, and the operation of financial laws will gradually make it profitable to export gold to this country, as, indeed, it is at this moment, and make it profitable to keep it here to meet the demands of internal business. Currency enough people must have; and, if they cannot have more greenbacks, they will provide themselves with gold and silver. This, however, will be a gradual process. It will not be possible for the banks, or perhaps for the Government either, to resume specie payments the day or the month in which greenbacks touch par, but, assuredly, a period of low prices and restricted currency cannot last very long without making it as easy for them to pay coin as paper, because, when people have become familiarized with the idea that nothing is to be gained by exchanging a greenback for

gold or silver, the danger of a run for coin on either the banks or the Treasury will be over.

In this state of facts, nothing can well be more mischievous than even the sign of willingness on the part of Congress or the Treasury to tamper once more with the currency. Mr. Richardson's issues of his "reserve" are, apart from the question of their legality, highly objectionable, because they create and keep alive in the public mind a feeling of uncertainty as to the future, which prevents the restoration of confidence and the return of trade to its ordinary channels. He claimed, last fall, the power to issue greenbacks when he pleased to "move the crops." He did issue $5,000,000, and then suddenly withdrew them. In other words, he inflated and contracted the currency out of his own head within the space of half a year. Naturally, therefore, when the late panic occurred, he was called on to inflate once more. If, it was argued, he could inflate to "move the crops," he can inflate also to save the banks and the mercantile community from bankruptcy. But he then totally denied the possession of that discretion which he had so lightly used in the previous autumn, and pleaded the want of legal authority to touch the "reserve." Within two short weeks, however, he suddenly disregarded this legal prohibition, and issued $3,000,000 of the "reserve," and, at this writing, leaves it uncertain whether he will not issue the whole $44,000,000, thus plunging the community in doubt as to the future of prices, and stimulating the reluctance to engage once more in commercial operations which constitutes the essence of the present panic. Nothing could illustrate more clearly the real vice and danger of irredeemable paper money. It is money of which, as we have before said, one or a dozen weak or inexperienced or dishonest men can change the quantity when they please, thus altering the value of all property and disarranging the financial relations of the country with the rest of the world; and nothing could better illustrate, too, the necessity of having a cool and proved financial head in charge of the treasury of a Government which has any control over the currency, or is in receipt of a large revenue from a commercial community, than Mr. Richardson's performances during the last six months.

It is not wonderful, too, in view of the Treasury performances, that a cry should be going up at the West, or should be likely, as is said, to find vent in Congress in December, for what is called "an elastic currency"; or, in other words, a currency which somebody can inflate at pleasure. Greenbacks being scarce and valuable, the West naturally would like more of them, and, seeing Mr. Richardson issuing them, thinks it would be an excellent idea to start the Government in the business on a larger scale. But there is no such thing as an "elastic currency" which is neither coin nor redeemable in coin. Elasticity is the quality of stretching out when needful, and contracting when the need is past. This redeemable paper possesses, but irredeemable paper does not and cannot. Redeemable paper is drawn from the banks whenever there is a temporary demand for more currency, and the banks are careful not to issue more than is plainly called for by the condition of business, and, when the demand is satisfied, it goes back again to the banks, either under a prudent restriction of discounts or under a demand for gold for exportation. Irredeemable paper once out does not go back, and therefore is not "elastic." There is no use in returning it to the banks; and it cannot be sent abroad. So it stays in circulation, raises prices, and leaves the pressure for money as great as ever. In other words, when it is stretched it stays stretched. If we only have the grace now to let the currency alone, gold will have to come into circulation before long, and then, if there be wisdom enough in Congress to order the Government to begin in some manner, and at some time certain, the redemption of their notes in coin, we shall have "specie payments" again, and with them an amount of experience which it is to be hoped will never be suffered to drop out of mind. But the notion that there will be "resumption" without somebody's doing something about it is a curious hallucination.

LESCURE'S SAINTE-BEUVE.

PARIS, Sept. 25, 1873.

SAINTE-BEUVE holds such a high place in the French literature of this century, and his works are so clearly destined to survive, that all details concerning his person and his long career offer a positive and permanent interest. Lately, several works have been published on him: 'Les Jeunes Années de Sainte-Beuve,' by Morand; 'Sainte-Beuve,' by Jules Levallois. I will only notice to-day 'Sainte-Beuve, from an inedited correspondence,' by M. de Lescure. This last writer is a sort of literary *raffiné*, who never grasps any vast subject, but is fond of looking into all the dark holes of past or contemporary history. He was fortunate enough to excite the curiosity and to win the favor of Sainte-Beuve; he is now preparing the 'Memoirs of a Political Apprentice,' and his relations with the great critic are only a chapter of the work which he announces.

The first works of M. de Lescure were a memoir on the once famous 'Philippiques' of Lagrange Chancel, a poetical pamphlet directed against the Regent Orléans, and various articles on the too famous ladies of the time of the Regency. He sent these to Sainte-Beuve and added a little book called 'Eux et Elles; Histoire d'un Scandale.' This last pamphlet was a sharp critique of the revelations made by Madame Sand on Alfred de Musset, of the retort of Paul de Musset against Madame Sand (Madame Sand's novel was called 'Elle et Lui,' and the reply by Paul de Musset 'Lui et Elle'). As Madame Louise Collet had seized the opportunity to write a sensational book called 'Lui,' the public soon became disgusted with these personal revelations, and gave its verdict in the short sentence "Ni lui, ni elle." Sainte-Beuve shared this sentiment, and wrote to M. de Lescure: "I have read your clever denunciation of all the *lui* and *elle*. I have admired your sagacity in discerning the true from the romantic, as I know the things of that time, and *that thing* in particular [alluding to the relations between Madame Sand and Alfred de Musset] better than anybody, having had the honor of being the confidant of both parties." This was the beginning of a literary correspondence. M. de Lescure asked Sainte-Beuve to help him in his researches on the relations of Racine with an actress, Mlle. du Parc, and Sainte-Beuve kindly looked for him among what he called his "Port Royal chips." Sainte-Beuve helped M. de Lescure again when the latter published the 'Memoirs of Mathieu Marais on the Regency'; they both liked these modest witnesses of history whom D'Argenson calls "minutists." "Can you come to me Sunday, at twelve?" writes Sainte-Beuve, one day; "I shall afterwards go to my shop (the *Constitutionnel*) to correct proof-sheets; my mind wants some tonic." He was truly fatigued with the great labor he had undertaken, the famous 'Causeries du Lundi.' A few days afterwards, he writes again to M. Lescure, who showed himself somewhat too impatient to have his 'Mathieu Marais' reviewed:

"Let me describe to you, since you are interested in it, my literary situation, not as it is seen from the outside, but as I see it from the inside. It would be a great mistake if my friends took me for a personage who has any authority, and who holds the rod in the republic of letters. I am, on the contrary, dependent upon the public. I regret often not having such moderation in my desires as would make me contented with my poverty, and allow me to choose my boon subjects. I feel like an actor obliged to play when he ought to retire, and who sees no limit to his engagement. I will confess it very low, I am a little angry; not with the public, which is only too good to me, but with society, such as it is, when a man who has been working and printing for forty years (it is the exact number) sees himself obliged to go on indefinitely, and nobody suspects that every week he makes a *tour de force*. . . . I descend into a well every Tuesday morning, and I only emerge from it on Friday evening at a late hour. I cannot give a day to my friends; I cannot go to the Academy, for want of time. I was asked to dinner by a distinguished Englishman, a member of Parliament, and I wrote to him that I could not accept his invitation; that I was not a monsieur, nor a gentleman, but a working-man by the piece and by the hour. With all this, I enjoy the advantages of my situation as I suffer from its disadvantages. I have no remorse; I break through social exactitude and regularity, and sometimes through politeness, in the rudest manner, and I do what the working-men do on the day they are paid: when I have a quarter of an hour, I amuse myself."

There is, perhaps, a little want of dignity in such complaints. Many a man has worked as hard as Sainte-Beuve, and has never accused society. Physical or mental labor is the common lot of humanity. Sainte-Beuve really thought that the state owed to a man of his eminence something which would give him *otium cum dignitate*, such as a senatorship. Some time afterwards we find him quite angry with his young friend for having written a severe censure of the heroes of the French Revolution in his 'Panthéon Révolutionnaire démoli.' This book had been highly praised by Veuillot, the head of the Clerical party, in a letter sent by Veuillot to M. de Lescure, and shown in confidence to Sainte-Beuve. Veuillot's letter seems to have put Sainte-Beuve quite beside himself. He defends Lafayette and Bailly and Madame Roland; he accuses Lescure of injustice, of falling into the common error of confounding what ought to be kept separate. "I declare to you in

my soul and conscience, you have not spoken of the men of those times as they ought to be spoken of. France needs not to *repent*, even if she has committed wrongs. A nation which goes on its way towards its destiny must not repent. Nothing is so implacable as history." What would Sainte-Beuve have said if he had seen the Commune and witnessed the execution of his friend Bonjean, and been obliged to turn back to the dynasty condemned in 1789 and in 1830?

It was still some time afterwards that Sainte-Beuve was named a senator. M. de Lescure himself accepted an office in the home department, which placed him in constant communication with some of the most important personages of the Empire, and he became also one of the confidential friends of Princess Mathilde, who had taken upon herself the patronage of the men of letters and of the artists. "We both," said M. de Lescure, in alluding to these new circumstances, "thought ourselves happy for a little while, and afterwards how often we both regretted the time when we were so unhappy." The melancholy of Sainte-Beuve appeared almost as soon as he had entered his political fetters and ceased to be a mere journalist. Sainte-Beuve made his maiden speech before the Senate in the year 1866, on the question of literary property. The Empire was still in its full power; but the Mexican campaign and the triumphs of Germany had thrown a shadow over the glories of the Crimea and of the Italian campaigns. Sainte-Beuve was a strong advocate of authority. He would have liked the Emperor to be the Louis XIV. of a new dynasty. His liberalism only revived in whatever touched the clerical question; he made two speeches in the Senate on the question of primary education, and, in the face of the bishops, he defended the university and the principle of lay education. One of his colleagues brutally interrupted him with these words: "You were not sent here for that." Sainte-Beuve was painfully sensitive, and resented this insult too keenly. He would not be looked on as a mercenary senator who was paid to vote with the Government. From that moment he began to be uncomfortable. He defended in the Senate the liberty of the press in May, 1866; spoke again in favor of the university; in his letters shows himself uneasy and discontented. "I am not a doctor, I am a part of the malady; I am a little alarmed, and I complain. I am like a man who feels the fever coming. Many feel like me." He complains of the Government, he complains of the nation. "This nation is not reasonable. The same men who would be the first sufferers if the nation followed their lead, and who have suffered once before, begin the same game over again. We pay ourselves with words."

Sainte-Beuve did not believe that the men who had been the supporters and framers of a dictatorial Empire could be good leaders in a liberal Empire, and he was afraid of the sterility of the country, of the absence of new men, of new political leaders. "The feeling and the consciousness of a great force and of an immense popularity had produced a general neglect of individuals, taken one by one." He calls the Emperor "the head of bronze," and asks what there is in it. Napoleon, who lived in a land of dreams, was, so to speak, hedged in by all the men of the 2d of December, and the publication of the papers found at the Tuileries has shown that the Government's largesses to letters and the arts were directed by those men into the most ignoble hands. Sainte-Beuve was a senator, but he had no influence. He writes once to M. de Lescure:

"My dear friend, you are near to the most powerful minister (Rouher). I do not leave my room; but I look out, and I hear and I observe. Tell your minister that, if nothing is done, all things are rapidly dissolving, and then everything will be at the mercy of the first event. Do not shake your head and smile, and seem reassured; all the powers which have fallen have done so till the eve and till the very morning of their fall. The Empire is very sick. . . . How, after the period of glory, have we entered the period of contempt? Why not boldly name a constitutional cabinet? I would not have advised it a few years ago; but now, it is perhaps our salvation. And let us quickly renew the Chamber, which is worn out, and which no longer feels the current of public opinion. In one word, to act, to act is the important thing."

M. Rouher alone read this letter, and said not a word in answer. M. de Lescure compares him to the Duc de Guise, who threw away at Blois a letter informing him of his projected assassination, saying: "They would not dare."

After he had left the *Constitutionnel*, Sainte-Beuve had published his 'Causeries' in the *Moniteur Officiel*. The managers of this paper, which since 1789 had received the communications of all governments, had a quarrel with M. Rouher, and lost their privilege. A new *Journal Officiel* was created, and the Minister asked Sainte-Beuve to remain on his staff. Sainte-Beuve refused, and, to show even better his independence, he went over to an Opposition paper, called the *Temps*. This was thought scandalous, and Sainte-Beuve fell into open disgrace. Princess Mathilde, however, did not abandon him, though she scolded him a little:

"Your eminent minister," writes Sainte-Beuve to M. de Lescure, "said some time ago that I was a man who could not be lived with. He must think and say it all the more now. He does not understand, with all his talent, what a man of letters is; with such a man the dignity of senator (since it is a dignity) is only an accident, a noble and useful accident, very essential when it arrived (as I was overworked), but something which does not touch the vital principle and the vital nerve. The official paper, as it has been reconstituted, may please others; I decided from the first day not to enter it; I have opinions, convictions, and, on some points, they are deep and fierce."

Sainte-Beuve did not long survive this rupture. only, towards the end, sent cards to M. de Lescure, with words of encouragement, while he was himself slowly dying. His funeral took place on the 13th October, 1869; he was followed to his tomb by Madame Sand, by Dumas the father and Dumas the son, by Taine, by Prévost-Paradol. He fell before the lamentable events, which brought the Empire to an inglorious end, before the siege of Paris, before the Commune. He was conscious of the coming danger, but he did not witness the catastrophe. His glory would be more pure if he had remained to the end a mere "man of letters"; his place was not among the members of an obedient senate. His natural love of truth saved him from servility, and he vindicated to the end the rights of free thought, of science, of philosophy.

Correspondence.

THE FINANCIAL FUTURE.

To the Editor of the Nation:

Sir: Writing upon finance is a good deal like the crackling of thorns under a pot, without, as Scott in another connection pithily observes, serving any such useful purpose as the boiling thereof. Still, there is one point of view which may be instructive. It is safe to say that there are not ten men, perhaps not two men, in the country who would agree as to the details of a scheme for the management of our currency. As you justly say, the advocates of expansion and contraction, of free and restricted banking, of greenbacks and national-bank currency, are equally ardent, and each interprets every event as conclusive in favor of his own theory. There can be no question that such artificial and complex machinery will never regulate itself, and as little that with the extensive and powerful private interests at work it will never, under the present system, be regulated in the interest of the whole country. The other day I met our Vice-President in the cars, and heard a plan which he had thought out to his own satisfaction as fully adequate to the case. I evaded comment by saying that the difficulty was much less what to do than how to get it done—an objection of which he was obliged to admit the force, and, moreover, that it was not provided for in his plan.

What would become of an army in which all the officers and half the privates had independent plans of campaign, and claimed the right to put them in practice? It is necessary to give one general-in-chief the absolute command, and, when he fails, to try another. This is the method we pursued during the war, and, blundering and costly as it was, I venture to say that no government or people on earth could, from a time of peace and the entire absence of military organization or recognized military talent, have more quickly found and applied the right man. The financial situation is exactly analogous. Some one mind must be trusted with the initiating power, subject, if you please, to the control of Congress, and ultimately of the country, and when he fails another must be tried. Of course, if the process is not to be infinite, it must not be at random, but with a training-ground like a battle-field, on which the claims of aspirants may be developed. The chief financial officer of the Government, the Secretary of the Treasury, is the mind, and Congress is the training-field on which the battle must be fought out. It is no matter whether the system is English or Mongolian; whether it is unconstitutional (which it is not), anti-republican, or anti-American; whether the traditions of Congress or the interests of the lobby are opposed to it. It is the only way, and the one haven which the country, when sufficiently tossed with financial tempests, will ultimately be obliged to seek.

G. B.

Boston, Oct. 11, 1873.

THE COST OF CARRYING GRAIN—ON PAPER.

To the Editor of the Nation:

Sir: Pending the calling of another meeting on the "Transportation Problem," to inform us with whose money that great freight railroad to Chicago is to be constructed, it may do some good to lay before the public an illustration of the reckless and extravagant way in which this matter is discussed.

A prominent speaker, at a recent meeting for the discussion of the cheap transportation question, is reported to have said that the freight on grain from Chicago to New York must be reduced to 14 to 16 cents per bushel. Now, let us endeavor to ascertain by reference to the results of experience the probabilities of reaching "a consummation so devoutly to be wished." The nearest approximation to a "freight" road of which we have the data is that of the Philadelphia and Reading Railroad Company, whose sworn report to the Auditor-General of Pennsylvania, for 1872, furnishes the following facts, viz.:

The cost of the road and equipment is represented by capital stock	$34,236,175 28
And by bonded and other debt	29,342,169 00
Total	$63,578,344 28
The tonnage for the year in tons of 2,000 lbs., was of coal	6,927,686 tons.
Iron ore, stone, merchandise, etc.	2,891,400 "
Company's materials, passengers, baggage, etc.	1,162,571 "
Total	10,981,657 tons.

Not including taxes, rents, interest, and cost of renewing rails, the proximate average cost per ton per mile to transport freight other than coal was $\frac{98}{100}$ of a cent, and the cost per ton per mile to transport coal was $\frac{78}{100}$ of a cent.

The grade of this road is with the load going to tide-water, so that it is said that a locomotive can take down as many loaded cars as it can take back light. It would be impossible to construct a line from Chicago to New York having such advantage of grade. About $\frac{7}{11}$ of the tonnage of the road is coal, and the *cost of transportation* has been reduced, it is believed, to the lowest possible limit under ruling rates for labor and materials.

Excluding the odd $\frac{3}{100}$ of a cent per ton per mile, and assuming that wheat can be transported as cheaply as coal, let us see what it would cost, at the rate of ¾ of a cent per ton per mile, to transport a ton of wheat from Chicago to New York.

The distance is (in round numbers) 1,000 miles; ¾ of a cent per ton per mile for 1,000 miles equals $7 50 per ton through. At 60 pounds per bushel, or 33⅓ bushels to the ton, $7 50 per ton is equivalent to 22½ cents per bushel. To reduce the cost of transportation to 15 cents per bushel, the cost per ton per mile for labor and materials must be reduced *one-third; i. e.*, the $3 per day man can be paid but $2, the $1 50 per day man but $1, and so on. This might be done, perhaps, if there could be a general return to *ante-bellum* prices, but otherwise not, as those who supply the labor and materials composing the cost of transportation could not submit to such a reduction unless their wants could be supplied at corresponding rates. In this fall in prices, grain would of course be included, and thus the reduction would bring no benefit.

It must be borne in mind that we are not now discussing the cost of roads or providing for dividends on stocks, either watered or representing merely the actual expenditure to construct the roads they represent; that is another branch of the subject, affecting another class of interests—a class, however, which must be recognized before the coveted "freight road" can be built, and a fair allowance for which must be added to the 22½ cents per bushel to compensate for use of capital, risks, taxes, renewal of rails, etc.

The lowest *contract* rates for the transportation of coal in large quantities, by rail, of which we have information, are those of the Erie Railway Company, which average fully 1½ cents per ton per mile, exclusive of the cost of loading and unloading. This is at the rate of about 45 cents per bushel of 60 lbs. for 1,000 miles.

The *cost* per ton per mile, for freight carried by the Pennsylvania Railroad Company in 1872, is reported to the Auditor-General of Pennsylvania as having been $\frac{886}{1000}$ of a cent, equal to $8 86 per ton for 1,000 miles, or $26\frac{58}{100}$ of a cent per bushel of 60 lbs. The tonnage of that road is given as 7,844,779 tons for 1872, and its capital and debt, representing the cost of the road and equipment, as $86,000,000.

Referring to the experience of a company transporting large quantities of coal by water, we find that the Delaware and Hudson Canal Company, which last year transported 1,400,000 tons, nearly, over its canal, is now paying its boatmen 90 cents per gross ton for 108 miles, exclusive of loading and unloading, equal to $\frac{833}{1000}$ of a cent per ton per mile, or nearly 22½ cents per bushel of 60 lbs. for 1,000 miles. This sum simply pays the boatmen's wages and running expenses, together with the repairs and wear and tear of the boat. It affords nothing for interest on cost of canal or for canal repairs and superintendence.

In view of these facts, we think it may reasonably be inferred that it will be many years before the *cost* of transportation of a bushel of wheat from Chicago to New York can be reduced as low as 20 cents, much less to 14 to 16 cents.

M. D.

New York, Oct. 10.

Notes.

G. P. PUTNAM'S SONS have in press 'The Challenge Cup,' a nautical poem descriptive of the five races for the international cup of 1851, won by the yacht *America*. It will be illustrated with photographs of the contesting yachts and diagrams of the races, and will make a handsome quarto volume.—On Tuesday, the 21st instant, there will be dedicated at Lafayette College a new building erected for the Scientific Department, and called Pardee Hall, after the founder of that department, Mr. Ario Pardee. The cost of this edifice exceeded $250,000, and the greatest pains appear to have been taken to make it commodious and attractive.——A. D. F. Randolph & Co. have in press Dr. Samuel Irenæus Prime's new volume of Continental travel, entitled 'The Alhambra and the Kremlin—the South and the North of Europe.'

—A reader of the *Nation* having lately asked of us a reference to some authoritative statement of the height of Napoleon I., we present the following extract from M. de Bourrienne's 'Memoirs of Napoleon Bonaparte' (vol. i., p. 7, English edition; Glasgow: Blackie & Son). Bourrienne was a fellow-student with Bonaparte at the military school of Brienne, concerning which Marshal Ségur, when Minister of War in 1783, made this record (MS. Coll., art. School of Brienne): "State of the king's scholars eligible from their age to enter into the service, or to pass to the school at Paris; to wit, M. de Buonaparte (Napoléon), born Aug. 15, 1769, in height 4 feet 10 inches 10 lines [5 feet 6½ inches English]; has finished his fourth season, etc." It is clear that the translator, in reducing the French to the English measure, has made an error, as the result gives a stature not noticeably short. The old French foot was nearly the equivalent of 1·066 English feet; there were twelve inches to the foot, and twelve lines to the inch. This ratio shows the height of the Little Corporal to have been only 5 feet 2·7 inches, which answers very well to the common idea of him.

—Some complaint has been made because the Metropolitan Art Museum just opened offers but one free day to the public, instead of several, or instead of being wholly free. That the public has no reason to be dissatisfied with the present arrangement, however, a glance at the finances of the institution will show. It has, with the exception of the sale of admission tickets, absolutely no source of revenue with which to defray the charges for rent, heating, watching, and fire insurance (a very heavy item). The fitting-up of the Museum, the purchase of cases, etc., required a large outlay of money; and, up to this time, the whole expense has been borne by the subscribers, with the exception of $15,000 appropriated by the Board of Apportionment, but expended almost in advance in preparing the new building. In like manner, the paintings of the old masters have been purchased out of the funds subscribed for the establishment of the Association, while the greater part of the modern paintings and art-objects lent to the Museum for exhibition belong to members of the board of trustees, some of whom were amongst the most liberal subscribers to the original fund. The public can hardly expect these gentlemen to go on for ever emptying their pockets and, even more liberally, bestowing their time on the enterprise—how liberally, only those know who have been intimately connected with it. There are other citizens of equal means, and not more actively engaged in business, who may properly be urged to share the generous burden, and hasten the time when the directors of the Museum can make it, as they would have it, practically free to all. The city authorities are lending their hearty co-operation to the erection of the permanent buildings in Central Park, but it must of necessity be several years before they can be made ready for occupation. Meantime, the temporary quarters on Fourteenth Street can be turned to excellent account as an educational storehouse, if the needed support is forthcoming. We doubt if it is generally understood that the Cesnola Collection is still the individual property of one of the trustees of the Museum, whose prompt and generous action secured it for this country. Yet such is the fact, and very little progress has been made towards raising the amount required to repurchase it, although the relinquishing of such a prize is not to be thought of, and the Museum should by all means be enabled to avail itself of the further discoveries of General di Cesnola in the same line, he having returned to his excavations in Cyprus.

—The first art college established in an American university took being on the 18th ultimo, when a Fine Arts Department was opened at Syracuse. Two courses are organized at present, architecture and painting, with which the faculty will undoubtedly find their hands full; sculpture is not yet talked about, nor is room made for any fine art addressed to the ear, except "elocution." The scheme, thus restricted to principles of design, includes those studies which give scope and intelligence to design, such as chemistry and photography, mathematics, history, æsthetics, and languages. It is truly

cheering to be promised a breed of artists who shall not be remarkable for complete ignorance of things connected with a liberal education, and Syracuse is invoked by a quack-ridden world to make all convenient haste in supplying a few practitioners with brains developed all around, like those of the great Italian painters, or, failing that, to produce a man capable of putting up a simple iron building on Broadway without any solecisms. The architectural course, we are a little surprised to observe, seems to start upon a German basis, no consciousness being betrayed of what we take for a proved fact, that the literary sinews of architectural study are in the French language *par excellence;* the Freshman, Sophomore, and Senior years are to be passed, it seems, without any French, the lessons in which tongue only occur two or three times a week in the Junior year. A corresponding hesitation in adopting the fruits of French study is seen in the painting course; and we imagine the college will find this attempt to pursue art-culture with economy of French to be a little like trying to climb a mountain with economy of air. The whole experiment, however, is a novelty. It will be watched with deep interest; and we think it not unreasonable to hope that, especially in the department of architecture, some solid results will follow upon skilled training; it is, of all the arts, most like a science, and has the largest ingredient of calculation and common sense. In painting, the institution will have, if it succeeds, a yet greater and more unexpected triumph. Though we have not a grain of faith in the divine ignorance of the artist as a condition of the sublime, yet we wait for the issue here with some little shade of scepticism which we shall be glad to see the future remove. Pedantry, dear to science, is most insupportable in art, and nothing would be gained by the bursting upon the world of numerous painters always ready to execute as it were prize poems with their brushes. American youths, as the practical comparison with foreign schools will show, are fully as apt in design as those of any country. It remains to be seen whether rigid college study is the due preparation for an exquisite art-sense—a preparation which is not so much like hammering to a highway as like sunshine to a plant. Tieing the mind to the difficult æsthetic thread, so elusive and so hard to trace, is what we take to be the true method in art-study, not confidence in rules, which leads to a bad state of intellectual repose. The successful European schools depend above all upon the personal magnetism of the great artists who conduct them. It is surprising how adroitly these men of genius shun the college tendency to rest in pedantry, precedent, boredom, and ennui. They watch their classes with pride and care, in the hope of founding a propaganda, working for nominal salaries, to the detriment of their personal affairs. The art-idea springs up quickly between them and their pupils, as a language springs up between babe and nurse. There are not observable among the professors at Syracuse men who have made a mark in the practice of art, but doubtless they are selected for their competency. We observe with admiration that landscape and portrait are taught by one gentleman, irresistibly carrying the thoughts back to Titian, the last painter known to have excelled in those branches equally. The Dean of the Faculty is George F. Comfort, A.M., an enthusiastic student of æsthetics for many years. To him and his fellow-professors belongs the critical task of proving what has not yet been proved: whether a college, that capital machine for teaching a science, is a good machine for teaching an art.

—The discussion of "Darwinism" by the Philosophical Section of the Evangelical Alliance, if not brilliant, is in some respects satisfactory. It shows that the divines are beginning to perceive what they ought to decry, and what not. When President McCosh declares "it is useless [he might have said foolish] to tell the younger naturalists that there is no truth in the doctrine of development, for they know that there is truth, which is not to be set aside by denunciation"; when he intimates that religion may have neither title nor interest to insist that species have not developed from other species, in an advance from age to age, from lower to higher forms—and by his silence leads us to infer the same of science; and when again such a champion of orthodoxy as Dr. Hodge, of Princeton, pertinently affirms that "the great question which divides theists from atheists, Christians from unbelievers, is this: Is development an intellectual process guided by God, or is it a blind process of unintelligible, unconscious force, which knows no end and adopts no means?" we may safely conclude that the time draws nigh when scientific hypotheses of the origin of species will be left to stand or fall upon their own merits, or at least be denounced with discrimination and some regard for the consequences. Dr. Hodge got his answer from a divine of his own denomination, who is also a botanist, a Rev. Dr. Brown, grandson of the doughty John Brown of Haddington—whose praise is in all the Calvinistic churches. He informed the audience that he unhesitatingly accepted the theory of development as a working hypothesis, and succinctly gave the reasons for doing so; and that he none the less held "the views advanced in the Shorter Catechism issued by the Westminster Assembly of Divines," enumerating the thirteen principal points in succession, adding that, while he did not hold "that God created all things out of nothing in the space of six days," the development doctrine was not responsible for the abandonment of that dogma. Finally, he ventured to anticipate "that the confirmation or general adoption of the hypothesis of development will ultimately exercise a beneficial influence on religion." The only note of a contrary tenor, so far as the daily report shows, was from Dr. Dawson, who appears still to hold that the Darwinian theory logically leads to atheism; that, "as regards varieties, Darwin is well enough; but, as regards species, I don't believe in it, because it comes in contact with the Bible." He has to draw the line somewhere, so he draws it at species. As to natural selection, "it is not science at all—only a bad philosophy." This is said of what an older naturalist (as quoted in another article, in which we have already referred to Dr. Dawson's view) declares to be neither a theory nor an hypothesis, but the expression of a necessary fact.

—The *Saturday Review* has collected a number of prophecies as to mundane affairs made by well-known characters which have been actually verified by the event, and suggests that a general collection of such prophecies might be brought together in a book, to be called "Secular Prophecy Fulfilled." Arthur Young, like Rousseau, predicted the French Revolution (which Dr. Moore, the author of 'Zeluco,' who travelled in France just before its outbreak, did not foresee at all). Lord Chesterfield made the same prophecy. Cobbett predicted the secession of the Southern States. Most remarkable of all, Heine predicted not only that France and Germany would fight, but that France would be utterly put down; that the line of fortifications which Thiers was at the time of the prophecy building around Paris would draw to the capital a great hostile army which would crush the city, and that the Communists would some day get the upper hand in Paris; that they would strike in a spirit of fiendish rage at the statues, the beautiful buildings, and all the other tangible marks of the civilization they sought to destroy; and that they would throw down the Vendôme Column. As the *Saturday Review* points out, these predictions, though they seem almost a proof of inspiration, are really only remarkable evidences that the men who made them thoroughly understood the strength of certain tendencies of their times. There are always a number of men in every generation who have this gift of prophecy, which seems to the vulgar mind miraculous now, just as the prediction of an eclipse seemed miraculous in the days of Columbus. In the early ages of the world, the gentlemen who had this gift went about lifting up their voice and prophesying, or delivering oracles, or attuning their voices to the lyre. Now, as the *Saturday Review* points out, they edit newspapers, and vaticinate more voluminously, more confidently and explicitly, than Jeremiah or Isaiah. They do, indeed, interfere more directly than the early seers in the daily life of their fellow-citizens; but they also do it more beneficently, as in the recent instance of the depression of gold, produced by the efforts of the *World* and the *Evening Mail*. We may notice, also, the fact that the *Liberal Thinker* prophesied, two years ago, the present financial difficulties, and even was able to predict the explosion of the Northern Pacific bubble. George Francis Train predicted both even more circumstantially. An almost equally interesting collection might be made of unfulfilled prophecies made by men of real sagacity—as, for instance, that the United States could not keep together more than a generation (which, if we remember right, was the privately expressed opinion of the elder Adams); that gold would never fall below 150, which was the belief of a number of prominent financiers in this country a few years ago, and so on. The failures as well as the successes can be explained on rational principles—they being generally caused by forgetfulness of some general tendency which, after the event, is manifest enough.

—It seems a little singular, considering what a genial disposition we generally exhibit towards foreign celebrities, that Mr. Gerald Massey's arrival on these shores has attracted so little attention. The public, perhaps, does not know who and what Mr. Gerald Massey is, but certainly ought to know, if we may rely upon the glowing account of him lately given in the columns of the *World* by one Byron Webber, who wrote to herald his arrival. Mr. Massey is a bard who, as early as the fiery days of 1848, in the pauses of the conflict between might and right, compelled men to listen to his burning words, and gave evidence that beneath these there were depths whereof his rivals gave no hint. In 1851, Dr. Samuel Smiles placed a high estimate upon his work, but Mr. Webber doubts whether Dr. Smiles "had even an approximate conception of its potentiality." Besides this, he is a *Quarterly Reviewer;* he has triumphantly solved the mystery of Shakespeare's sonnets, "and his place among the English essayists is by the side of Lamb and Hazlitt, and Macaulay and Ruskin." Mr. Webber says that, "just to begin at the beginning," he will mention that Mr. Massey was born at Tring, in Hertfordshire, in 1828. Fortunately for the world, he had a hard life as a child, and burst into song at the age of nineteen. The tyranny he

had undergone and witnessed as an errand-boy, Mr. Webber says, gave a political bias to his studies, and he became a bard of the people—a Red Republican and a Christian Socialist. This was in the fiery days of 1848. Still, it was a rough struggle with Mr. Massey for many years, till one day a happy accident occurred. One wet morning, as Mr. Hepworth Dixon, editor of the *Athenæum*, was walking along Gray's Inn Lane, he saw in a window a copy of a paper called the *Red Republican*, the letters of the heading, most vigorously and artistically drawn by W. J. Linton, being composed of daggers, spikes, and spears. These implements of death so fascinated Mr. Dixon that he stood in the wet, his eyes riveted upon the sheet (edited by Julian Harney), and in the last corner of the last page he found a poem called "The Song of the Red Republican," by Gerald Massey, beginning with the glowing words:

> "Fling out the red banner, its fiery front under
> Come gather ye, gather ye, champions of right!
> And roll round the world with the voice of God's thunder
> The wrongs we've to reckon, oppressions to smite."

This was a fortunate day for Mr. Massey; for Mr. Hepworth Dixon had discovered a new poet, and when 'Babe Christabel and other Poems' appeared, he blazoned forth the fact to the world in seven columns of the *Athenæum*. Douglas Jerrold also reviewed 'Babe Christabel' enthusiastically in *Lloyd's Newspaper*. Mr. Massey was, however, unfortunate in his publishers, and his being a Spiritualist was against him; but his acquaintance with Mr. Dixon ripened into close literary friendship and association. He joined the staff of the *Athenæum*, and "for about ten years of Mr. Dixon's editorship wrote the greater part of the reviews of poetry which appeared in that journal." The instructions as to reviewing which he received from Mr. Dixon deserve to be written in letters of gold; they were, "Be just; be generous; but when you do find a deadly ass, sling him up." Mr. Massey is now engaged on what he hopes to make his *magnum opus*. He has for some time past "been diving down to the origin of symbolism, and making out the meaning of the myths." He finds that "a great deal supposed to be lost can be reidentified, and thinks he has touched bottom in the fore-world, and found a bit of pavement which must have been laid by the earliest thinkers who created the myths." The title of the book is to be 'Myths and Mysteries Interpreted for Men.' Recent writers, Mr. Webber says, who have been exulting in the supposition that Mr. Massey's republican and revolutionary ideas have vanished, know nothing about the matter. Of course he is not likely to go over the old ground of 1848; but his future work is likely to be as much stronger than the older "as twenty-five years of grasping, intensifying rootage during that time is bound to make it."

—Perhaps some of our readers who recall a notice of an anonymous translation from the Persian of Omar Khayyam into English verse which appeared in our columns rather more than two years ago (in No. 322), may care to hear that copies, at that time very scarce, are now to be had from the publisher, Bernard Quaritch, Piccadilly, London. A third edition of this remarkable poem has been issued. On comparison with the second, we find certain verbal changes, most, though not all, being improvements. The arrangement of the quatrains, too, has been slightly altered. A certain number have been omitted; for instance, those numbered XIV., XXVIII., XCIX., CVII. Of the alterations, this may serve as a sample; it is No. CVI. in the old edition, where it read as follows:

> "Oh! if the world were but to re-create,
> That we might catch ere closed the book of fate,
> And make the writer on a fairer leaf
> Inscribe our names or quite obliterate!"

which, as amended, stands:

> "Would but some wingèd angel ere too late
> Arrest the yet unfolded roll of fate,
> And make the stern recorder otherwise
> Enregister, or quite obliterate!"

This is hardly an improvement. Another case of change without bettering is in this version of No. XLIX. of the former edition:

> "A moment's halt—a momentary taste
> Of BEING from the well amid the waste—
> And lo! the phantom caravan has reached
> The NOTHING it set out from—oh! make haste!"

As it stood it was much more impressive; it then ran:

> "One moment in annihilation's waste,
> One moment of the well of life to taste—
> The stars are setting, and the caravan
> Draws to the dawn of nothing—oh! make haste!"

We may, however, admit that these are improvements if made, as they apparently were, in order to bring out more clearly and exactly the meaning of the original, even with a consciousness of diminishing the beauty of the poetic imagery.

—The most notable of recent Italian publications is certainly Gen. La Marmora's 'Un po' più di luce sugli eventi politici e militari dell' anno 1866.' We purpose reviewing it hereafter at some length, and need only remark now that it is the product of the wounded susceptibilities of the author, which have not been spared by the Germans, and that in his attempt to throw light on the events of 1866 and vindicate his generalship and his loyalty at Custoza, he publishes private letters and telegrams which will render it extremely difficult for some of Italy's representatives to remain at or to return to certain foreign courts. The battle of Custoza and the preliminaries of the war of 1866 have also been treated in a very thorough and painstaking manner by Captain L. Chiala, the last part of whose work ('Cenni storici sui preliminari della guerra del 1866 e sulla battaglia di Custoza') appeared just after La Marmora's pamphlet. The high praise which the 'Cenni storici' has received is qualified by doubts as to Chiala's accuracy in computing the number of troops on either side, and the losses; the disparity of forces having probably been in favor of the Italians and not of the Austrians, as he represents. Perhaps we should say his method is questioned rather than his accuracy, for when we come to the actual numbers engaged, the defeat cannot be called inglorious for Italian valor. The previous stage in the liberation of the peninsula has been treated in a new Life of Cavour, which was to have been published October 1, the day of the unveiling of the Cavour monument at Turin. The author, Massari, was an intimate friend of the great premier, and formerly editor of the official *Gazzetta Piemontese*. The biography has been written with some reserve, out of regard for the living. Von Treitschke's 'Count Cavour' has been translated into Italian by A. Guerrieri-Gonzaga. Prof. Angelo De Gubernatis appears once more as an industrious and learned archæologist in his popular account of Indo-European funeral rites ('Storia popolare degli usi funebri indo-europei'). An Eastern sketch-book ('Ricordi d'architettura orientale, presi del vero') by Giuseppe Castellazzi, a meritorious pupil of the Academy of Architecture at Venice, gives the fruitful results of a year's excursion among Oriental monuments, in lithographic drawings from the author's own hand. An interesting monograph on one of the most eventful battle-grounds in all Italy, perhaps in Europe—Treviglio and the adjoining territory, in which every village has given a name to a battle—is Dr. Carlo Casati's 'Treviglio di Ghiara d'Adda e il suo territorio.' Higher up on the river Adda is Sondrio, the headquarters of the Italian Alpine Club, of which a learned committee has prepared a 'Guide to the Valtellina and its Mineral Waters,' with historical and scientific notes, making a work of no common order. A somewhat ponderous but valuable and not uninteresting contribution to the early history of Genoa is Giacomo Lumbroso's 'Sulla storia dei Genovesi avanti il MC.' The mention in it of a public seal stamped *Januensis civitas*, recalls the Anglicized form of "Janway" for "Genoese" in use as late as the time of Henry VIII. (*v.* p. 337 *Nation*, vol. xii.) Finally, we may notice the publication at Rome of a weekly *Giornale delle Colonie*, whose establishment marks the extent and importance of Italian emigration. It is a singular fact that while the growth of the German marine is directly traceable to emigration, particularly to the United States, Italy has no corresponding advantage to show for peopling other lands. Indeed, her commerce has gained no appreciable development from the opening of the Suez Canal and the piercing of the Mt. Cenis—works in which Italians performed the heaviest labor; and but for the activity of the Riviera of Genoa, the navigation statistics of the kingdom would present exactly the same aspect as in 1859.

THE ATTITUDE OF WORKING NATURALISTS TOWARDS DARWINISM.*

THAT homely adage, "What is one man's meat is another man's poison," comes to mind when we consider with what different eyes different naturalists look upon the hypothesis of the derivative origin of actual specific forms, since Mr. Darwin gave it vogue and vigor and a *raison d'être* for the present day. This latter he did, not only by bringing forward a *vera causa* in *the survival of the fittest* under changing circumstances—about which the question among naturalists mainly is how much it will explain, some allowing it a restricted, others an unlimited operation—but also by showing that the theory may be made to do work, may shape and direct investigations, the results of which must in time tell us whether the theory is likely to hold

good or not. If the hypothesis of natural selection and the things thereto appertaining had not been capable of being put to useful work, although, like the 'Vestiges of the Natural History of Creation,' it might have made no little noise in the world, it would hardly have engaged the attention of working naturalists as it has done. We have no idea even of opening the question as to what work the Darwinian theory has incited, and in what way the work done has reacted upon the theory; and least of all do we like to meddle with the polemical literature of the subject, already so voluminous that the German bibliographers and booksellers make a separate class of it. But two or three treatises before us, of a minor or incidental sort, suggest a remark or two upon the attitude of mind towards evolutionary theories taken by some of the working naturalists.

Mr. Darwin's own expectation, that his new presentation of the subject would have little or no effect upon those who had already reached middle-age, has—out of Paris—not been fulfilled. There are, indeed, one or two who have thought it their duty to denounce the theory as morally dangerous, as well as scientifically baseless; a recent instance of the sort we may have to consider further on. Others, like the youth at the river's bank, have been waiting in confident expectation of seeing the current run itself dry. On the other hand, a notable proportion of the more active-minded naturalists had already come to doubt the received doctrine of the entire fixity of species, and still more that of their independent and supernatural origination. While their systematic work all proceeded implicitly upon the hypothesis of the independence and entire permanence of species, they were perceiving more or less clearly that the whole question was inevitably to be mooted again, and so were prepared to give the alternative hypothesis a dispassionate consideration. The veteran Lyell set an early example, and, on a reconsideration of the whole question, wrote anew his famous chapter and reversed his former and weighty opinion. Owen, still earlier, signified his adhesion to the doctrine of derivation in some form, but apparently upon general, speculative grounds; for he repudiated natural selection, and offered no other natural solution of the mystery of the orderly incoming of cognate forms. As examples of the effect of Darwin's 'Origin of Species' upon the minds of naturalists who were no longer young, and whose prepossessions, even more than Lyell's, were likely to bias them against the new doctrine, two from the botanical side are brought to our notice through recent miscellaneous writings which are now before us.*

Before the publication of Darwin's first volume, M. Alphonse De Candolle had summed up the result of his studies in this regard, in the final chapter of his classical 'Géographie Botanique Raisonnée,' in the conclusion that existing vegetation must be regarded as the continuation, through many geological and geographical changes, of the anterior vegetations of the world; and that consequently the present distribution of species is explicable only in the light of their geological history. He surmised that, notwithstanding the general stability of forms, certain species or quasi-species might have originated through diversification under geographical isolation. But, on the other hand, he was still disposed to admit that even the same species might have originated independently in two or more different regions of the world; and he declined as unpractical and unavailing all attempts to apply hypotheses to the elucidation of the origin of species. Soon after Darwin's book appeared, De Candolle had occasion to study systematically a large and wide-spread genus—that of the oak. Investigating it under the new light of natural selection, he came to the conclusion that the existing oaks are all descendants of earlier forms, and that no clear line can be drawn between the diversification which has resulted in species and that which is exhibited in races and minor varieties.

And now, in the introductory chapter of the volume of essays before us, he informs us that the idea which pervades them all, and in some sort connects very diverse topics, is that of considering this principle of selection. Of the principle itself, he remarks that it is neither a theory nor an hypothesis, but the expression of a necessary fact; that to deny it is very much like denying that round stones will roll down hill faster and further than flat ones; and that the question of the present day in natural history is not whether there be natural selection, or even whether forms are derived from other forms, but to comprehend how, in what proportions, and by what means hereditary deviations take place, and in what ways an inevitable selection takes effect upon these. In two of these essays natural selection is directly discussed in its application to the human race; the larger one dealing ably with the whole subject, and with results at first view seemingly in a great degree negative, but yet showing that the supposed "failure of natural selection in the case of man" was an unwarrantable conclusion from too limited a view of a very complicated question. The article abounds in acute and fertile suggestions, and its closing chapter, "on the probable future of the human species" under the laws of selection, is highly interesting and noteworthy. The other and shorter essay discusses a special point, and brings out a corollary of the law of heredity which may not have been thought of before, but which is perfectly clear as soon as it is stated. It explains at once why contagious or epidemic diseases are most fatal at their first appearance, and less so afterwards: not by the dying out of a virus—for when the disease reaches a new population, it is as virulent as ever (as, for instance, the small-pox among the Indians)—but by the selection of a race less subject to attack through the destruction of those that were more so, and the inheritance of the comparative immunity by the children and the grandchildren of the survivors; and how this immunity itself, causing the particular disease to become rare, paves the way to a return of the original fatality; for the mass of such population, both in the present and the immediately preceding generation, not having been exposed to the infection, or but little exposed, has not undergone selection, and so in time the proportion liable to attack, or to fatal attack, gets to be as large as ever. The greater the fatality, especially in the population under marriageable age, the more favorable the condition of the survivors; and by the law of heredity, their children should share in the immunity. This explanation of the cause, or of one cause, of the return of pests at intervals no less applies to the diminution of the efficacy of remedies, and of preventive means, such as vaccination. When Jenner introduced vaccination, the small-pox in Europe and European colonies must have lost somewhat of its primitive intensity by the vigorous weeding out of the more susceptible through many generations. Upon the residue, vaccination was almost complete protection, and, being generally practised, small-pox consequently became rare. Selection thus ceasing to operate, a population arises which has not been exposed to the contagion, and of which a considerable proportion, under the common law of atavism, comes to be very much in the condition of a people invaded for the first time by the disease. To these we may infer vaccination would prove a less safeguard than to their progenitors three or four generations before.

Mr. Bentham is a veteran systematic botanist of the highest rank and widest knowledge. He had not, so far as we know, touched upon questions of origination in the ante-Darwinian era. The dozen of Presidential addresses delivered at anniversary meetings of the Linnean Society, from his assumption of the chair in the year 1862 down to the current year—each devoted to some topic of interest—and his recent 'Memoir on Compositæ,' summing up the general results of a revision of an order to which a full tenth of all higher plants belong, furnish apt examples both of cautious criticism, conditional assent (as becomes the inaugurator of the quantification of the predicate), and of fruitful application of the new views to various problems concerning the classification and geographical distribution of plants. In his hands the hypothesis is turned at once to practical use as an instrument of investigation, as a means of interrogating nature. In the result, no doubt seems to be left upon the author's mind that the existing species of plants are the result of the differentiation of previous species, or at least that the derivative hypothesis is to be adopted as that which offers the most natural, if not the only, explanation of the problems concerned. Similar conclusions reached in this country, from a study of the relations of its present flora with that which in earlier ages occupied the arctic zone, might also be referred to.

An excellent instance of the way in which the derivative hypothesis is practically applied in these days by a zoölogist is before us in Professor Flower's modest and admirable paper on the Ungulata, or hoofed animals, and their geological history. We refer to it here, not so much for the conclusions it reaches or suggests, as to commend the clearness and the impartiality of the handling, and the sobriety and moderation of the deductions. Confining himself "within the region of the known, it is shown that at least in one group of animals the facts which we have as yet acquired point to the former existence of various intermediate forms, so numerous that they go far to discredit the view of the sudden introduction of new species." "The modern forms are placed along lines which converge towards a common centre." The gaps between the existing forms of the odd-toed group of ungulates (of which horses, rhinoceroses, and tapirs are the principal representatives) are mostly bridged over by palæontology, and somewhat the same may be said of the even-toed group, to which the ruminants and the porcine genus belong. "Moreover, the lines of both groups to a certain extent approximate, but, within the limits of our knowledge, they do not meet." "Was the order according to which the introduction of new forms seems to have taken place since the eocene then entirely changed, or

*Since this article was in type, noteworthy examples of appreciative scientific judgment of the derivative hypothesis have come to hand: 1. In the opening address to the Geological Section of the British Association, at its recent meeting, by its president, the veteran Phillips, perhaps the oldest surviving geologist after Lyell; and, 2. that of Professor Allman, President of the Biological Section. The first touches the subject briefly, but in the way of favorable suggestion; the second is a full and discriminating exposition of the reasons which seem to assure at least the provisional acceptance of the hypothesis as a guide in all biological studies, "a key to the order and hidden forces of the world of life."

did it continue as far back as the period when these lines would have been gradually fused in a common centre?"

Facts like these, which suggest grave diversification under long lapse of time, are well supplemented by those which essentially demonstrate a slighter diversification of many species over a wide range of space—whether into species or races depends partly upon how the naturalist uses these terms, partly upon the extent of the observations or luck in getting together intermediate forms. The researches of Professor Baird upon the birds of this continent afford a good illustration. A great number of our birds which have been, and must needs have been, regarded as very distinct species, each mainly with its own geographical area, are found to mingle their characters along bordering lines; and the same kinds of differences (of coloration, form, or other) are found to prevail through the species of each region, thus impressing upon them a geographical facies. Upon a submergence of the continent, reducing these several regions to islands sufficiently separated, these forms would be unquestioned species.

Considerations such as these, of which a few specimens have now been adduced (not general speculations, as the unscientific are apt to suppose), and trials of the new views, to see how far they will explain the problems or collocate the facts they are severally dealing with, are what have mainly influenced working naturalists in the direction of the provisional acceptance of the derivative hypothesis. They leave to polemical speculators the fruitless discussion of the question whether all species came from one or two, or more; they are trying to grasp the thing by the near, not by the further end, and to ascertain, first of all, whether it is probable or provable that present species are descendants of former ones which were like them, but less and less like them the further back we go.

And it is worth noting that they all seem to be utterly unconscious of wrongdoing. Their repugnance to novel hypotheses is only the natural and healthy one. A change of a wonted line of thought is not made without an effort, nor need be made without adequate occasion. Some courage was required of the man who first swallowed an oyster from its shell; and of most of us the snail would still demand more. As the unaccustomed food proves to be good and satisfying, and also harmless, we may come to prefer it. That, however, which many good and eminent naturalists find to be healthful and reasonable, and others innocuous, a few still regard as most unreasonable and harmful. At present, we call to mind only two who not only hold to the entire fixity of species as an axiom or a confirmed principle, but also as a dogma, and who maintain, either expressly or implicitly, that the logical antithesis to the creation of species as they are is not by law (which implies intention), but by chance. A recent book by one of these naturalists, or rather, by a geologist of eminence, the 'Story of the Earth and Man,' by Dr. Dawson, is now before us. The title is too near that of Guyot's 'Earth and Man,' with the publication of which popular volume that distinguished physical naturalist commenced his career in this country; and such catch-titles are a sort of trade-mark. As to the nature and merits of Dr. Dawson's work, we have left ourselves space only to say: 1. That it is addressed *ad populum*, which renders it rather the more than less amenable to the criticisms we may be disposed to make upon it. 2. That the author is thoroughly convinced that no species or form deserving the name was ever derived from another, or originated from natural causes; and he maintains this doctrine with earnestness, much variety of argument and illustration, and no small ability; so that he may be taken as a representative of the view exactly opposed to that which is favored by those naturalists whose essays we have been considering, to whom, indeed, he stands in marked contrast in his spirit and method, being greatly disposed to argue the question from the remote rather than the near end. 3. And, finally, he has a conviction that the evolutionary doctrines of the day are not only untrue, but thoroughly bad and irreligious. This belief and the natural anxiety with which he contemplates their prevalence may excuse a certain vehemence and looseness of statement which were better avoided, as where the geologists of the day are said to be "broken up into bands of specialists, little better than scientific banditti, liable to be beaten in detail, and prone to commit outrages on common sense and good taste which bring their otherwise good cause into disrepute"; and where he despairingly suggests that the prevalence of the doctrines he deprecates "seems to indicate that the accumulated facts of our age have gone altogether beyond its capacity for generalization, and, but for the vigor which one sees everywhere, it might be taken as an indication that the human mind has fallen into a state of senility."

This is droll reading, when one considers that the "evolutionist" is the only sort of naturalist who has much occasion to employ his "capacity for generalization" upon "the accumulated facts" in their bearing upon the problem of the origin of species, since the "special creationist," who maintains that they were supernaturally originated just as they are, by the very terms of the doctrine places them out of the reach of scientific explanation. Again, when one reflects upon the new impetus which the derivative hypothesis has given to systematic natural history, and reads the declaration of a master in this department (the President of the Linnean Society) that Mr. Darwin "has in this nineteenth century brought about as great a revolution in the philosophic study of organic nature as that which was effected in the previous century by the immortal Swede," it sounds oddly to hear from Dr. Dawson that "it obliterates the fine perception of differences from the mind of the naturalist, . . . destroys the possibility of a philosophical classification, reducing all things to a mere series, and leads to a rapid decay in systematic zoölogy and botany, which is already very manifest among the disciples of Spencer and Darwin in England." So, also, "It removes from the study of nature the ideas of final cause and purpose"—a sentence which reads curiously in the light of Darwin's special investigations, such as those upon the climbing of plants, the agency of insects, etc., in the fertilization of blossoms, and the like, which have brought back teleology to natural science, wedded to morphology and already fruitful of discoveries.

The difficulty with Dr. Dawson here is (and it need not be underrated) that apparently he cannot as yet believe an adaptation, act, or result to be purposed the apparatus of which is perfected or evolved in the course of nature—a common but a crude state of mind on the part of those who believe that there is any originating purpose in the universe, and one which, we are sure, Dr. Dawson does not share as respects the material world until he reaches the organic kingdoms, and there, possibly, because he sees man at the head of them—of them, while above them. However that may be, the position which Dr. Dawson chooses to occupy is not left uncertain. After concluding, substantially, that those "evolutionists" who exclude design from nature thereby exclude theism, which nobody will deny, he proceeds (on p. 348) to give his opinion that the "evolutionism which professes to have a creator somewhere behind it" . . . "is practically atheistic," and, "if possible, more unphilosophical than that which professes to set out from absolute and eternal nonentity," etc.

There are some sentences which might lead one to suppose that Dr. Dawson himself admitted of an evolution "with a creator somewhere behind it." He offers it (p. 320) as a permissible alternative that even man "has been created mediately by the operation of forces also concerned in the production of other animals"; concedes that a just theory "does not even exclude evolution or derivation, to a certain extent" (p. 341); and that "a modern man of science" may safely hold "that all things have been produced by the Supreme Creative Will, acting either directly or through the agency of the forces and materials of his own production." Well, if this be so, why denounce the modern man of science so severely upon the other page merely for accepting the permission? At first sight, it might be thought that our author is exposing himself in one paragraph to a share of the condemnation which he deals out in the other. But the permitted views are nowhere adopted as his own; the evolution is elsewhere restricted within specific limits; and as to "mediate creation," although we cannot divine what is here meant by the term, there is reason to think it does not imply that the several species of a genus were mediately created, in a natural way, through the supernatural creation of a remote common ancestor. So that his own judgment in the matter is probably more correctly gathered from the extract above referred to and other similar deliverances, such as that in which he warns those who "endeavor to steer a middle course, and to maintain that the Creator has proceeded by way of evolution," that "the bare, hard logic of Spencer, the greatest English authority on evolution, leaves no place for this compromise, and shows that the theory, carried out to its legitimate consequences, excludes the knowledge of a Creator and the possibility of his work."

Now, this is a dangerous line to take. Those defenders of the faith are more zealous than wise who must needs fire away in their catapults the very bastions of the citadel in the defence of outposts that have become untenable. It has been and always will be possible to take an atheistic view of nature, but far more reasonable from science and philosophy only to take a theistic view. Voltaire's saying here holds true: that if there were no God known, it would be necessary to invent one. It is the best, if not the only, hypothesis for the explanation of the facts. Whether the philosophy of Herbert Spencer (which is not to our liking) is here fairly presented, we have little occasion and no time to consider. In this regard, the close of his article No. 12 in the *Contemporary Review* shows, at least, his expectation of the entire permanence of our ideas of cause, origin, and religion, and predicts the futility of the expectation that the "religion of humanity" will be the religion of the future, or "can ever more than temporarily shut out the thought of a Power, of which humanity is but a small and fugitive product, which was in its course of ever-changing manifestation before humanity was, and will continue through other manifestations when

humanity has ceased to be." If the philosophy of the unknowable of the Infinite may be held in a merely quasi-theistic or even atheistic way, were not its ablest expounders and defenders Hamilton and Dean Mansel? One would suppose that Dr. Dawson might discern at least as much of a divine foundation to nature as Herbert Spencer—might recognise in this power that "something not ourselves that makes" for *order* as well as "for righteousness," and which he fitly terms supreme creative will; and, resting in this, endure with more complacency and faith the inevitable prevalence of evolutionary views which he is powerless to hinder. Although he cannot arrest the stream, he might do something towards keeping it in safe channels.

We wished to say something about the way in which scientific men, worthy of the name, hold hypotheses and theories, using them for the purpose of investigation and the collocation of facts, yielding or withholding assent in degrees or provisionally, according to the amount of verification or likelihood, or holding it long in suspense; which is quite in contrast to that of amateurs and general speculators (not that we reckon Dr. Dawson in this class), whose assent or denial seldom waits, or endures qualification. With them it must on all occasions be yea or nay only, according to the letter of the Scriptural injunction, and whatsoever is *less* than this, or between the two, cometh of evil.

MR. BAGEHOT'S DESCRIPTION OF THE MONEY MARKET.*

PROBABLY not one per cent. of the reading public know what is meant by the "money market" of which they hear so much, or understand the process by which every few years disturbances in it endanger their fortunes or curtail their comforts. What it is, and in what manner its operations affect the community at large, Mr. Bagehot undertakes to explain in the volume before us, and he selects the London money market as his illustration, because it is by far the largest and most active in the world. Now, what constitutes the money market? Simply the collection together in one place of all the capital of the country which is not actually engaged in industrial enterprises, and is therefore available for loans; and in no place is the amount of this capital so large as in London. By far the greater portion of the spare money—that is, the money which people are not using—finds its way to London in small streams, and is there lent by the great money dealers. Individuals deposit it in the country banks, and the country banks send up whatever they are not using in their own business to the Bank of England, which thus becomes the great depository of the spare cash of the nation; and the Bank of England lends it out right and left, sometimes to those who actually use it in production, but also to those who themselves lend it again. The sum available for lending in this way on deposit was,

In London, in December, 1872	$600,000,000
In Paris, February, 1873	63,000 000
In New York, " "	200,000,000
In the German Empire	40,000,000

It will thus be seen how enormously the "loan fund" of England, as Mr. Bagehot calls it, exceeds the loan fund of any other country. In fact, the promoters of great enterprises in nearly all countries go to England to borrow the money, and if the enterprise give even a tolerable prospect of success, they never fail to get it. It is the way in which this loan fund is accumulated and managed that Mr. Bagehot seeks to make plain to us.

It is managed by all the banks and the bill-brokers, but especially by the Bank of England. The private and joint-stock banks receive deposits, and make loans; the Bank of England receives deposits, makes loans, and issues paper money; and the bill-brokers borrow money from the banks at one rate of interest, and lend it on mercantile paper at another. Not only all of the London banks and bill-brokers, but the country banks all over England and Ireland, keep their "reserves," or the money of which they have no immediate need, on call at the Bank of England, and the Bank of England lends out about three-fifths of it. In other words, the reserves of the whole country eventually find their way into the Bank of England, and are used in large part by the Board of Directors of that institution in their daily business, so that the responsibility devolving on the Bank is in Mr. Bagehot's opinion almost frightful. The superstructure of credit created on this London loan fund is enormous, and when a panic comes, as it does in every ten years, the Bank of England has to bear the brunt of it. The private banks and the joint-stock banks run to it to draw out their reserves; the bill brokers run to it to borrow, and so do the merchants, so that the amount of "accommodation" it has to supply, besides the drain on its deposits, is very great.

Taking the pound roughly at five dollars, the loans on "private securities" increased,

In 1847, from	$90,815,000 to $102 045,000
In 1857, from	102,020,000 " 156,750,000
In 1866, from	92,535,000 " 167,235,000

Now, the Bank of England has, ever since 1844, been restricted by law from issuing more than $70,000,000 in notes, except on the security of an equal amount of bullion. On each of these three occasions, however, the panic would have "broken" the Bank if the Government had not suspended the law and permitted the issue of as much paper as might be necessary to allay the prevailing terror.

This state of things fills Mr. Bagehot with alarm. He thinks that since the Bank of England is allowed to hold the ultimate reserves on which all the other banks have, in times of trouble, to fall back, there should be a clear understanding, which at present there is not, "that the Bank will replenish this reserve in times of foreign demand as fully, and lend it in times of internal panic as freely and readily, as plain principles of banking require," and he is a firm supporter of the rule that the bank should look carefully after this reserve, and should early, at the smallest sign of a drain on its bullion, stop the outflow, and draw in a fresh supply from other countries by raising its rate of interest. This caution is rendered all the more necessary by the fact that London is now more than ever the great monetary centre of Europe. Paris used to divide the honor and responsibility, but the late war has shaken confidence in the Bank of France, and now all the great sums for which individuals or governments on the Continent have no immediate use are sent to the Bank of England to be deposited on call. The German Government left a large portion of the French indemnity there in this way, and the French sent it there by paying in bills on London. In fact, there now flows from all corners of the Old World a steady stream of spare wealth to the London loan fund, to be drawn on as it is needed by bills of exchange.

The Government interferes with the money market in England by having made the Bank of England its financial agent for nearly two centuries. It keeps its money there on deposit, and in return the Bank is expected to make it loans when it wants them. The result is that it is identified with the Bank in the eyes of the world, becomes responsible for it in great commercial crises, and seems to share its credit or discredit. The system is, Mr. Bagehot thinks, a bad one; but it is now too late to abandon it and attempt anything else. It has become rooted in English political habits and traditions, and this constitutes in England a consideration of the highest order of expediency. The importance attached by the commercial world to the rate of interest charged by the Bank of England, and which causes it to be telegraphed everywhere, leads many people to suppose that the Bank has some peculiar power or authority to regulate the value of money in the London market. But the fact is that the power of the Bank over the rate is simply that of the largest dealer. When the Bank lowers its rate, the smaller lenders are forced to lower theirs. When the Bank raises its rate, the others do not always follow its example immediately, but they are pretty sure to do so soon, because their own supply is rapidly exhausted, and they are themselves compelled to resort to the Bank for more. But the Bank is prevented from making the rate too high, and keeping it up too long, by simple consideration of the effect on its business, because, like other banks, it seeks to make money by lending money. In fixing the rate, it is usually guided by the amount of bullion in its vaults.

Mr. Bagehot's chapter explaining "why Lombard Street is sometimes dull and sometimes excited," contains the rationale of commercial panics. After a commercial crisis there is a period of considerable depression, during which money in great quantities lies idle in the banks, and is offered at low rates of interest, and nothing new is undertaken in trade and industry, and people in general restrict their expenditure. After a time confidence begins to revive, and if along with its revival comes a good harvest, the revival rises into buoyancy of spirits; the money is all drawn out of the banks, and once more set to work. Prices begin to rise; the demand for commodities increases, and everybody gets into the highest spirits, and even the most cautious extend their operations, and everybody, in the general increase of confidence, is ready to trust everybody else. At last, it is found that the more hopeful and buoyant, who have been producing most actively, and trusting most largely, either begin to find difficulty in getting purchasers for their wares, or find that the persons to whom they trusted in the belief that they would produce, have not produced, and are unable to repay, and a general panic ensues. During the period of the pressure, there is a glut of money in Lombard Street, and low rates of interest. During the buoyant period, there is great activity and high rates of interest. In other words, the money market is moved by almost regularly recurring psychological cycles. Mr. Bagehot is a firm believer in the theory that panics are largely, not wholly, mental phenomena, and that they can be allayed by remedies addressed to the imagination, that is to say, by a plentiful supply of money to frightened people by the banks at the first outbreak.

* 'Lombard Street. A Description of the Money Market. By Walter Bagehot.' New York: Scribner, Armstrong & Co. 1873.

The book is in the main descriptive. Mr. Bagehot does not discuss theories of banking or currency. He simply describes and explains phenomena which everybody has every day before his eyes, and which in our day everybody ought to understand, and he explains them with wonderful lucidity. Considering the ruin which is wrought and the unhappiness which is caused in the complex commercial societies of our day by great financial errors and misfortunes, it is safe to say that there is hardly any agency just now more likely to contribute to the general well-being, than a widely diffused knowledge of the causes and marks of financial folly and unsoundness. The ignorance of the general public on all these matters is now most deplorable and most dangerous. We do not refer to the nonsense which has been poured forth by newspapers and stump-orators during the last few years about the currency and the national debt, but to the blind and barbarous terror into which loss of confidence plunges the community. The run on the banks, which attends the outbreak of every panic, by depositors who well know that no bank keeps its deposits always on hand, is one of the disgraces of our civilization. A century or two hence it will be looked back upon as one now looks back on witch-burning. To make such displays of unreasoning selfishness impossible ought to be the earnest desire now of every lover of his kind, and nothing can do this but knowledge of the nature of the great machinery of exchange and credit, and, though Mr. Bagehot's book is confined mainly to the exposition of the conditions of the English market, no one who wants to familiarize himself with the elements of financial science can do better than read it.

A New Biographical Dictionary. By Thompson Cooper, F.S.A. (New York: Macmillan & Co.)—The preface to this compact little volume (of 1,211 pages) states that the object of the work is "to present in a compendious form biographical memoirs of distinguished personages of all ages and countries, and more particularly of eminent natives of Great Britain and Ireland." And further: "Without making any invidious comparisons, it may be confidently asserted that this dictionary is the most comprehensive work of its kind in the English language, and that it comprises memoirs of hundreds of persons whose names are not to be found in any other general or special collection of biography." Mr. Cooper's language is much too unqualified. So far is he from embracing in his scheme the famous men "of all ages and countries" (excluding the living), that all the proper names of Scripture are omitted; and as for fulness, we have compared his list, from *A* to *Abruzzo*, with Dr. Thomas's 'Biographical Dictionary,' and find that the latter gives 271 titles to his 111—a superiority of at least two to one, even if we leave out of count the Scriptural and living names. Moreover, it is perfectly clear that "the hundreds of persons whose names" occur in Mr. Cooper's collection only, are not fairly to be called "distinguished personages"; and, as they constitute the sole and peculiar merit of the dictionary, the author might have been content to say of it, as we now say, that it will be found more than commonly full in British biographies, including many not heretofore thought entitled to a place in similar works of reference, but desirable to have on that very account. More than this we cannot say, and, while conceding the dictionary a place in almost any library, we must point out the defects which prevent our recommending the use of it unless controlled and supplemented by some other authority.

Our examples will mainly connect themselves with this country, but they will at the same time afford a test of the feature in which this dictionary chiefly differs from others. To begin with, there is no mention, under Henry Hudson, of his discovery of the river which bears his name, and the consequent founding of the metropolis of the Western world. Another enterprising Englishman, his contemporary, Captain John Smith, cut a sufficient figure in exploring and settling America to deserve, one would say, a larger space or greater consideration in these biographies. However, he fares better than Governor John Winthrop of Massachusetts, who is not named at all; neither is his son John, although he, too, was a New England Governor, and, what is more, a founder of the Royal Society of London. John Harvard we meet with, dying at Charles*ton* (instead of Charles*town*), Mass., and in 1688 instead of 1638. Sir George Downing, a native of London, but a graduate of Harvard College (1642), is wrongly stated to have been the son of Calybute Downing, in place of Emanuel, of Salem, Mass. Mr. Cooper's treatment of him will be thought very inadequate by those who regard him as one of the foremost of English statesmen, who, as a confidential member of Cromwell's staff, as his minister to Holland, as prompter if not author of the Navigation Act, and instigator of the capture of New Netherlands, as Secretary of the Treasury (giving his name to Downing Street), and as the originator under Charles II. of the practice of confining appropriations to the objects for which they were asked, and compelling estimates to be furnished in advance, indissolubly connected his name with some of the greatest events in the history of the Anglo-Saxon race and of modern civilization. (Even Thomas, we observe, omits this notable if not very admirable character.) William Goffe, the regicide, who lay concealed many years in Connecticut and Massachusetts, we confidently expected to find in Cooper among the "hundreds of persons," etc.; but he does not appear, nor does his companion and father-in-law Whalley. The two Anglo-Americans, Lindley Murray and Copley, are not overlooked; neither is Count Rumford, whose family name, however—Benjamin Thompson—is not given, and no allusion is made to his having planned and founded the Royal Institution. Of John Paul Jones it is not remarked that his real name was John Paul.

Neglect of the Englishmen who won for the crown and for the dominant race and language of the world this vast continent, prepares us for the neglect of their predecessors, the French and Spanish explorers: not a word of De Soto, for instance, nor of La Salle, Joliet, Marquette, or Frontenac. Champlain, it is true, is remembered, but the Lake named for him is said to be in Canada; and whereas his first voyage to Canada was undertaken in 1603, he is said to have been born in 1600! The true date, according to Parkman, is 1567. We can but think that if the independence of the United States may excuse the omissions we first pointed out, the relations of Canada to the mother country are still such as to make it only proper for Mr. Cooper to have paid more attention to the early history of this province.

Ueber das Wesen und die Geschichte der Sprache. Von Prof. W. Rösch. (Berlin: Carl Habel; New York: L. W. Schmidt. 1873.)—Number 172 of the collection of popular scientific expositions edited by Virchow and Holtzendorff, Berlin, is an essay by Prof. W. Rösch, sketching in a lively way the current views of the origin of language and the nature of its growth. A German who has any vein of rational psychology in him—and what German has not who writes about the origin of language?—is confronted at the start by a difficulty almost unknown to Anglo-Saxons. We are used to thinking that we are conscious of all our mental states, and that all men pay more or less reflective attention to themselves; but it seems to be a fixed fact of German scientific common sense that mankind were at first without reflective consciousness, and that infants are so now, and that it is a primary problem for psychology to find the way out of this original, unthinking, sensitive condition into the region of apperceptions. The number and ingenuity of the German solutions of this problem are something surprising. That language somehow does the business they are pretty well agreed, but exactly how they cannot agree. Prof. Rösch, after pecking about a little, chips the shell with a figure. As a sleeper who cries out in his dreams, and wakes himself by the noise of his cry, so, he puts it, the speechless man, as yet without reflection or knowledge of self, is moved by impressions about him to utterance, and wakes himself by his cry to reflective consciousness. Speech seems to presuppose reason, reason seems to presuppose speech; there must have been an incipient stage from which both developed with equal steps and mutual dependence.

Of what nature are the first words? Imitations of the noises made by external objects, says the bow-wow theory. Natural cries, says the pooh-pooh theory. And there is truth in both. The incipient speech is to be classed, not with mere involuntary cries, but with the partly voluntary expressive movements, like laughter, weeping, and the like. For a proper word implies something more than feeling. Words are thought; and since thought ranges so far away from sound, how can sound express it? By using analogies and resemblances, it is commonly said, between sounds, sights, tastes, and other qualities of matter and mind. But one of the latest German scholars, the too-early-lost Geiger, to whom Prof. Rösch pays a kindly and graceful passing tribute, has another theory, not yet become commonplace. He emphasizes the fact that sight plays the largest part in the development and direction of thought, and he seeks for a point where sight and hearing combine. This he finds in the movements of the human face. Language is a growth in society, and begins in an imitation, by one person, of the expression and movements of the face of another, including the vocal organs. This imitation gives vocal sound, at once reflective, voluntary, and significant, and that is speech. These sounds are simple and vague in meaning, and are made more definite by variation of tone and by gestures, till monosyllabic roots are established.

Our essayist goes on to describe the growth of language in the monosyllabic Chinese, the agglutinating and the inflecting speeches, all in the orthodox fashion. Whether all spring from a single parent speech he knows not. He magnifies the exploit of discovering the parent speech of the Indo-European family; and closes by describing the parent tribe of the Indo-Europeans as constructed by modern science. All this, and plenty more, is in thirty pages, to be had for five groschen, and makes an acceptable number of this valuable series.

RECENT PUBLICATIONS

OF

HENRY HOLT & CO. (late Holt & Williams),

25 Bond Street, New York.

INGRABAN. The second novel of a series entitled "Our Forefathers." By Gustave Freytag, author of 'Debit and Credit.' 16mo (Leisure Hour Series), $1 25.

"The narrative gives a romantic freshness to the incidents of the past, and clothes in a garb of living reality the workings of the human heart, which are the same in every age."—*N. Y. Tribune.*

HADLEY'S ESSAYS. Philological and Critical, 8vo, cloth, $4.

HARDY'S A PAIR OF BLUE EYES. 16mo (Leisure Hour Series), $1 25.

HEINE'S SCINTILLATIONS. I. Florentine Nights. II. Excerpts. With a Biographical and Critical Sketch, 16mo (Leisure Hour Series), $1 25.

*LORD HOUGHTON'S MONO-*graphs, Personal and Social. With Portraits of Walter Savage Landor, Charles Buller, Harriet Lady Ashburton and Suleiman Pasha. 12mo, $2.

LOUISA PARR'S HERO CARTHEW. By the author of 'Dorothy Fox.' 16mo (Leisure Hour Series), $1 25.

SPIELHAGEN'S WHAT THE SWALLOW Sang. 16mo (Leisure Hour Series), $1 25.

STEPHEN'S LIBERTY, EQUALITY, Fraternity. Large 12mo, $1 25.

THE WOOING O'T. A Novel. By Mrs. Alexander. 16mo (Leisure Hour Series), $1 25.

JUST OUT.

THREE GOOD NOVELS.

THE NEW AMERICAN TALE

BY

ROBERTSON GRAY.

BRAVE HEARTS. 12mo, extra cloth, stamped cover, $1 75. Illustrated by Darley, Stephens, Beard, and Kendrick.

This is a characteristic American Novel, under the *nom de plume* of a favorite story-writer, heretofore known by the brilliancy, wit, pathos, humor, and *readableness* of the shorter tales published under his own name. 'Brave Hearts' is a daring plunge into a new field, combining the culture and civilization of New England and New York with the bold, pithy dialect of the Pacific slope and the wild adventure of life among the miners. It is full of stirring *action* from beginning to end.

The apt and spirited illustrations lend an additional charm to the story, which is a capital piece of character-drawing.

A Clever and Amusing Novel.

A GOOD MATCH. By Amelia Perrier, author of 'Mea Culpa.' 1 vol. 12mo, extra cloth, fancy stamped cover, $1 50.

"Racy and lively."—*Athenæum.* "Agreeably written."—*Public Opinion.* "As pleasant and readable a novel as we have seen this season."—*Examiner.*

Also a new edition (41st thousand) of Mrs. H. B. Stowe's famous story,

MY WIFE AND I; or, Harry Henderson's History. 12mo, extra cloth, stamped cover, $1 75. Illustrated by H. L. Stephens.

This delightful novel is still selling rapidly. Everybody reads it. It is eminently a book for the times, giving the author's individual ideas about the much-vexed Woman Question.

"Always bright, piquant, and entertaining, with an occasional touch of tenderness, strong because subtle, keen in sarcasm, full of womanly logic directed against unwomanly tendencies, Mrs. Stowe has achieved an unbounded success in this her latest effort."—*Boston Journal.*

HARPER'S CATALOGUE.

The attention of those designing to form libraries, or increase their Literary Collections, is respectfully invited to Harper's Catalogue, which comprises a large proportion of the standard and most esteemed works in English Literature—*comprehending over three thousand volumes.*

Librarians, who may not have access to a trustworthy guide in forming the true estimate of literary productions, will find this Catalogue especially valuable for reference.

The Catalogue is arranged alphabetically by the authors' names, anonymous works by their titles. The index is arranged by the titles of the books, besides having numerous appropriate heads, each general head being followed by the titles of all works on that subject.

Harper's Catalogue sent by mail on receipt of six cents.

Address HARPER & BROTHERS,

Franklin Square, New York.

MACMILLAN & CO.'S LIST.

NOW READY,

New Work by the author of 'The Heir of Redclyffe,' etc., etc.

THE PILLARS OF THE HOUSE; or, Under Wode, Under Rode. By Charlotte M. Yonge. 2 vols. crown 8vo, cloth, $3 50.

PROSE IDYLS, New and Old. By Rev. Charles Kingsley, Canon of Westminster. 12mo, cloth, $1 75.

FIRST PRINCIPLES OF MORAL Science. A Course of Lectures delivered in the University of Cambridge. By Thomas Rawson Birks, Professor of Moral Philosophy. 12mo, cloth, $3.

ON SOME INFLUENCES OF Christianity upon National Character. Three Lectures delivered in St. Paul's Cathedral. By R. W. Church, M.A., Dean of St. Paul's. 12mo, cloth, $1 50.

HOLIDAYS ON HIGH LANDS; or, Rambles and Incidents in Search of Alpine Plants. By Rev. Hugh Macmillan, LL.D. 2d edition, revised and enlarged. 12mo, cloth, $2.

New Biographical Dictionary, by the Editor of 'Men of the Time,' etc., etc.

*A NEW BIOGRAPHICAL DIC-*tionary, containing Concise Notices of Eminent Persons of all Ages and Countries, and more particularly of Distinguished Natives of Great Britain and Ireland. By Thompson Cooper, F.S.A. Crown 8vo, cloth, $5.

"To all who know the value of such literary apparatus we mention with special commendation 'A New Biographical Dictionary.'—*Christian Union.*

LIFE OF SIR HENRY LAWRENCE. By the late Major-Gen. Sir Herbert B. Edwardes, K.C.B., K.C.S.I., and Herman Merivale, C.B. Third edition, with two Portraits. 8vo, cloth, $5.

MACMILLAN & CO.,

38 Bleecker Street, New York.

JUST PUBLISHED,

KINDERGARTEN CULTURE IN the Family and Kindergarten. By W. N. Hailman, A.M. A complete sketch of Froebel's system of Early Education, adapted to American Institutions. Illustrated. Price 75 cents.

*RAY'S SURVEYING AND NAVIGA-*tion, with a Preliminary Treatise on Trigonometry and Mensuration. By A. Schuyler, A.M. Price $2 25.

THE SCHOOL STAGE. By W. H. Venable. 27 New Juvenile Acting Plays Plain and full directions. Illustrations by Farny. Price $1 25.

ECLECTIC CLASSICAL SERIES. By G. K. Bartholomew:

I. LATIN GRAMMAR.—A concise and systematic arrangement of the laws of the Latin tongue. Price $1 50.

THE WEEK IN TRADE AND FINANCE.

OCTOBER 13, 1873.

THE situation in financial affairs continues to improve slowly but surely; greenbacks are gradually returning to the proper channels of trade, and it is understood that the banks are receiving considerable amounts, although it cannot, of course, be ascertained to what extent, owing to the non-publication of the regular weekly bank statement by the Clearing-House.

The savings-banks still hold on to the currency received from the Treasury in payment for the 5-20's sold by them, and this is the principal drawback to the banks' again undertaking to pay legal tenders and National bank-notes on checks. It is urged that the savings-banks should go into the market and repurchase their 5-20's, and thus put afloat the currency which they have locked up; but the advice does not seem likely to be followed.

The National Trust Company resumes business to-day, and the Trustees of the Union Trust Company are considering the subject of resumption, which rumor says will be brought about soon.

The money market has been comparatively easy, considering its condition for the past month; rates during the week have ruled from 7 per cent. per annum to ⅛ per diem. Towards the close of the week the tendency of rates was downward, and on Saturday loans were made quite freely at 7 per cent., and ½ commission added. The improved condition of affairs is marked by the decline in the premium on legal tenders, which, at the beginning of the week, were in active demand at 1 to 1¼ per cent. premium against certified checks, while at the close they were quoted at ¼ to ½ per cent.

Two failures are reported since our last: Messrs. Wylie & Knevals, sugar brokers, and Messrs. Gibson, Casanova & Co., bankers. The latter firm came to grief through advances made to a new railroad; their business was principally with Cuba, where the firm was well known and highly respected.

Commercial paper moves rather more freely, with rates quoted at 15 to 24 per cent. per annum. We hear of sales of good names at 18 per cent.

No change was made in the Bank of England rate of discount on Thursday, which remains at 5 per cent. The Bank lost £617,000 in bullion during the week.

The committee appointed by the Stock Exchange to investigate the transactions of John Bonner with the Bank of North America has made its report, which we publish, as it may prove interesting in showing the manner in which the banks have been in the habit of over-certifying brokers' checks, and the danger of so doing. The following is the report:

"By the evidence submitted to your Committee in the matter, the following summary of facts appears to be established:

"About 12:30 o'clock on Saturday, the 20th of September, John Bonner was sent for by a banking-house, to whom he had paid a check certified by the Bank of North America for a loan, and told that there were rumors in circulation unfavorable to the bank, and they desired him to take back the check and return the securities. This he was unable to do, and they notified him that they would hold him responsible for the check if it was not paid by the Bank of North America, through the Clearing-House, on Monday. On his return to his office, he found other parties waiting, demanding the return of their property, and insisting on his taking back the certified checks which he had given. Mr. Bonner proceeded to the Clearing-House, and was informed that the Bank of North America had not effected its clearances of the day before, and that the Vice-President was endeavoring to borrow $200,000. He determined not to pay out any more checks of this bank, more of which he held certified, but returned them at once to the teller, and refused to receive any more stocks from other parties. Mr. Bonner had checks certified by the bank that morning for about $356,000; he had deposited early about $124,000, which, with a balance of $60,000 to his credit, made his overdraft about $172,000. He took legal advice, and found that he would be held responsible for all the checks he had drawn that day if the Bank of North America should be unable to make good its clearances on Monday morning. He then determined to raise the money for the overdraft and deposit it with Mr. Leverich, of the Clearing-House Committee, in trust, to be paid to the Bank of North America, at the Clearing-House, on Monday, in the event of their paying the checks they had certified for his account. Had the Bank of North America been unable to protect their certified checks, the money in the hands of Mr. Leverich was to be applied towards payment of Mr. Bonner's checks, so far as it would go. After making this arrangement, he called on Mr. Donaldson, and notified him of the step he had taken. Under no circumstances could the Bank of North America lose money by Mr. Bonner's transaction. On the ensuing Monday, when the clearances were made, the Bank of North America charged the Bank of New York, on its clearing ticket, with $172,000, which was duly paid over, and the transaction closed. On a careful consideration of all the circumstances, the Committee have come to the conclusion that Mr. Bonner should be exonerated from any dishonorable act or intent."

The trouble experienced by the Bank of North America, together with the great dissatisfaction expressed by merchants at the custom of Wall Street banks in allowing brokers to overdraw their bank accounts, will undoubtedly lead to a discontinuance of the practice and the establishment of a stock clearing-house organized somewhat upon the plan suggested by Mr. Groesbeck, mentioned in these columns some weeks ago.

The stock market has been quite active during the week, and, at times the fluctuations were wide, indicating an unsettled feeling and the belief that the rapid advance of the previous week in the prices of nearly everything on the list would not hold. This turned out to be true as the week advanced. Prices gave way, and towards the close the market had fallen heavily below the prices current on Monday. The result of the bankruptcy proceedings in the case of George Bird Grinnell & Co., before Judge Blatchford, was eagerly looked for by Wall Street, as upon this decision important business transactions depend, and it is not unlikely that a new interpretation will be given to the bankrupt law, seriously affecting the interests of parties who have made loans upon collaterals to the firm in question, and which threatens to leave them in no better condition than those who have unsecured claims. Judge Blatchford, after hearing the arguments of the lawyers representing both sides, reserved his decision till next Saturday, when the case comes up again, though he has modified his injunction so far as to permit the sale of certain securities held as collateral. The final disposition of the matter, however, is still anxiously awaited by the "Street."

The following shows the highest and lowest sales of the leading stocks at the Stock Exchange for the week ending October 11:

Government bonds show a considerable falling off in prices, as compared with quotations early in the week, which is attributable to the decline in gold. Besides this, many holders have been selling and investing the proceeds in good railroad bonds and stocks, as the latter have declined very much more than Governments, and the exchange offers a very good margin for profit.

Gold has steadily declined during the week, and the lowest price since the war has been reached. The market opened at 110 on Monday, and on Tuesday the highest price was reached—110⅜. The price commenced to decline from this point, until on Saturday the indicator marked 108⅛. The arrival of between $3,000,000 and $4,000,000 in specie from Europe, with the prospect of considerable further receipts, has been the main cause of the decline in the premium. There was no "bull party" to support the market; and unless the demand for foreign exchange increases, there is at present no real cause for any important deviation from current quotations.

BOOKS BY MAIL.

Orders for books will be filled by the *Nation* subject to the following conditions, which must be strictly observed:

1. That the money be forwarded in advance whenever the price is known.

2. That enquiries as to price or other particulars be accompanied by a *stamped* and addressed envelope for the reply. (These enquiries should be as *specific* as the knowledge of the writer will permit. It is presumed that in most cases the name of the work, of the author, or of the publisher can be given.)

3. That both money and books shall pass through the mails at the risk of the purchaser.

The Nation.

NEW YORK, THURSDAY, OCTOBER 23, 1873.

The Week.

THERE has been a rumor during the week—since denied, however—that Jay Gould was about to retire from Wall Street, owing to impaired health and other causes. If it were true, it would cause the press considerable embarrassment. Jay Gould has long served as the great newspaper devil, who puts rival editors up to all manner of wickedness, besides causing all the trouble in the financial world. Sometimes he makes stocks too high, at other times too low, besides "locking up gold and currency," and raising the rate of interest in wicked defiance of the usury laws, and inspiring our youth with the spirit of gambling. In fact, if we are to believe half what we hear, his day is passed somewhat as follows: Rising early, he creeps out and waters the milk of his neighbors, and steals the morning papers from their front door; and, as he goes down-town, passes off counterfeit money in small amounts in the more crowded stores. On reaching his office, he makes his combinations for running up whatever stocks rise during the day, and depressing those that fall, and for making corners in gold and greenbacks. He then goes out and tries to induce cashiers to speculate with the bank funds, and confidential clerks to forge checks and run off with the proceeds, and, returning to his desk, writes elaborate directions to the editors of the *Times*, *Tribune*, and *World* for their financial and stock articles on the following day, with criticisms on the mode in which they have carried out his directions of the previous day, enclosing, when he is well satisfied, a small douceur. Towards night, he spreads reports that the Pennsylvania Central, the United States Trust Co., and perhaps the Bank of England, are going to fail, and goes calmly up-town to Delmonico's, picking pockets all the way, and, after a gluttonous and solitary repast, reaches his home, and retires to bed cursing and blaspheming.

Henry Ward Beecher delivered a lecture on Monday evening which ought to do good, if the preaching of common sense in exciting times ever does any. He maintained, contrary to the cant which always begins to fill the air after a financial panic, that it is a good thing to get rich, if one can do so honestly; that, when one is rich, it is right and proper to surround one's self with beauty and comfort. In fact, the history of civilization in its best sense, as everybody ought to remember, even when Rock Island is selling at 90, is the history of the efforts of great numbers of men to make money. The great triumphs of art and literature and science have all been achieved in communities successfully striving after wealth, and not among people who lived on black broth and carried iron coins. He also made some useful remarks on the old doctrine that it is only among farmers that honest men are found, and that there is a necessary and constant connection between green fields and virtue. He said, and said truly, that of all the members of our legislatures farmers are the easiest to buy and the readiest to be seduced. Their denunciations of the railroad men as thieves and swindlers when they want them to carry their grain for a trifle are, therefore, at least immodest. There is probably more temptation withstood successfully in Wall Street in a single day than "the bone and sinew of the country" resists in ten years. There is no time when it is more necessary for us to clear our heads of cant—which is at all times one of man's first duties—than when stocks are very low and money tight. The cheap, sick-bed morality of a panic is anything but strengthening. We ought not to have to look at the money article of our morning paper in order to decide whether we shall be good through the day.

The *Economist* thinks that it is hardly possible to overestimate the good effect, in calming the panic, of telegraphic communication with Europe. It is only fair to admit, of course, that there is a drawback at times in the "echoing power" of the Cable—each money market being troubled by bad news of the other, and the bad news tending to accumulate; but the telegraph works against panics in two important ways. It has, in the first place, materially shortened the time within which assistance can be rendered; the failure of Jay Cooke & Co. was almost immediately followed by the shipment of gold from England. But, in the second place, the shipment of gold has an effect before it arrives, because the telegraph announces it, and the mere knowledge that gold is on its way is likely to allay panic and revive credit. In 1857, the crisis broke out about the end of September, but the news did not reach England till the middle of October, and this country had a whole month to live without receiving help, or knowing of its probable arrival.

Some time since, the firm of F. R. Sherwin & Co., 78 Broadway, issued confidential circulars announcing that they had opened the business of forming "syndicates" of $5,000 each, on the same principle as those which had become so popular on the different bourses of Europe, enabling persons of small means, and those who desired only to risk a certain specific amount, to take their chances on the stock market, and at the same time to limit their losses to the amount of their shares. Each syndicate was to be composed of 100 shares at $50 a share, and when all the shares were taken operations were to commence immediately, and to continue for a period of three months, when the syndicate would be closed, a statement made to the shareholders, and the amounts due them held on deposit and subject to their order. At or before this time, one Charles H. Phelps was engaged in the "railroad, telegraph, and express business" in the South and Southwest. In 1871, he came to New York, went into the "commission business" under the name of "Charles H. Phelps & Co.," opened two stores, at 238 Front Street and at No. 33 Peck Slip. The only thing known about the character of his business, which lasted two months, consists of an extract from reports of certain commercial agencies to merchants, "Use great caution; on all goods sold them, or sent for sale, cash down should be had before delivery"; and the following "record," also from commercial agency books: "August, 1871, store and offices well filled up, but no stock. October, swindling concern, and closed." Mr. Phelps next reappeared as cashier in the State Treasury at Albany, and, availing himself of the "banking facilities" afforded by F. R. Sherwin & Co., has robbed the State of some $150,000, by the simple process of stealing drafts and depositing them to his own account, for which offence he is now on trial.

In politics, Phelps had once been a weigher in the Custom-house, in which position he was honorably acquitted of the charge of selling offices, was removed from office by Thomas Murphy for political reasons, and was for a few months "in the Chief Clerk's office at Police headquarters." He was appointed cashier by Raines, the State Treasurer, on the usual recommendation from a "large number of prominent citizens" of his own county. The manner in which the public business at Albany is conducted may be inferred from the affidavit of Deputy-Treasurer Paul, who swears that he signed the endorsements of two drafts prepared for him by Phelps, without looking to see to whom they were made payable. The endorsements were to one Hudson, cashier of Sherwin & Co., and Mr. Paul says he "supposed" that they were to one of the State depositaries. To make such a mistake as this without "criminal negligence" appears to us to be a physical impossibility.

The railroad question in Minnesota has been solved by an opinion of the Supreme Court of that State deciding that the legislature has the full right to fix the rates of tolls, and that it may make them reasonable or unreasonable as it pleases. What the legislature grants to a railroad is a right to take "some toll"; but if this means, as is commonly supposed, "reasonable tolls," then, the Court asks, what becomes of the right to regulate transportation, which every one admits is vested in the legislature? "The State has conferred upon the defendant (the Winona and St. Peter Railroad Company) the right to make some charge—*i. e.*, to take some toll—not any specified rate of tolls, nor to take tolls within any designated limits, nor to take reasonable tolls. The right conferred is simply to take tolls." This is a wholesome decision, but it does not seem to us to go far enough. The country will never have any real repose until we have a double-track, steel-rail freight-road laid down from every man's door to deep water, a constitutional amendment limiting the rates on a bushel of corn from Chicago to New York to 14 cents, and all holders of "watered stock" condemned to hard labor for life.

We were wrong, it seems, in saying last week that the Senate Transportation Committee had disbanded. The Committee is still holding meetings, and its latest enquiries have been into the "terminal facilities" of New York. For the purpose of getting to the bottom of the subject, the Committee has examined the Hell Gate excavations, and explored the submarine chambers which General Newton has been making in that part of the East River. The bed of the river has been at this point almost completely undermined, and, when the work is finished, the supporting rock is to be blown away, the bed to fall, and the channel to be thus deepened. According to the newspaper reports of their visit, each member of the Committee was furnished with a torch, and, with Senator Windom at their head, they went through the chambers, and were much struck with what they saw in them. On their return to the sunlight, the reports all agree that "the talk reverted easily and naturally to terminal facilities and cheap transportation." We notice a disposition on the part of some of our contemporaries to ridicule the proceedings of this Committee, because it seems to have no definite object in view; but what of that? Its members are earnest, thoughtful, and enquiring men, and they probably understand one important branch of the cheap transportation question—that of getting themselves cheaply transported—as well as any men in the country.

The trouble which has for a long time been hanging over the farmers' movement has at last broken out in the shape of a quarrel with the Boston Grange. It was noticed at the time of the formation of this Grange that there were suspicious circumstances connected with it, and its managers are now accused of making use of its organization for political ends, an alliance with the "Loring wing" of the Republican party being suspected. This, however, is the inevitable end and catastrophe of all such movements. It has come very early in Massachusetts, because Massachusetts is not an agricultural State; but it must come in the Western States, as the farmers will discover when the legislatures meet, and the gentlemen who have been figuring during the summer as farmers' candidates take their seats at the various State capitals as full-blown politicians.

The Treasury has insisted upon it that the square flat-bottomed boats or scows carrying coal on the canal between the Pennsylvania mines and the port of Wilmington, are boats requiring to be furnished with enrolments and licenses, and the Custom-house officials have seized several boats belonging to poor men, and subjected them to heavy expenses. The matter has been carried into the Federal district courts, where the Government has been beaten in three several cases in three different courts; taken up to the circuit court on appeal, where the Government has been again beaten, with costs. Nevertheless, the following extraordinary order to the Custom-house has been issued from the Treasury: "The Department has been informed that the judges of the district courts of the United States for the eastern district of Pennsylvania and the district of Maryland have decided that canal-boats are not required by law to be provided with enrolments and licenses. This Department *does not acquiesce in their decisions*, but holds that such boats must be provided with the documents in question, or pay 'alien tonnage tax' of one dollar per ton, under Section 6, Act of February 18, 1792, upon coming out of a canal into the navigable waters of the United States." In other words, the Secretary of the Treasury formally announced his intention to disregard the decisions of the courts of law, and continue to levy a tax which they had pronounced illegal. The counsel for the boatmen, thereupon, prepared articles of impeachment against him, and reported him to the President, reminding the latter that he had felt called upon to overturn the State government of Louisiana by force of arms, through reverence for the orders of a drunken Federal judge in New Orleans—orders, too, which a majority of the Judiciary Committee of the Senate had pronounced unauthorized and void. This brought out Mr. Richardson with a disavowal of the letter, which he said was the work of a subordinate, and unauthorized by him. This, of course, ends the matter; but the public will hardly be satisfied with the excuse. That a Treasury subordinate should, in the absence of his chief, dare to declare that the Department did not "acquiesce" in the decisions of the United States courts, and order Custom-house officers to disregard it, seems most extraordinary; but, besides giving one a queer idea of Treasury discipline, it is another natural consequence of the glaring disregard of law of which both Mr. Richardson and Mr. Boutwell have from time to time been guilty in their administration of the national finances.

When the Samana Bay Company acquired its franchise in San Domingo from President Baez, last winter, we predicted (Jan. 23, 1873) that "the next thing would be to get the United States in some manner involved in the affair, so as to compel it to take possession of the Dominican Republic." We confess, however, that we had no idea that the "next thing" would occur so soon. It now appears that Baez, the patriot who was ready to sell his country to the United States two years ago, has not even the power to defend the Company to which he has granted such wonderful privileges. The barbarous population of the interior are now in arms against him, and threaten to descend on Samana Bay and "clean out" the intruders, as they regard them, to whom he has conveyed so much of Dominican soil. Nothing is more natural, and we were going to say more proper. Were we Dominicans, we should, during the fruit season, harass the Company incessantly. But the Company not unnaturally resists this interference, and Dr. Howe, and Mr. Fabens, and Mr. O'Sullivan have come to Washington to urge the Government to protect them. We trust there is no occasion to protest against the Government doing anything of the kind. We have neither men nor money to spare for any such enterprise. The Company well knew what its risks were when it took its charter. Moreover, it obtained among other concessions from the Baez Government the right to maintain an army and navy. It is fair to expect, therefore, that it will imitate its great prototype, the East India Company, and defend itself against the barbarians sword in hand. If it does, we shall all be proud of it. A very small force of enlisted men, under another Clive, would soon send the enemies of the Company flying through the palms and flowers, over the "ever-flowing brooks," and even drive them into the "ever-tepid crystal seas," which Dr. Howe described to us in his letter announcing the formation of the Company. Indeed, Clive would have been up in the mountains by this time after the enemy, in light marching order, full of yams and bananas and fight.

Apparently, the official count of the vote will be required to determine whether Mr. Allen or General Noyes is elected Governor of Ohio, but as we write, the probability seems to be that General Noyes is defeated by a handful of votes, running a little behind his ticket, the rest of which is now believed to be elected, while Mr. Allen runs a little ahead of the other Democratic candidates. This result has caused some surprise, and explanations are naturally numerous. The truth appears to be that a very large number of voters who usually act with the Republican party have been so much disgusted with the revelations of the past few months that they would not go to the polls. In the public conduct of the party magnates from President Grant and Mr. Jay Cooke down to Mr. Charles H. Phelps, there has been nothing to incite citizens to take trouble for the purpose of keeping the party in power. The voters therefore stay at home in large numbers, and in the districts where the Republican majorities have been heaviest the falling off is the plainest to be seen. As to how much of a Democratic revival this is to be called, there is a wide difference of opinion, our own, we are free to say, being that the question is one hardly worth discussing; but that there will be some abatement of Republican insolence it is quite safe to predict. A result of this contest which will not be regretted by many people outside of Ohio is that, the Democrats having got control of the Legislature, Mr. Thurman will be retained in his seat in the Senate, where, as is generally admitted, he does good service. The effect on our New York politics of General Noyes's defeat and the reduction of the Republican majority in Iowa and its total disappearance in Oregon, will probably be seriously damaging to the Republican candidates.

Stokes is being tried a third time for the murder of Fisk, and there seems a greater probability now of his escape than ever. The good effect of delay in a trial of this sort was well illustrated by the appearance on the stand of a new witness for the defence, one Patrick Logan, a Catholic policeman, who had been discharged from the police force in 1871 for refusal to do his duty during the Orange riots, and who was consequently nominated by his friends for the Assembly. He swears that some of the principal witnesses for the prosecution confessed to him that they were tampered with, and he tells his story in a straightforward way, but it does not seem really to amount to much, for it consists simply in the fact that the witnesses learnt their testimony by heart, which is not an uncommon thing for witnesses of a low order to do, and that they "expected" to get a great deal of money, though it does not appear that they were ever promised any. Still, the evidence makes a great deal of impression. If the trial lasts long enough, we may reach a point where it will be doubted whether Fisk ever was killed at all.

The Opposition in Canada have gained a great victory in the Pacific Railway scandal, and forced the Government to throw up the contract out of which the scandal grew. Considering the amount of money involved, and the magnitude of the political interests bound up with the Pacific Railway scheme, this victory deserves to be recorded in brass as a monument, even in these latter days, of the power of public opinion when founded on justice and truth. The Government appointed the court of investigation, subpœnaed the witnesses, and conducted the examination, strenuously denying the charges throughout. We observe that it is now said the abandonment of the contract was a foregone conclusion from the beginning, but there are always such foregone conclusions at the end of a battle. The English press has generally denounced the corruption practised by the Dominion Government, and the *Saturday Review* has again drawn upon itself, in consequence of its denunciation, the old reproach of being a "cynical Tory organ." As troubles never come single, Sir John Macdonald will be embarrassed at the next session by the presence, as a delegate from Manitoba, of M. Louis Riel, who some three years since was the head of a rebellion in that region, and as such put to death a British subject, and thus caused a price to be put upon his own head. He has since been nominally an outlaw, although the Opposition press have long affirmed that Sir John Macdonald was bound by a private agreement, made with the French party, to condone Riel's offence. This Sir John has denied, even appealing publicly to the Searcher of all hearts to bear him witness that he very much wished to catch the Provisional President, so-called, and bring him to trial for "foully murdering Thomas Scott after a mock trial." But it is now confessed that, at the time of making this appeal, Sir John, the late Sir George Cartier, and the Government generally, were under a pledge that Riel should not be harmed. Altogether, Canadian politics do not improve on inspection, however we look at them.

Castelar is doing all that he can do to restore order in Spain. He has not only "called out the reserves," which may mean something or nothing, but has fixed death or perpetual imprisonment as the punishment of mutiny, and he has restored all the artillery officers who resigned on account of the Hidalgo affair to their old rank in the service. His proposal to convert the public debt by substituting six per cents at forty for the present bonds, has been rejected by the Committee of Spanish bondholders in London, who ask for security. In the meantime, the insurgent fleet continues its antics along the coast. The Government squadron, under a new admiral, has retired before it, and at the date of the latest advices it was off the harbor of Valencia, threatening the town with bombardment, and troops were going from Madrid to assist in the defence. The foreign admirals, however, insist on ninety-six hours' notice to enable foreign residents to make their escape, and it is hardly probable that Contreras, the Intransigente leader, will either feel that he can wait so long, or that it would be safe to begin sooner. The last despatches make it likely that he will take his departure, if he can get supplies from the shore.

There is a variety of opinions about the chances of the Monarchy in the French Assembly. M. Léon Say, who is a knowing man, says the Republicans will have a majority, while M. John Lemoinne, who is also a knowing man, predicts the restoration as certain on the opening of the Assembly. M. Lemoinne's opinion, however, seems on the whole more likely to be correct. The Monarchists declare they are sure of their game, and they would hardly push forward their arrangements with so much boldness if they were not. There is also a variety of stories about these arrangements. One is, that the crown will be offered to the Comte de Chambord, who will accept it, and with it a constitution and the tricolor, and pending his arrival will appoint MacMahon Lieutenant-General with full powers. Another is, that if modern ideas are more than the Count can swallow, he will abdicate immediately after his arrival at Versailles, and the Comte de Paris take his place. In the meantime, the Duc d'Aumale, who is popularly, and probably correctly, supposed to be the guiding mind of the Orléans family, is, as our politicians say, "laying low"; and he is, in appearance at least, wholly absorbed in the Bazaine court-martial, of which he is president, and apparently takes no part or interest in the monarchical movements. In the meantime, he presses poor Bazaine hard in that cross-examination to which every French culprit is subjected, and probably is none the less zealous for the fact that he is probing Imperialism as well as convicting the Marshal. The latter stands the cross-examination badly, and in fact, if the telegraphic summary is to be believed, has already admitted that during the siege political considerations weighed a good deal with him in making his military plans, and in particular the consideration that the Government at Paris was what he called "an insurrectionary government." But there is the testimony of Marshal Lebœuf that his (Bazaine's) responsibility did not begin till August 12; that is, that up to that date the Emperor was in command.

THE APPROACHING ATTEMPT TO RID US OF AN ELECTIVE JUDICIARY.

THE people of the State of New York will be asked at the next election to say whether the experiment of an elective judiciary which they set the example of trying twenty-seven years ago has proved satisfactory, and whether they are now willing to go back to the old method of appointment. The question is perhaps as important a one as has ever been submitted to them, but it is a curious and instructive fact that neither of the political parties now in the field says one word about it in its platform. It is all the more curious and instructive because the doings of the Republican Convention were substantially regulated, and the platform drafted or approved, by Senator Conkling, who is talked of as a candidate for the Supreme Court of the United States, and whom his followers have of late been exhibiting to the public as a model politician. When the expediency of prolonging the terms of the judges was submitted to the people two years ago, the political managers in like manner abstained cautiously from lending it any countenance, and in this city absolutely failed to supply ballots for a vote on it, and would have defeated it in other parts of the State if they had not overestimated the popular indifference to it. There is nothing very surprising in this, when we remember that the election of judges for short terms has made an enormously valuable addition to the "spoils" which each party has to divide after the victory, and that the removal of the judges from the arena of party would considerably diminish the excitement and attraction of the politician's trade.

In the absence of all support from the regular party machinery, of course the zealous attention of the mass of good citizens who have no interest in spoils to the proposed amendments is all the more necessary for their success, and to this class Mr. Dorman B. Eaton appeals in a pamphlet on the history and results of the election of judges in this State, which ought to be in everybody's hand, and which we cordially commend to the perusal of every thinking man. The story Mr. Eaton tells is familiar enough to most inhabitants of this city at least, but there are some points in it which are both novel and suggestive. One is the manner in which the change in the mode of selecting judges was brought about in 1846. It was one of the greatest changes in the political history of the race, for it threw aside that ideal of the judicial position which had for four centuries been one of the most prominent objects in the great movement for limiting the authority of the crown, out of which nearly all of what are called constitutional principles have grown; and it even promised, as the commonest experience of human nature must have told everybody, to produce very startling modifications in the relations of the courts to the community at large. Nevertheless, the portion of the report devoted to it only occupied two pages, and the reporter, Mr. Ruggles, only said a few words about it. The most eminent members of the Convention opposed it, but the politicians did not even give themselves the trouble to debate it. It was carried on a pure theory evoked from a few Jeffersonian breasts, and so exactly adapted was it to the peculiar needs of managers and wire-pullers, that here in New York, where its evils have almost disgraced human nature, the Democratic managers now openly oppose any return to the older and better system, and the Republicans scarcely say a word in its favor. The *World* inveighs against any change. The *Tribune*, of the leading city papers, is left almost alone to advocate a recurrence to the mode of selecting judges which made the New York bench one of the glories of American law and letters—and this in just one year after the conviction of Barnard, the death of McCunn, and the flight of Cardozo. So lightly does our shame sit upon us, and so little impression has been made by one of the plainest experiments ever tried by a political community.

If everything that has been said in favor of an elective judiciary were true, there would still remain these two inherent evils in the system—first, that it inevitably tends to the selection of second-class instead of first-class lawyers for the bench; second, that it makes the same man a poorer judge than he would have been if he had not been dragged through the mire of a political convention and the dust and turmoil of a popular election. It is asserted, and it cannot be denied, that in some portions of the State the judicial nominations have been controlled by the bar, that no gross abuses have happened, and that generally very respectable gentlemen, of unquestionable legal ability, have been placed upon the bench. Hence it is an easy inference to the local reasoner that "the system seems to work well." Conceding that it does, we concede nothing more than that in those judicial districts where litigation is least in amount and least in importance—where, in short, the judiciary is the least tried—there the elective system does in a measure approximate to the old system, which died in 1846 with a reputation not only unblemished but exalted. The fact remains that the tendency of the present system—that is to say, the tendency of a political convention—is to select candidates for the bench from among the pretentious, the plausible, the obtrusive, the speech-making members of the bar, and to overlook those quiet, diligent, unobtrusive characters which are peculiarly the material out of which judges should be made. The additional fact also remains that the best members of an elected judiciary would be better judges—more independent, fearless, and impartial, so far as their individual character is involved—more respected and influential, so far as their official functions are concerned—if they had not been subjected to the officious zeal of personal friends, the condescension of political managers, and the calumny and detraction and criticism that make a part of every election. In every country, and in none more so than in our own, it is essential to the usefulness of the judiciary, to its moral power, and, in matters of right, to its controlling influence, that it be composed of good men, who, in addition to their subjective merits, shall be invested with the official attribute of being believed in. It is beyond the powers of human nature to allow its politicians of the baser sort, its Bohemians of the press, to pelt the candidate with mud during the campaign, and then believe that his new ermine will for ever remain unsullied because he had the most votes, and succeeded, notwithstanding the mud, in getting upon the bench.

The selfishness of human nature is probably nowhere more clearly illustrated than in the local selfishness of communities. It was this selfishness of locality which was the chief impediment in the framing of the Constitution, and which came so near defeating the consummation of the Union. It is the same selfishness which to-day is endeavoring to dishonor the State by keeping up a system which directly degrades her judiciary, and which has proved a grievous wrong to three-fourths of her people. There are men really thinking themselves upright and respectable, proud of being citizens of so great a State, yet who are ready to connive at maintaining a system which, more than all other things, has tended to make the name of New York infamous throughout the civilized world, and who have no other justification to offer than that the evil does not directly affect themselves. Of course such reasoning is fallacious, and demonstrates not only a moral turpitude but a logical obtuseness. No district can isolate itself and be long independent of a prevailing evil. The degradation of a part of a community cannot be confined to the part for ever. And when the part thus affected really embraces a majority of the population, three-fourths of the judicial business, and all of the centres of trade, commerce, and manufactures, it is very clear that the remotest district must catch something of the contagious influence. After the frightful warning we have had, the judicial ordeal through which we have passed, and the cruel wrongs that have been inflicted by that branch of our State government which all civilization designates as the bulwark against wrong and oppression, any man who from fancied isolation can say that the evils of an elective judiciary are no concern of his, has certainly something wrong in both intellect and moral nature.

So far as facts are involved, it is idle to rehearse them. Facts, such as have not disgraced our Anglo-Saxon civilization for two or three hundred years, if there was ever a parallel to them, have been spread before the public everywhere by the press, and authenticated by official investigation. We may, however, say that while the evil

was intensest in this city, and was brought out by a persistent bar and a powerful metropolitan press, it has not been confined to the city. It is true that here the abuses actually reached the enormity of becoming a system, but weak judges, improper influences, and a partial administration of both civil and criminal justice, have occurred elsewhere under our elective system, and so frequently and to such an extent that the system is properly chargeable with them. How hard it is to establish such charges, how tardy and timorous the bar is about making them, we have all seen demonstrated here, where the burden had become unbearable. But how many wrongs have fallen in isolated cases upon the weak and the poor and upon the community where criminal jurisprudence is involved, nobody can surmise. We all believe that there have been bad judges upon the bench out of the First Judicial District, but not bad enough or bold enough to arouse the necessary storm which seems a condition precedent to official punishment.

If any man can persuade himself that "what has been" is exclusively the fault of this community, and not of the elective system, and that it need not happen again, let him seriously look at the inherent advantages and disadvantages of the two systems. First let him apply to them the tests of success and failure. The old system gave us sometimes great jurists and always good judges. Such men as Livingston and Kent and Spenser, it is true, are not to be found every day by any system, and will be regarded by most persons as peculiarly men of their time. No system can be expected to create great men, and we can ask nothing more than that it shall select the best. This the system by appointment did, its latter days showing no decadence, but yielding judges to whom the bar now looks back with reverence, of whom it will be sufficient to name Jacob Sutherland, Samuel Nelson, Greene C. Bronson, and Reuben H. Walworth. The new system has not only given us Barnard and Cardozo, but Fisk and Tweed and Mills and Carlton and Phelps. The crop of embezzlements and defalcations and frauds which we are reaping flourishes, as it always has done and always will, under the favoring influence of a weak or corrupt judiciary, to say nothing of the vulgar crimes committed by ward politicians and men of "influence." By the elective system we notify the rogues in the community that the judiciary is weak; that they have a certain hold upon it; that they may bestow favors, which is tantamount to expecting favors; and that "men of influence" who make judges will in case of necessity be able to say something to them. That such expectations are absurd in the majority of cases does not mend the matter. If we build the judicial system so low that every vagabond in the community by merely reaching out his hand can directly touch it, we make it more or less accessible to men who ought to look up to it as something altogether beyond their reach.

In the next place should be considered the matter of reappointments. Since the elective system began, now about twenty-five years, the ablest judges in the State, with hardly an exception, have been dropped from the judicial roll. Some have been defeated in conventions, others at elections, and a few have been too much disgusted with a first election to submit to a second. Such losses have always been a matter of regret to the better portion of the community, but a matter beyond control. An individual responsibility in selecting would go a great way toward preventing such losses in the future. The moral power of the community will reach a Governor when it will be a harmless blank-cartridge for a convention.

We may next note the fact that conventions, although imbued with all the wisdom of all the people, are not deliberative bodies. Assuming that every delegate leaves home with the most patriotic emotions in his heart, and the best of candidates in his mind's eye, it is still possible that when he reaches the convention he will find his candidate withdrawn, or objectionable to the majority, or unknown to everybody but himself. There is no time then for consideration or enquiry; an immediate choice is necessary; he cannot go home and write letters to the leading lawyers for their opinions before he decides; and it follows that he takes the candidate whose "friends" are most active and numerous. Finally, the Governor and Senate are in this matter a responsible somebody. Conventions are the nobodies of political life. They come and go, doing much political mischief, but never can be held to a responsibility reaching beyond the next election. Individual responsibility for a bad judge is a load which no man will lightly put upon his own shoulders. But responsibility shared among a mass of men we all know to be worthless; and experience indicates that conventions are as soulless as corporations.

THE PAYMENT OF INTEREST ON DEPOSITS.

NOW that the public has time and inclination to study the causes of the late disastrous financial panic, it is well to ask if the investigation shows any defect in our national-bank system which Congress can properly be requested to correct. It is evident that such a defect, susceptible of correction in such a way, can be at once named: it lies in the custom of allowing interest on deposits in national banks made by persons or by other banks; and the remedy is the prohibition by Congress of the payment of such interest.

The Comptroller of the Currency, in his report for 1872, has so clearly stated the matter (pp. xix.–xxi.) that we cannot do better than to quote his words—words which seem almost prophecies in the light of the events of the past month:

> "The act requires that the country banks shall hold an amount of reserve equal to fifteen per cent. of the entire amount of their deposits and circulation, three-fifths of which reserve may be on deposit with national banks which are their agents in redemption cities. The national banks in the redemption cities must hold a reserve of twenty-five per cent., one-half of which may be on deposit with national banks in New York City."

The reserves of the national banks out of New York have been so largely held in that city that these New York banks held deposits during most of the year 1872 equal to more than one-fifth of the capital of all these outside banks. These deposits are "attracted thither largely by the payment of interest" on them. As the Comptroller adds:

> "The banks in the city have no legitimate outlet for these funds, and are therefore threatened with loss. . . . The Stock Board takes advantage of this condition of affairs, speculation is stimulated by the cheapness of money, and a market is found for the idle funds upon doubtful collaterals, and the result is seen in the increased transactions at the Clearing-House, which, during the past year, exceeded thirty-two thousand millions of dollars, or an average of more than $100,000,000 daily, not one-half of which was the result of legitimate business; the total amount of transactions being greater than that of the Bankers' Clearing-House of the city of London."

We have cited the Comptroller as being the highest authority, and also with the intent to recognize the fact that he has already pointed out this radical error; later, we will speak of the remedy he suggests. The danger, he foresaw, was in the dealings between banks. Thus, a bank in Boston or Philadelphia ought to keep a reserve in greenbacks equal to twenty-five per cent. of its liabilities. But on this amount it can earn no interest. The law now allows it to put one-half of these greenbacks on deposit with a New York bank, which will allow it generally four per cent. interest. The receiving bank must, however, lend this money to obtain wherewithal to pay the interest to its depositor, and so it places three-quarters of it among its other loans. The Boston bank, therefore, instead of holding a reserve in greenbacks equal to one-quarter of its liabilities, has but one-eighth *sure*, and the other one-eighth is loaned through its agent. That is, if the New York bank does no other business, it is useless to call this reserve a real one; and if the New York bank does receive other deposits and do other business, the Boston bank must take its chance with the other creditors.

Undoubtedly, the provision of the law was supposed to refer primarily to money kept by outside banks in New York for the redemption in greenbacks of their own particular bank-bills. Experience has shown that this supposed necessity of redemption does not exist. As a rule, every one is as well satisfied with a national bank-bill as with a greenback, and no redemption is asked. But this bait of the payment of interest on the reserve has served to draw all the unemployed money of the country to New York, since the system of payment has been extended to all other deposits. We will, therefore, look at the larger question of the payment of interest by the banks to their individual depositors. In all the larger cities this custom

has gained ground rapidly during the past two years. An ambitious bank president aims to earn more than seven per cent. for his stockholders. He desires large deposits, because his bank receives the profits on the loans based upon them. But with competition between the banks there comes the necessity of dividing earnings with the depositor by allowing him some interest on his money, and then, as we shall see, the functions of the bank are radically changed. Very soon, indeed, the margin of profit is passed, and the banks make no money by thus obtaining deposits. If they have paid their depositors four per cent. on the whole, and could loan only three-quarters, they have paid really 5⅓ per cent. on the part they could loan. Their profit was only on the difference between 5⅓ per cent. and the rate at which they made loans—say 7⅓ per cent. In other words, if a depositor left $100,000 with them for one year, they ran all the risks of employing it for $2,000, out of which must come taxes and expenses. The result of this system has been to prepare the way for just such a panic as we have seen. The depositors, receiving a very reasonable rate of interest, have allowed their money to lie in the banks, which have been obliged to force their loans upon their borrowers in dull times, and, consequently, to take dubious securities in order to earn the interest they had covenanted to pay. When the crisis of a panic came, these large depositors saw chances for investments, and so called in their loans, or were themselves panic-stricken, and rushed in for immediate payment, so as to hoard greenbacks.

In point of fact, by the payment of interest on deposits, the national banks had become "savings-banks for capitalists" on a large scale. Unfortunately, they were not protected by those wise rules which prevent an ignorant multitude from making a run on "savings-banks for small deposits," and, moreover, their modes of investment were far more dangerous than those employed by the regular savings-banks. In truth, during the September panic, the populace behaved with a judgment and decorum most creditable to them, when the millionaires were precipitating a general ruin in the attempt to draw *their* deposits from *their* savings-banks. Now, there is clearly no necessity for the national banks to take up the savings-banks' department. They earn enough money without trying to gain more by borrowing money to lend again. So much for *their* rights in the matter. Again, it is not a matter of necessity that they should take this agency branch of business as a public benefit. If the capitalist could not obtain interest on his deposits from his bank, he would make his own investments, or he could easily obtain a proper agent. With ordinary savings-banks the case is different; the earnings and savings of the poor must be collected and combined before they amount to enough to afford to pay the agents who invest them. But the depositors in national banks are not of this class; they can obtain agents elsewhere, and in no sense *need* to employ these banks for this purpose. It is, too, for the public interest that all the natural increment of property should be invested in substantial property; and this is usually best done by its employment in fostering local improvements and constructions, or in aiding legitimate manufactures and commerce. In simpler words, it is better that Brown's surplus means be employed in building houses or in aiding his neighbor's trade or manufacture than in margins on Wall Street. Besides, as the banks are entrusted with the important and delicate duties not only of distributing capital among proper borrowers, but of maintaining the popular confidence in our circulating medium, it is unwise, imprudent, and highly reprehensible for them to undertake other functions, as those of savings-banks, either for the pecuniary gain to themselves or for the convenience afforded to the capitalist.

Is there any doubt, therefore, not only of the impropriety of this custom, but of the right method of its prevention? A brief amendment to the existing law, and one certainly within the powers of Congress, can stop it at once. If the national banks be prohibited from allowing any interest on any and all deposits, the banks in the large cities will keep their whole reserve at home in greenbacks, and the capitalist will find some mode of investment without invoking the aid of the local banks. This one amendment to the law will go a great way towards curing the defects of the system. The Comptroller, indeed, says that this payment of interest on deposits is "an old-established custom, which cannot easily be changed by legislation." This objection can have little weight, since our national banks are peculiarly the creatures of legislation, and since there can hardly be any strong ground of objection to the abolition of this custom. The remedies proposed by the Comptroller are, either to limit the loans of banks to thrice their capital, or to have part of the reserve kept in Government stock at a low rate, say three per cents. The first is surely a more violent remedy than the one we propose, and we doubt if it would be as efficient. The other, of course, has no bearing upon our dangers in panic times, as what is wanted then is a reserve of greenbacks, not bonds.

We may fairly say, then, that Congress has a duty to perform when it meets again, and that is to prohibit at once the payment by national banks of interest on deposits. In other words, it has to admonish the national banks that they are not savings-banks, and cannot be allowed to try to act as such.

Correspondence.

SOME LITERARY COINCIDENCES.

To the Editor of the Nation:

Sir: On turning over the leaves of Mary Clemmer Ames's recently published 'Ten Years in Washington,' I was struck by the remarkable coincidence between the style and matter of certain chapters thereof and sundry magazine and newspaper articles on the same topics which have from time to time appeared. The resemblance is doubtless purely accidental, as there is no acknowledgment of Mrs. Ames's indebtedness to the authors of these articles in the preface to her book, nor the customary use of inverted commas in the chapters where the coincidences occur. As most persons have a strong zest for "literary coincidences," I venture to lay before the readers of the *Nation* some of the most striking of those to which I have referred:

From 'The United States Treasury Department.' By Colonel Thorpe, in *Harper's Magazine* for March, 1872.

"The first official act of the Treasury Department of national interest, dated at Washington, was one of great prospective importance. It directed that the Secretary should make an annual report to Congress of the state of the finances of the nation, embracing estimates of the public revenue and expenditures, as well as plans for improving and increasing the revenue." (Page 490.)

"The Administration of Albert Gallatin was distinguished by a series of reports regarding the best method of cancelling the national debt, the proper policy of disposing of the public lands, and the legality and necessity of establishing a national bank." (Page 491.)

From 'An Hour among the Greenbacks.' *Scribner's Monthly* for April, 1873.

"Through this division, and under these skilful fingers, has passed every note, whether legal-tender or fractional, which has been issued by the United States since the beginning of the rebellion—every note which we have ever handled or seen—as well as all the gold notes, and many millions of imperfect bonds and notes which were never put in circulation. . . . The notes, after having been counted, are securely put up—the legal tenders in strong paper wrappers and the fractional currency in stout paper boxes—sealed, placed in a capacious hand-cart, and trundled away to the vaults of the cash divi-

From 'Ten Years in Washington.'

"The first official act of the Treasury Department of national interest, dated at the national capital, directed that the Secretary should make an annual report to Congress of the state of the finances of the nation, containing estimates of the public revenue and expenditure, as well as plans for improving and increasing the revenues." (Cap. XXXIX., page 294.)

"Albert Gallatin marked his Administration by a series of reports regarding the best method of cancelling the national debt, the proper policy of disposing of the public lands, and the legality and necessity of establishing a national bank." (Cap. XXXIX., page 295.)

From 'Ten Years in Washington.'

"Through the fingers of these ladies has passed every note—legal-tender or fractional—which has been issued by the United States since the beginning of the war of the rebellion. Every note ever touched or seen, with all the gold notes and the millions of imperfect bonds and notes never put in circulation—every one has passed through these same deft fingers. . . . As soon as the new money is counted, it is again put away—the legal tenders in strong paper wrappers, the fractional currency in paper boxes. All are sealed, put on a hand-cart, and rolled off to the vaults of the cash division,

sion, whither we will now follow them." (Pages 659, 660.)

FROM 'WHERE THE MONEY GOES.' BY S. M. B., IN THE CHICAGO *Inter-Ocean*, JULY 30, 1873.

"After the dreadful days of October, 1871, 203 cases of burnt money were sent to the Treasury from Chicago, aggregating, according to owners' valuation, $164,997 98 legal-tenders, National, State banks, and fractional notes, bonds, certificates, and coupons, internal revenue and postage stamps burned . . . all so shrivelled, charred, and defaced, that the fragments crumbled at the touch, and defied unaided eyesight. A committee of six ladies was selected to identify these notes. Infinite patience, extreme care, experience, and good sight, made sharper by long practice, were the requisites, and their success was the best proof of their qualifications."

"To this furnace, lined with shavings beforehand, the boxes, sealed in the Register's and Secretary's bureaus, and those sent by the committee of three, are brought. Here, in presence of the burning committee, the seals are broken, the complicated locks opened, and the packages are thrown in, each 'lot' being called and checked off by the committee, the average being about $1,500,000 every other day. Besides the cancelled money, internal revenue and postage stamps, checks, and new money defectively printed, are all burned in this furnace. About $100,000 National bank-notes are burned in another, smaller and separate."

whither we still, you and I, pursue our little dollar." (Cap. XXXII., page 328.)

FROM 'TEN YEARS IN WASHINGTON.'

"After the great Chicago fire, in 1871, cases of money to the value of one hundred and sixty-four thousand nine hundred and ninety-seven dollars and ninety-eight cents were sent to the United States Treasury for identification. They consisted of legal-tenders, National State bank [*sic*] and fractional notes, bonds, certificates, and coupons, internal revenue and postage stamps, all so shrivelled and burned that they crumbled to the touch, and defied unaided eyesight. All these charred treasures were placed in the hands of a committee of six ladies for identification. What patience, practice, skill were indispensable to the fulfilment of this task, it is not difficult to conjecture." (Cap. XXXIV., page 351.)

"To this furnace, filled with shavings in advance every day, comes the 'burning committee,' bearing the boxes of doomed dollars, sealed finally in the Register's and Secretary's bureaus. . . . In their presence the final seals are broken—the complicated locks of the furnace opened. Then the packs are thrown into the flames, each 'lot' being called and checked by the committee, the amount averaging about one million five hundred thousand dollars every other day. At the same hour, about one hundred thousand dollars in National bank-notes are burned at another and smaller furnace. Besides cancelled money, internal revenue and postage stamps, checks and defective new money are all consumed in this furnace." (Cap. XXXII., pages 337, 338.)

And so on, with greater or less similarity, for three or four chapters. I have not explored current literature in this direction sufficiently to say whether the same remarkable parallelism extends to any other articles on the subjects of which the book treats; but enough has been quoted to prove either some very wonderful "literary coincidences" or that the acknowledgments in Mrs. Ames's preface should be considerably extended.

SARTOR RESARTUS.

WASHINGTON, D. C., October 13, 1873.

THE DISTRIBUTION OF THE MONEY PAID UNDER THE GENEVA AWARD.

TO THE EDITOR OF THE NATION:

SIR: You have recently referred with approval to the article in the last number of the *American Law Review* containing a strong argument in support of the claims of insurance companies and others to the money recently paid to our Government by Great Britain under the Geneva Award. When the question is argued as in that article, and previously in other articles in your own columns, upon the legal principles which would apply in an analogous case between individuals, the position of these claimants would seem to be unassailable. But in the consideration of this question we are not necessarily confined to legal principles or legal analogies. The rules of law, though originally devised in the interests of justice, do not always lead in their application to the most equitable results, and I have been led seriously to doubt whether in this matter the legal view be the true one, and whether a less technical and more rational treatment of the question may not lead to an answer very different from that given in the articles above referred to. With the parties who have advocated the retention of the fifteen millions in the national treasury, and with the arguments advanced by those parties so far as they have come to my knowledge, I have felt but little sympathy; but it has seemed to me that there were other arguments, hitherto, so far as I know, not clearly and fully presented, which may show the position taken by those parties to be sounder and more respectable than it has hitherto appeared to be, perhaps even to themselves. At all events, whether the arguments which I present be sound or fallacious, it is fair to presume that the cause of truth will be promoted by an honest statement and consideration of them.

The large majority of the original losers by the depredations of the *Alabama* and the other vessels for whose doings Great Britain has been held to be responsible, having been insured, and having recovered indemnity from their insurers, it has been generally admitted that in all such cases the original loser has lost his claim to share in the distribution of the fund. But when it is proposed, in accordance with legal analogies, that the insurer shall succeed to the rights of the original owner of the vessel or cargo destroyed, whose loss he has made good, it is strongly urged in opposition that the effect of this course would simply be to pay over the greater part of the fund to parties who are not in fact losers by those depredations. The insurance companies went into the business of insuring against the risks arising from the rebel cruisers on ordinary business principles. They graduated their premiums according to their ideas of the character of the risk. They intended to fix those premiums at such a rate that the sum total of all the premiums received should be sufficient to pay all the losses and leave a handsome surplus for their own compensation, and most, if not all of them, undoubtedly succeeded in securing a profitable result. If the damage caused by the rebel cruisers had been covered by the ordinary policies, and if that damage had happened suddenly, without warning, and without any opportunity being afforded to insurers to anticipate it and to graduate their premiums accordingly, in such case the insurers would indeed have been losers by the depredations of those vessels; but as the facts really stand, those vessels were to them merely the cause of an *increase of business*, and, it is fair to presume, of a consequent *increase of profits*. Under these circumstances, their *equitable* claim to pocket the greater portion of this large fund would seem to be decidedly weak.

It is urged, however, that if the claims of the insurers are not good in equity, the parties who paid to those insurers the premiums for the war risks are the real losers, and, as such, the legitimate claimants of this fund. But a slight consideration will show that the extra cost of insurance paid by owners of vessels and cargoes was merely an item which served to increase the price of the charter of a vessel and the rate of freight of a cargo, and thereby to increase the cost of an imported cargo when landed on our shores, and to diminish the price which an exporter could afford to pay for a cargo to be sent to foreign countries. Here, at last, however, we seem to find the clue by which to trace to the real sufferers the losses caused by the rebel cruisers. These sufferers were in fact the great mass of the people of the United States, who, by reason of the increased risks to which commerce was subjected, were compelled to pay higher prices for their tea and their coffee and for all other foreign articles, and to accept smaller prices for the grain and flour and other things which they produced or manufactured at home.

If, as the foregoing considerations would seem to show, the great mass of the people of the Union are in fact the parties to whom the loss caused by the rebel cruisers is in the final analysis to be traced, then the fifteen millions paid by Great Britain have already in the United States Treasury reached their proper destination, and need no further distribution. The value of the vessels and cargoes destroyed was, in this view of the matter, properly presented to the Tribunal at Geneva as affording the best evidence and the most accurate measure of the damage inflicted. The money compensation received by the Government on account of that damage ought certainly by every principle of justice and honor to be paid over so far as possible to the parties who actually suffered the damage; but when we endeavor to find out who are to-day the real sufferers on whose shoulders the damage now rests, do we not see that they are not the original owners of the vessels and cargoes destroyed, for they were long ago indemnified by their insurers—they are not those insurers, for their part in the matter was merely that they made a profitable business of collecting in war premiums from the great body of shipowners and merchants the money with which they indemnified the immediate losers—and, finally, they are not the great body of those who paid war premiums, for the reason that for whatever moneys they paid out in such premiums they indemnified themselves out of the pockets of all who bought of them any article they had imported, or sold to them any article which they desired to export? If, then, the loss cannot be traced to any one class or body of men, but appears to have been distributed generally among the people of the Union, the indemnity received for that loss will most nearly reach those who are justly entitled to profit by it if it is left in the National Treasury, to be applied to the payment of the debt which the people of the Union now owe.

U. H. C.

[There are two, and as it seems to us tolerably plain, answers to the above. The first is, that if the underwriters suffered no loss or damage by the Confederate cruisers, we ought never to have brought

their claims before the Geneva Tribunal. Having filed and proved them, and demanded and obtained a large sum of money from Great Britain on account of them, it is clear that it is not now open to us to declare that they had no foundation. Conduct of this kind on the part of private persons is punishable in the criminal courts, and bears a familiar name.

The second answer is, that the loss suffered by the people of the United States through enhanced rates of freight is in large part imaginary and wholly incapable of proof; and that if it occurred to the extent alleged, it was ruled out as "indirect" by the Tribunal at the very opening of the proceedings. Therefore, the money is not applicable to it. But it did not occur. The effect of the *Alabama* raids was not to raise freights generally, but to drive American ships out of the market. The American shipowners were not able to add the war risks to their rates. They had either to suffer the loss, transfer their ships to a foreign flag, or abandon the business. The carrying trade thus fell into foreign hands almost wholly, and was conducted through the war at rates regulated by the ordinary competition between shippers. There may have been some loss suffered by the American people on this score in the coasting trade, but it was very trifling, trade with the Southern ports having been wholly suspended, and that along the New England coast very little exposed. The California steamers perhaps raised their rates, but their war risks hardly amounted to $15,000,000. In fact, we advise "U. H. C.," and every other honest man, to leave this matter in the hands of "the Essex statesman." There is but one legitimate disposition to be made of the money, and all attempts to wriggle out of it in a cloud of metaphysics only help to damage the national reputation abroad, and injure our credit in the foreign money markets.—Ed. Nation.]

Notes.

Hurd & Houghton announce, in addition to the 'Egyptian Sketch-Book,' by Charles G. Leland, 'The English Gypsies and their Language,' by the same author. Also, 'Seven Historic Ages: Talks of Kings, Queens, and Barbarians," by Arthur Gilman.——Porter & Coates will publish 'In the Days of My Youth,' by Amelia B. Edwards; and Lord Derby's version of the Iliad, with a biographical sketch of Lord Derby by R. Shelton Mackenzie.——A. D. F. Randolph announces 'The Literary Life,' by Francis Jacox.——We have received from Justus Perthes, the eminent geographical publisher of Gotha, Parts 7, 8, and 9 of the new edition of Spruner's 'Hand-atlas for the History of the Middle Ages and of Modern Times.' We have already, on receipt of the same from B. Westermann & Co., enumerated the maps which they contain, but we are glad to have another opportunity of calling attention to this standard work, which no student of history and no library can afford to be without. These three parts depict the whole of Western Europe at different periods, Part 8 being given up to Germany exclusively.——We are glad to find it stated in the *Publishers' Weekly* that the Messrs. Appleton will collect and publish in one volume the extremely interesting papers on "French Home Life" which have appeared in *Blackwood*, and of which we have more than once made mention in the *Nation*.

—Mr. Herbert Spencer's papers on "Sociology" are, we understand, to appear in the form of a book during the coming autumn, and we may say for them in advance that they will form one of the most important books of the year. They have attracted, as they have appeared, more attention than Mr. Spencer's previous writings, probably because they are on a subject which, to the average reader, is doubly interesting, from the fact of its being a very ancient and, at the same time, very new one; ancient, as it relates to our old and familiar friend, man, and new, because it discusses man, his life and his habits, not in the sentimental or empirical way, but in the cold-blooded fashion with which science now approaches everything. Besides these reasons for greater popularity, there is in a good many persons' minds a lingering feeling, inherited from the generation to which Franklin and his fellow-philosophers belonged, that science and philanthropy together were, in the course of time, to furnish the key to happiness; that with a proper amount of crucibles and retorts, there was no reason why all men should not be as calm and happy as the philosopher who benefited coming ages by inventing the lightning-rod. There was certainly no sociology in those days; scientific men looked forward to a moral through a natural millennium; but their successors, who began the erection of a sociological structure by the discovery of the general laws of political economy, began to dream of a millennium which should be brought about by the disinterested study of the science of man himself. Most of these dreamers have since awoke to the harsh reality on which Mr. Spencer, in his current article, strikingly dwells—the fact that scientific progress is one thing, and moral progress another; that the cultivation of the mind and the growth of knowledge do not produce necessarily that moral force which, though it may not secure, is certainly essential to, happiness. There is undoubtedly a fallacy, as Mr. Spencer points out, in supposing that good citizens can be turned to order out of a national educational mill, as they are in theory out of our common schools with us, and as certain reformers wish they should be turned out in England.

—The recent convention of women adjourned without taking any notice of an attack which the accomplished secretaries of that body might well have been directed to throw into the form of a Syllabus of Condemned Propositions, to be used as a guide by the faithful in all lands. We refer to an article which Mr. Orestes Brownson publishes in the last number of *Brownson's Quarterly Review*, under the title of "The Woman Question." It might be formulated in some such way as this: "Whosoever shall say, 'We recognize woman's merits as a religious, as the head of communities of nuns, and as wife, mother, daughter, and domestic friend, for this reason—that in all such relations she is under the direction of male superiors'—let him be anathema." Another article might read thus: "If any man shall say, 'A woman has a thousand ways in which she can annoy her husband, and even her father, and render his home a hell upon earth, and all the time appear to be the victim of his coarseness and brutality, and be regarded by all her neighbors, especially her male neighbors, as a meek, gentle, sweet-tempered, suffering angel'—let that man be anathema." Still a third might be worded thus: "Whosoever shall publicly assert and maintain, or shall privately believe, that 'Neither sex should be set against the other, for each has furnished examples of terrible depravity, and each has peopled heaven with innumerable saints and martyrs, and the one sex is as good as the other, but woman is physically and mentally the weaker vessel'—let him become a castaway, and let his name rot." "Or if any man shall say that under our present laws in most of the States the wife is practically independent of her husband, and if he breaks a tea-cup or a saucer which belongs to her, she can sue him for damages—let him be anathema; and so, also, of any man who shall say that the woman movement 'means free-love, and seeks to substitute what it calls love for duty and obligation.'" All these things, and many more like them, Mr. Brownson says with great downrightness. As, for instance, the following, which is one of many, and picked at random: Include women among the political people, and "they would lose all they owe to man's chivalry, which is not a little, though greatly diminished since women have aspired to lead in popular literature; for women by their writings have deprived the sex of much of its prestige, and womanhood of its sacredness." Mr. Brownson calls names, too, specifying what female reformers have of his own personal knowledge become "coarse and termagantish" since they began to agitate, and what ones have given him personal proofs that their tongues were "harder than many men's fists." But into this part of his field of labor we need not follow him.

—Among recently-printed English works, there are few of any special value. A very special value, indeed, attaches to the 'Bibliotheca Anti-Quakeriana,' by Joseph Smith, himself a Friend, and author six years ago of a bibliography of books written by Quakers, filling some two thousand pages. The present work adds to the alphabetical catalogue biographical notices of the authors, and in certain cases the answers made by Friends. Various tastes are appealed to by 'The Vaudois of Piedmont,' a visit to them, and a sketch of their history, by the Rev. J. M. Worsfold; the 'Life of Louisa de Carvajal,' by Lady Georgiana Fullerton; the 'Autobiography, Memoir, and Letters of Henry F. Chorley,' for many years musical critic of the *Athenæum*, by H. G. Hewlett; 'Our Journal in the Pacific,' by the officers of H.M.S. *Zealous;* and a desperate sanitarian's production, entitled 'What a House should be *versus* Death in the House,' by William Bardwell.

—Chief among the fall announcements, which now begin to be made plentifully on the other side, is Mr. Mill's Autobiography; and in the same line we note the following titles: 'Life of the Right Hon. Spencer Perceval,' by his grandson, Spencer Walpole, comprising Mr. Perceval's correspondence with most of the distinguished persons of his time; Lord William Pitt Lennox's 'Recollections from 1803 to 1873': 'Essays in Military Biography,' by Col. C. C. Chesney; 'Distinguished Persons in Russian Society,' from the German, by Frances E. Bunnètt; and a 'Dictionary of Artists of the English School,' in all branches, by Samuel Redgrave. The second volume of Mr. John Hosack's 'Mary, Queen of Scots, and her Accusers' will embrace a narrative of events from the death of James V. in 1542 to the death of Mary in 1587. We are to have also the fifth or "Inkerman"

volume of Kinglake's 'Invasion of the Crimea'; 'Incidents in the Sepoy War of 1857–8,' from the private journals of Gen. Sir Hope Grant; 'The Norman People, and their existing Descendants in the British Dominions and the United States'—a work which Dr. Freeman will probably cherish in company with a lecture by Rev. R. Polwhele on 'The English the Descendants of the Ten Tribes'; 'The Fenland, Past and Present: its History, Geography, Geology, Antiquities, etc.,' by S. N. Miller. The fruits of recent German explorations are to be made accessible to the English reader in Dr. Schweinfurth's 'Travels and Discoveries in Central Africa, from 1868 to 1871,' for which Ellen E. Frewer furnishes the translation, and Mr. Winwood Reade (just made the *Times* correspondent for the Ashantee war) the introduction; and Mr. Reade also edits Dr. Gerhard Rohlfs's 'Adventures in Morocco, and Journey South through the Oases of Draa and Tafilet,' while Mr. H. W. Bates condenses and edits the narrative of the Second North-Polar Expedition (1869–70) of the *Germania* and *Hansa*. The North Pole is the subject of 'The Threshold of the Unknown Region,' by Clements R. Markham, editor of *Ocean Highways;* Africa, again, of 'Life, Wanderings, and Labors in Eastern Africa,' by the Rev. Charles New, of the Livingstone Relief Expedition; and pretty familiar ground will be gone over in 'The Pearl of the Antilles, or an Artist in Cuba,' by Walter Goodman, for many years a resident of the island, and 'The Alps of Arabia'—travels through Egypt, Sinai, Arabia, and the Holy Land, by William Charles Maughan. Somewhat fresher will be 'Rough Notes of a Visit to Belgium, Sedan, and Paris, in September, 1870–71,' by John Ashton; 'A Journey to the Mishmee Country,' by T. T. Cooper, who attempted to penetrate Thibet from Assam; and 'A Phrenologist among the Todas, or the Study of a Primitive Tribe in South India,' by William E. Marshall. Mr. James Greenwood's 'In Strange Company, or the Note-book of a Roving Correspondent,' gives no hint of the localities visited, but is almost certain to be entertaining.

—Everybody can affect an interest in 'A Handbook of Weather Folk-Lore,' a collection of proverbial sayings in many languages, by Rev. C. Swainson; and 'Economic Geology, or Geology in Relation to the Arts and Manufactures,' by David Page, will recommend itself somewhat widely. Haeckel's 'History of the Natural Creation,' done into English; St. George Mivart's 'Man and Apes, an Exposition of Structural Resemblances and Differences bearing upon Questions of Affinity and Origin'; and Alexander Bain's 'Mind and Body, and the Theories of their Relations,' are so many contributions to the greatest of living scientific discussions, the descent of man. After these it is in order to name Stuart-Glennie's 'West-Eastern Memories; or, Travel and Discussion in the Birth-countries of Christianity with the late Henry Thomas Buckle.' Finally, we may mention Rev. Stopford Brooke's 'Theology in the English Poets'; 'Essays on Freethinking and Plainspeaking,' by Leslie Stephen; 'How to Amuse and Employ our Invalids,' by Mrs. J. P. Powers; 'Etruscan Researches,' by Rev. Isaac Taylor, author of the useful and learned little work on 'Words and Places'; a 'History of Music,' by William Chappell, with a chapter on Hebrew music contributed by Dr. Ginsburg; and a translation of Schiller's 'Don Carlos,' by Dr. Andrew Wood of Edinburgh.

—We single out the announcement of a translation, from the German, of Prof. Vámbéry's 'Central Asia and the Anglo-Russian Question' in order to remark that, in the last number of the *Athenæum* (October 4), there is a letter seriously impeaching his veracity from Mr. Eugene Schuyler, our Secretary of Legation at St. Petersburg. Mr. Schuyler writes from Bokhara under date of August 12, and proposes "to say a few words respecting those writers who are the chief authorities for our knowledge of this country." We omit his remarks on Meyendorf, Burnes, Khanikoff, and other travellers more or less trustworthy; but this is his judgment (as a Russophile, doubtless) of the Russophobist professor:

"As to the books of Vámbéry, the most noted of modern travellers, they are nearly worthless. I have not yet been able to make up my mind whether Vámbéry was actually here or not. There is little, if anything, to be found in his 'Travels' and 'Sketches' which is not told us by other writers, and the errors are so frequent and so great, that it would seem impossible for a man to make them who had seen with his own eyes the things of which he speaks. . . . Most of the Russians who have had the best opportunities of studying these countries, do not believe that Mr. Vámbéry was ever here. . . . Of his more ambitious and scientific books, the less said the better. 'Catagaische Sprachstudien' is utterly useless to the philological student, as it is one mass of error. There is no language bearing the name of Tchagetai, and the language which Mr. Vámbéry endeavors to illustrate, while certainly not what is spoken here at Tashkent or in Kokan, bears more resemblance to the dialect of Kashgar than anything else. . . . The errors in the 'History of Bokhara' are so great and so frequent, especially in those parts (such as the account of the Russian advance in Central Asia) for which abundant materials are accessible, that one is surprised that the writer should have undertaken the work."

Mr. Schuyler fortifies his criticisms by numerous examples which we lack the space to reproduce here, and which seem likely to make it rather difficult for Vámbéry to reply, as the *Athenæum* invites him to do.

—Our readers will be glad of a suggestive passage which we have chanced on lately in reference to a discussion in our columns (*Nation*, vol. xiv., pp. 392, 421; vol. xv., pp. 9, 27, 44) as to an alleged want in the French language of a word corresponding to the English "listener," meaning listener in a conversation and not *auditeur*, which is accepted as sufficient when a public address is in question. The assertion that in French the obvious word was an equivalent is confirmed indirectly by the extract. The quotation is given in a translation, but *écouter* is undoubtedly the verb which the writer, Mr. N. W. Senior, translates. It is somewhat odd that Mr. Senior, instead of imagining that *écouteur* does not translate "listener," starts from the other side, and hesitates to render *causeur* into English. The passage is from the 'Correspondence and Conversations of Alexis de Tocqueville with N. W. Senior, from 1834 to 1859,' vol. ii., p. 171. The journal of the conversations, it will be understood, was kept by Mr. Senior in English. It would be a little more satisfactory to have just this passage in the original; but Mr. Senior, by giving us the French for "converser," furnishes a weighty presumption that there is no difficulty in rendering "listener" by the proper word:

"The fault of her conversation [Mrs. T——'s]," I said, "seems to me to be, that while she is repeating one sentence she is thinking of the next, and that while you are speaking to her she is considering what is to be her next topic. I have noticed this fault in other very fluent conversers. They are so intent on the future that they neglect the present."

"It is rather a French than an English fault," said Tocqueville. "The English have more curiosity and less vanity than we have; more desire to hear and less anxiety to shine. They are often, therefore, better *causeurs* than we are. *Le grand talent pour le silence*, or, in other words, the power of listening, which has been imputed to them, is a great conversational virtue. I do not believe that it was said ironically or epigrammatically. The man who bestowed that praise knew how rare a merit silence is."

"May we not owe that merit," I asked, "to our bad French? We shine most when we listen."

"A great talker," I continued, "Montalembert, is to breakfast with us. Whom shall I ask to meet him?"

"Not me," said Tocqueville, "unless you will accept me as one of the chorus," etc.

—We quote another passage from the same work (vol. i., p. 169), in which the conversational resources of the two languages are further illustrated. Here Mr. Senior and his friends seem to have claimed and conceded too easily the superior politeness and capabilities of the French. "Miss," as a word of address, probably wants the grace and dignity of "Mademoiselle" and its agreeableness; but we cannot understand why "Madam" is not a perfectly satisfactory equivalent of "Madame," and "Sir" to our taste is as good a word, if not a better, than "Monsieur." Both Mr. Senior and Madame Anisson appear to have confounded a conversational attitude or manner with linguistic resources, and to have been rather hasty even here in allowing the advantage to the French. The Frenchman, when he addresses us without remembering our name, may offend our dignity less than an Englishman might under the like circumstances, but is he under no need of "catching our eye"?

"We talked of the want in English of words answering to Monsieur, Madame, and Mademoiselle.

"'What do you do,' said Madame Anisson, 'when you want to attract a person's attention?'

"'You call to him,' I said, 'by his name.'

"'But,' answered she, 'if you do not know his name, can you address anybody by the word "mister," or "mistress," or "miss"?'

"'No,' I said, 'if you do not know the name, you have nothing to do for it but to catch the eye.'

"'With us,' she replied, 'the name is very seldom used, except, indeed, by royal personages. The Queen used to address me as Madame Anisson, to show that she knew my name, but in society it would be bad taste.'"

—A writer in the *Cornhill Magazine* has recently been giving an account of the French periodical press in its early days which is both entertaining and profitable. Among other things that will interest journalists, is the evidence he affords of the venerableness and hoariness of certain usages of our profession which have passed for modern, and even for American. Here, for example, are some "brief jottings" which might readily pass for the production of one of our own countrymen in this city, Cincinnati, Chicago, Louisville, or San Francisco, yet they are from the columns, now more than two hundred years old, of the Parisian *Mercure*, a journal founded by a M. Donneau De Visé so long ago as in 1665. M. De Visé perhaps refers to M. J. B. Rousseau, of whom he was not fond:

"Monsieur J. B. R—— complains that we are blind to his merits. We reply that nature has not endowed us with the faculty of seeing clear through muddy water. But we will resume this discussion when Monsieur R—— has paid his tailor for that maroon coat which he has been sporting so proudly all this month, notwithstanding the two creases in the back, which form its most attractive features."

M. Molière also resembled Rousseau in not being the object of any superstitious veneration on the part of M. De Visé, who was in the habit of asserting in his journal that the Abbé Catin, a personage whom the world has since successfully conspired to forget, was a far abler man than Molière ever thought of being. Thus M. De Visé speaks of the favorite:

"We hear that M. M—— is not happy at our remarks on his last comedy. We pronounced it tasteless; we were wrong. Being plagued with mice, we set a copy of this valuable work near a hole in our flooring; twelve mice came and ate of it, and died in cruel agonies."

We are not informed who the M. "A." of the following "personal item" may have been; but a brief experience of the world is ample to enable one to pronounce it probably destitute of any basis of fact, and intended rather to fill M. "A." with stupefaction and sadness when he read it than to advance any good cause:

"Monsieur A——! Monsieur A——! you have written a Latin treatise on the soul, and a schoolboy copied a paragraph and showed it to his master as his own. He has been whipped for writing nonsense and bad grammar."

Equally malicious, but perhaps not so devoid of truth as the other, is this one, referring to a gentleman whose name has remained unknown for half a dozen generations. Yet one would say that the "personal" had been "set up" yesterday, or kept standing and in constant use ever since 1665:

"A poet who has ruined one publisher, and is fast hurrying a second towards the workhouse, came yesterday and wrote 'Pig' on our door. We thank him for his courtesy in thus dropping his card on us."

Another thing that we learn from these sketches is that, formerly as now, there was a class of literary men whose hearts were lighted up with unholy fires whenever by any chance they encountered a little salutary fault-finding. Writers even of the better class, says our author, "were not slow in taking offence; for it is an unfortunate fact that, from the day when man first put his thoughts to paper, authors have resented any questioning of their talent with curious bitterness. Sallo's criticisms were courteous and temperate, but this made no difference. He was charged with animus, envy, imbecility, and bad taste. When he praised one author, all the others shouted that he was venal, and if he left any one unnoticed, the thing was attributed to an ignoble desire that the scribbler in question should remain ignored." When Sallo, amazed at the mingled ferocity and silliness of the disturbance, attempted to explain that he was not a scoundrel, that his motives were pure and excellent, he was greeted with a general and vociferous shout of derision, and was by-and-by obliged to suspend the publication of his paper, the *Journal des Savants*. In exchange for him, the literary world got the M. Donneau De Visé of whose courtesy and learning we have quoted above some examples which do him justice. We may add that it is in the *Cornhill* for last June and that of September that the reader may find the articles in question, and we believe there are to be more.

PROCTOR ON THE MOON.*

THE author of this work is perhaps the most prolific writer of the day on scientific subjects. Commencing some eight or ten years ago with a book on 'Saturn and his System,' he has continued to write about an octavo volume annually since that time. Many of these volumes must have required an immense amount of reading, research, and calculation. He is also the author of reviews, notices, and essays, which we cannot attempt to enumerate, while hardly a number of the *Monthly Notices* of the Royal Astronomical Society is allowed to appear without two or three contributions from his pen. Looking at such an immense mass of material, the product of a single brain, the first question one would naturally ask is, not whether it is all of the best quality, but whether any of it can possibly be worth reading and study. While it cannot be denied that some of his chapters exhibit marks of hasty preparation, if we compare him with the mass of popular writers on scientific subjects we shall find the general accuracy of his writings to be hardly less remarkable than their number. All his reasoning is that of a thoroughly disciplined mind, possessing a complete understanding of the mathematical relations involved in the problems discussed. As an expounder of scientific truth, his style is well adapted to his subjects. He writes with great clearness, with an enthusiasm amounting almost to impetuosity, and with a fulness of illustration and detail which, though tedious to the scientific reader, will be very welcome to the unscientific one who wishes to understand the subject without that minute study of each sentence necessary in reading the writings of professional investigators. It must be admitted that he sometimes offends the taste of the critical reader by the too free introduction of his own personality, or, we might say, by a kind of headlong running against himself in the heat of discussion; but this is a fault on which his countrymen look with more leniency than we do.

That Mr. Proctor's works are not in every respect what monographs of the kind ought to be, follows necessarily from the simple fact that it is impossible for any one person to do all the reading, study, and examination necessary to know completely all that has been done in any one department during the time that he devotes to the preparation of a book, and, at the same time, to collate the material and prepare the book. We cannot, therefore, expect to find his works marked either by exhaustive research or by such a fair and complete account of the subjects discussed as will stand the closest scrutiny. To a consciousness of this difficulty on the part of the author himself we have probably to attribute the only deficiency we have noticed in the work before us. A brief account of the researches of mathematicians and astronomers since the time of Newton on the complicated motions of the moon would have formed a very important chapter in a work of this character, replete as it would have been with accounts of what might be claimed as the greatest triumphs of the human intellect. It is, therefore, a little tantalizing to have Mr. Proctor tell us that he cannot avoid dwelling on the singular interest of this history, and yet dispose of the whole of it in a single page, which only tells us what a brilliant history it is. To this we must add that he would hardly be a representative Englishman if he did not write of the labors of his countrymen with greater pleasure than of those of foreigners. If we judge his works by the German standard of thoroughness, we shall have to admit that they exhibit very serious deficiencies in this respect; but if we compare them with the average standard of completeness afforded by the great mass of popular scientific writing in England and America, they will be found remarkable for their thoroughness and general fairness. The fact is, there is too much disposition among scientific men, especially in this country, to look upon the work of "popularizing science" as something altogether beneath the dignity of a professional investigator, and thus to abandon the field to such third-rate men as publishers may chance to pick up Of course, the result is that the field is worked in such a way that the really first-class men find ample excuse for refusing to enter it in such bad company; and, partial though Mr. Proctor's works may be toward the ideas and labors of his own countrymen, we know of no others to which the English reader can refer for accounts so good of the recent labors of astronomers of all countries.

In the work before us, the defect here alluded to is much less conspicuous than in some of Mr. Proctor's former writings. But we cannot help animadverting upon the addition to the map of the moon of eighty or a hundred names of persons living now or within the present generation, who are thus ranked among the great philosophers and astronomers of all ages. It is strikingly illustrative of what we have just said, that England gets a larger share of these names than all the rest of the world together. The list includes names so insignificant as those of Goldschmidt and Moigno, and a number of others which we dare not pronounce insignificant, because we never before heard of them. Three have especially excited our curiosity: G. Gwilt, J. Gwilt, and Mrs. Jackson Gwilt. As the name of this favored family is not to be found in the Royal Society's 'Catalogue of Scientific Papers,' their first contribution to science must have been made since 1863. There is a sprinkling of Americans, among them Miss Mitchell, but not one of the four whom good judges would probably agree had the first right to be thus honored, namely, Rittenhouse, Bowditch, Bache, and Peirce. We believe that these additions to the lunar map did not originate with Mr. Proctor, but with one of the amateur astronomers of England; still, we must be surprised that he should have been so far from seeing the presumption and absurdity of a private gentleman naming points in the moon after his male and female friends as to include the names in a map without anything to distinguish them from those already recognized by the astronomical world. Of course, such additions cannot be recognized by any scientific authority.

Nearly half the present work is devoted to an explanation of the phenomena presented by the lunar motions, both that around the earth and that on her own axis. This portion of the work is worthy of unqualified praise, combining, as it does, two qualities seldom found together—the utmost exactness in every mathematical detail with the greatest possible clearness in exposition. It is designed to enable the unmathematical reader to go as far into the comprehension and understanding of the manner in which the various forces which act on the moon affect her motions as the most profound mathematician has ever really been able to go. The marvellous accuracy with which the motions of the celestial bodies are predicted from the theory of gravitation is not attained by direct reasoning upon the mode in which the forces act, but by a calculus, in which their effects are summed up in algebraic and numerical formulæ, and in which the connection between the data and the results eludes the clearest insight. Only a few of the largest inequalities have ever been explained without this aid to thought, and these

* 'The Moon: Her Motions, Aspect, Scenery, and Physical Condition. By Richard A. Proctor.' With three lunar photographs by Rutherfurd (enlarged by Brothers), and many plates, charts, etc. New York: D. Appleton & Co. 1873.

few are explained by Mr. Proctor with a profusion of diagrams which are calculated to make the subject quite clear to any one possessing the faculty of mathematical reasoning. The elucidation of the inequality resulting from the parallax of the sun, and of the motion of the lunar perigee, are worthy of especial attention, as these effects of gravitation seem to have escaped the grasp of Newton himself.

The only error of conclusion which we have noticed is one into which others besides Mr. Proctor have fallen. Some years since, Gussew, of Wilna, concluded from measures of some of M. De la Rue's lunar photographs—fallaciously, we think—that the moon was egg-shaped to a degree clearly visible and measurable, the longer diameter and the sharper end being directed toward the earth. This result has been considered as supporting a well-known theory of Hansen, that the centre of gravity of the moon is some forty miles further removed from us than her centre of figure. Really, however, the measurements of Gussew are directly opposed to this theory; the error arising, at least in the present case, from taking the middle point of the longer diameter as the centre of figure, whereas, in Hansen's theory, the centre of figure is supposed to be that of which the motion is derived from actual observation of the moon's limbs—that is, the middle point of the smaller diameters. When we take this point as that of comparison, we find that Gussew's measurements throw the centre of gravity on this side instead of on the other, as required by Hansen.

That class of readers—a very large one, we fear—who do not care to go through long courses of reasoning on the motion of the moon, will probably find the most interesting chapters to be those devoted to the study of the moon's surface. The total dissimilarity between both the geography and the geology of the earth and moon, is quite striking, even with a small telescope. Not only has our satellite neither clouds, air, nor water, so far as the most delicate researches have shown, but the inequalities of her surface are totally different from anything we see here. She is nearly covered with comparatively shallow, circular basins or pits of all sizes, the interiors of which are commonly smooth and flat, with sometimes a mound rising from their centre. The question whether any change whatever can be detected in any part of her surface has received much attention for several years past, without being brought to a definite conclusion. The evidence on both sides is very fully discussed by Mr. Proctor; but he does not venture upon a decisive answer to the question.

Not the least valuable portion of the work are three lunar photographs, enlarged by Mr. Brothers from negatives by Mr. L. M. Rutherfurd, of New York, who has brought astronomical photography to a state of almost exquisite perfection. We suspect they might have been a little better had Mr. Rutherfurd enlarged them himself; but as they are, they give the best representation of the telescopic appearance of the moon during her different phases which we remember to have seen. The only noticeable defect is that the dark regions are too dark, and in consequence, the separating line between the bright and dark portions much too jagged in appearance.

THE NORTH AMERICAN REVIEW FOR OCTOBER.

THE lightest article in the October *North American* is by Professor Charles Kendall Adams, who deals with the well-worn subject of Napoleonic universal suffrage. He contrives to make it interesting, however; and this he does by being very concrete in his illustrations. On the question whether France should be considered Louis Napoleon's victim, or his accomplice, Professor Adams is decidedly of opinion that she was victimized, and he proceeds to make his opinion good, by showing from the evidence of MM. Taine, Jules Ferry, Taxile Delord, and Ernest Naville what an imperial plébiscite really was. He narrates at length the story of the annexation of Savoy and Nice under the form of a popular vote; and in the general election of 1863 he finds still more numerous examples of force and fraud applied to the electors. If we forget the disgrace of the affair, it is a history not a little amusing. To begin with, the commissioners of police had their orders to prepare the soil for the good seed. Terror was a principal means of persuasion with these gentlemen, who in all cases obeyed with diligence: "They were not content to enter into the house of the peasant; they penetrated into the deliberative assembly of the municipal council, and openly reproached the members if their zeal appeared to decline." An elector of opposition opinions was observed traversing a village of the Gironde with a gendarme on each side of him: "There," says a commissioner, "there goes a partisan of M. Decazes; that is the way we treat them." Whether or not the gendarmes were addressing themselves to this elector's reason is not stated; but presumably they were. That, at all events, is what their superiors were told to do. General instructions were sent to all the prefects, in which M. De Persigny directed that only to the reason of the electors should appeals be made: "Let the people know," said he, "who are the friends and who the enemies of the Empire; and let them have full liberty to decide as they choose, but with a full understanding of the cause." When, however, the prefects came to the business of making nominations, it was declared that "no public discussion of the merits of the respective candidates would be allowed." At a previous election, the people, "in the absence of a general direction," had held preliminary meetings, something like our caucuses and conventions, where the candidates announced their principles and submitted themselves for nomination or rejection; but in 1863 "the administration," said the Prefect of the Haute-Loire, will "fill the office of the preliminary meetings. Disinterested in the question, and representing only your collective interests, it will examine, appreciate, and judge of the candidates who are presented." "In all cases," says Professor Adams, "the Emperor chose the prefect, and the prefect after conferring with the Emperor nominated the candidates. This once done, the contest began, if indeed there were any opposition candidate, which was not in all cases certain. The press had mostly been killed or corrupted, so that there remained few journals not subsidized, and as the "office of the preliminary meetings" had been taken on itself by the Government, it was not an easy matter for an opposition candidate to put himself in nomination or to make his fellow-citizens acquainted with his views. He must have recourse to the mails or to placards. But as the prefect, in cases where he mistrusted that a candidate did not love the Emperor, was not delicate about interfering with the ordinary functions of the post-office, the mails afforded the non-official aspirant but a doubtful reliance. For instance, just before the election the suburbs of Grenoble, containing twenty-five thousand inhabitants, were deprived of all postal communication for a whole day and night, it having become necessary to make a vigorous attack upon the opposition candidate at a time when it would be impossible for him to defend himself. Placards were hardly more available than circulars. To begin with, the bill-sticker in France is a Government official, and of course it would require more than ordinary courage and greatness of mind in an official dependent upon the authorities to post the *affiche* of the independent candidate side by side with that of the candidate who loved the Empire. "Both in 1859 and 1863 it happened that candidates were reduced to the actual necessity of arming themselves with pincers and paste-pot and putting up their own placards." In the latter year, one gentleman, a candidate in Bouches-du-Rhône, in company with some faithful adherents, spent the greater part of a night sticking up posters with his own hands. In the morning he had the pleasure of finding every one of his bills covered with Imperial placards. Another gentleman, chafing under a similar misfortune, was going to prosecute, under the statute against mutilating or otherwise defacing posters, but his zeal abated when he learned that there was indeed a statute providing for the punishment of persons mutilating posters, but that all complaints for its violation must be made by the administration. Another method was open to the candidate. If he could find a printer who was free from fear of the prefect on the one hand or of the bishop on the other, and could get his circulars printed, he might employ in their distribution the personal services of his friends and relatives. But the service required the passive fortitude of a martyr and the active energies of a hero: "The distributors were constantly assailed by the jeers and threats, and sometimes even by the blows, of the officials. Commissioners, mayors, gendarmes, *gardes champêtres*, and *gardes des cantonnières* beset them at all points," and occasionally put them into jail until after the election.

Meantime, the Government candidate had everything made easy to him. His posters everywhere decorated the streets. The mails did him faithful service. He could use the telegraph to his heart's content, whereas his opponent never dreamed of trying to send a despatch. The journals which made life a burden to the wife and family of the independent candidate, overflowed with praises of his competitor. The tongue of slander, which wagged unceasingly against the opposition man, was compelled to silence in regard to the Imperialist. If any elector "originated or circulated any report injurious to the official candidate," he was at once arrested, and in vain did the non-official candidate offer bail for him; he was kept close until after the election, or, if set at liberty, was warned not to reappear in that district until after the result of the voting had been made known. When the day of polling arrived, the Imperialist candidate's good fortune underwent no diminution. The mayor perhaps announced to the citizens that, no matter how many votes they cast for the enemy of the administration, that gentleman should nevertheless on no account be returned. Perhaps the "sealed urn" for the reception of the ballots was M. le Maire's pocket, held open for that purpose by a clerk. And that ballots of the right kind should alone get into the urn, it was customary to make the voter, on his way to the ballot-box, pass through a double line of military and civil officials, who narrowly scrutinized his ballot, and, if necessary, substituted the genuine official document for a non-official, and, furthermore, perhaps buffeted him or sneered at him with ferocity. To all this add that about seven times in fourteen the

gentleman depositing the ballot was entirely ignorant of the arts of reading and writing, and that his fund of political knowledge mainly consisted of the belief that the Emperor was good enough to pay the taxes out of his own pocket, and habitually did so. And perhaps, when we have added this, we may be inclined to a conclusion that Professor Adams, in describing Napoleon's method of securing favorable plébiscites, has only pushed one step further back the question whether France was not his accomplice as much as his victim. What government is it that is to represent this people which does not read or write, and which recruits the army of office-holders and soldiers which is used to keep it quiet?

Mr. John Fiske's article, "The Progress from Brute to Man," is a detached chapter of an unpublished book, but it may be intelligently read as it stands. There is a good deal in it—nothing less, for one thing, than an elaborate theory of morals, and an underlying theory, new in some important features, of the genesis of sociality itself. It is very ingenious and plausible, and is set forth with a clearness of statement and argued with a cogency which make it quite a model of its kind. It will, we dare say, surprise and gratify such readers as look to science for a shock to their religious sentiments, and too often do not look in vain. Of another earmark of contemporary science—an arrogance of tone which sometimes may be wholly unconscious of itself, but sometimes is by no means unconscious—the article is not altogether free. For example, Mr. Fiske sets out with the remark that he is unavoidably compelled to make reference to other chapters, as yet unpublished, of the work to which the "Progress from Brute to Man" belongs, but that this will probably make but little difference to the reader: "for he who already understands and accepts the Development Theory will have no difficulty in following the argument; while to him who neither understands nor accepts the Development Theory the argument will have no significance or value whatever." Here, it will be seen, the ground is entirely cut from under the feet of several classes of unfortunates—as, for example, the reader who understanding may yet reject the Development Theory; and the reader who, understanding it, may hold it in provisional acceptance only; and the reader who appreciates the value and significance of Mr. Fiske's admirable arguments and illustrations, but does not yet go the length of regarding the Development Theory as an absolute base of certitude. A remark of this kind is not a great matter perhaps; but, if no more, it is polemically ill-judged. It is a piece of controversial maladroitness, like that of saying, as Mr. Fiske said the other day in controverting some of Mr. Agassiz's opinions, that he himself, for his part, had become thoroughly convinced of the soundness of the Development Theory "thirteen years ago," when Mr. Fiske, still fortunately a young man, may have been eighteen or twenty years old. Correct opinions on important matters are formed and held at earlier ages than eighteen or twenty; but in controversy the fact is usually suppressed that it was at eighteen or twenty that one reached given philosophical conclusions as to the true solutions of the most baffling problems. But these are small blemishes in an excellent piece of work which will receive and well repay attention.

Besides these articles the *North American Review* contains also a paper entitled "The Meaning and Causes of Value," by Mr. Albert S. Bolles; another with the title of "Our Electoral Machinery," by an anonymous writer, who shows a great deal of a sort of middle-aged good sense; another by Mr. J. T. Bixby, reviewing Taine's "On Intelligence"; another on Miss Stephen's "Service of the Poor"; and, finally, half a dozen critical notices of books. Of these latter the longest are of Cherbuliez's 'Meta Holdenis' and Mr. Furness's 'Variorum Macbeth,' which is praised with warmth by a writer evidently at home with his subject. As regards the other essays which we have mentioned, very little occurs to us to remark of any one of them. Mr. Bolles's is a short lesson in rudimentary political economy, and usefully insists on the need of clear definitions; and "Our Electoral Machinery" discusses the proposed change in the electoral colleges, and is a mine of facts and arguments which will be worth having when Senator Morton's Committee reports next winter.

RECENT NOVELS.*

MISS YONGE'S 'Pillars of the House' is a novel which will get its warmest welcome in leisurely parsonage houses in England and this country; or perhaps in leisurely houses where clergymen are in even higher consideration than they are beneath their own roofs. Leisurely the houses will have to be, for the two solid volumes of the book contain no less than twelve hundred octavo pages—twelve hundred and twenty, to be exact—and some of them are not exciting at all. The story is of the struggling family of a Church of England curate. He is a scholar, a gentleman by birth, and a man of all the virtues, including the clerical leporine virtue of becoming the possessor of offspring to the number of thirteen in the space of sixteen years, at the end of which time he dies of pulmonary consumption, and leaves his widow and children nearly destitute. They are not only almost destitute of money; they are whelmed in a flood of appalling calamity. On the day of the father's death the mother gives birth to twin children, one of whom turns out to be blind, and both of whom the father baptizes at his bedside in a heartrending scene; the mother has just previously fallen down some steps, and so injured herself that she becomes imbecile in mind, and not long after dies; the eldest son, who is but sixteen, and who is henceforth the head of the house, nearly breaks his own heart and the hearts of some of his more frivolous relatives and friends by taking up the trade of a printer instead of remaining a gentleman and becoming a clergyman; the eldest daughter, who must act as the mother of the other dozen, is but fifteen years of age, and nearly overborne by her anxieties; one of the other daughters is a cripple, and grows by-and-by to be hysterical; several of the younger boys develop a good degree of genuine British brutality, which makes them a heavy handful for their eldest brother, who with difficulty restrains himself from "licking" Master Fulbert two or three times a day; a young American, a Master Travis, whom a grievous accident throws into the house, proves at first to be a very bad fellow, who vulgarly calls Lance a "little coon," and teaches Fulbert to shake the dice, which, *more Americano*, Master Travis carries about in his pocket; quarter-day often finds the young housekeepers with only sevenpence or thereabouts on the favorable side of the balance-sheet, while at the same time Lance wants shoes and Geraldine some carriage-riding. Altogether few families since the days of the house of Atreus can have been "down on their luck," as Felix would say, or more nearly "gone coons," as the slangy young Travis would say, than Felix, Wilmet, Alda, Edgar, Geraldine, Clement, Fulbert, Lancelot, Robina, Angela, Bernard, Stella Eudora, and Theodore Benjamin Underwood. They all come out of their troubles, however, Travis included, and emerge into prosperity and peace. We may, as well as in any other way, give a notion of the contents of the book by quoting a passage which describes the baptism of this same Travis, who has not been brought to that point in his Christian duty until after hard work on his own part and that of others, nor without some dangerous and almost fatal backslidings. On this side of the water he had enjoyed few religious privileges, his father worshipping money, despising the Old Country and its religion, teaching his son also to despise both, "guessing" and "calculating," and in general behaving in all respects like a vulgar materialist, as he is. The son is, to be sure, a rather queer sort of "Yankee." His mother was the daughter of a Mexican woman (with Aztec blood in her veins), who had married an English atheist; and his father is the son of an emigrated English attorney of no good repute, who came upon her in Mexico. But, whatever his nativity, Fernando's life in Mexico and Texas has familiarized him with the worst variety of Southern slaveholding life, and all this, together with his inherited Aztec tendency to play games of chance, make of him a very doubtful subject indeed. He burns down a hotel, for instance, thus causing the death of three persons; he dislikes study; he is sceptical, and so on. Still, under the teaching of Felix, Lance, and Mr. Audley, he becomes a Christian by a process which Miss Yonge does not pursue in detail, she being stronger in church decoration and Christian feeling than in theology, and he is thus baptized:

"He had not in the least realized the effect of the interior of a church. St. Oswald's was a very grand old building, with a deep chancel a good deal raised, seen along a vista of heavy columns and arched vaults, lighted from the clerestory, and with a magnificent chancel-arch. The season was Lent, and the coloring of the decorations was therefore grave, but all the richer, and the light coming strongly in from the west window, immediately over the children's heads, made the contrast of the bright sunlight and of the soft depths of mystery more striking, and to an eye to which everything ecclesiastical was absolutely new, the effect was almost overwhelming. That solemnity and sanctity of long centuries, the peaceful hush, the grave beauty and grandeur, almost made him afraid to breathe, and Cherry sat by his side with her expressive face composed into the serious but happy look that accorded with the whole scene. . . . Then came the low swell of the organ, another new sensation to one who had only heard opera music; then the approaching sound of the voices. Geraldine gave him the book open at the processional psalm, and the white-clad choir passed by, one of the first pair of choristers being Lance, singing with all his might, and that merry monkey-face full of a child's beautiful happy reverence. And again

could be recognized Felix, Mr. Audley, Mr. Bevan, all whom the poor sick stranger had come to love best, all to his present perception glorified and beautiful. They had told him it would be all faith and no sight, but he seemed to find himself absolutely within that brighter, better sphere to which they belonged, to see them walking in it in their white robes, to hear their songs of praise, and to know whence came that atmosphere that they carried about with them, and that he had felt when it was a riddle to him."

Evidently this is a story which has several of the elements necessary for pleasing and edifying a great number of persons. We may remark that some American readers will perhaps object to seeing in the hands of their young people a book in which the distinction between the "cad" and his fellow-citizens of other varieties is drawn with so great sharpness, and in which "trade" causes so much anguish to some of the personages. But we should say that the class of people which the author had in view will think that the good qualities of the story far more than balance its bad. The boys are, on the whole, manly boys, the girls womanly girls; both in the boys and the girls there is no small spice of humanity; there is ritualism to the extent of a Sister Constance—Lady Mary Somerville that was—who goes out nursing, but it is not obtrusive; there is, for the younger readers, fractiousness made odious, and good behavior made honorable; and for the elder there is a certain quantity of love-making; there are piety and pious observances, as ordered by the Church of England; and, as we have said, we may pronounce 'The Pillars of the House' a book for which many parents and children of the Episcopalian communion will be grateful.

An exceedingly interesting novel is 'The Wooing O't,' a recent addition to the Leisure Hour Series. It tells the story of a young girl who, at the beginning of the story, is living with her uncle and aunt, but who leaves them to take the place of companion to a woman who has been boarding with them. In this new position she sees more of the world, she is fallen in love with, and finally, when her protector marries, she finds another opening with a rich and eccentric young woman, and so the story runs on to its happy ending. Its plot is very slight, and certainly is far from being the main merit of the novel; that lies rather in the delicacy of the humor, the careful and accurate drawing of the different characters, and the general innocent and unaffected style of narration. The way in which the vulgar, good-natured Mrs. Berry is described is worthy of comparison with Miss Austen's best work. Her kindness to Maggie from the first, her constant amiability, her petty economies, her unfailing vulgarity, are admirably drawn; whenever she speaks it is easy to catch her peculiarities, but these are never caricatured, never turned to ridicule. Then John, Maggie's rough but kind-hearted cousin, with his noisy ways and indescribable conceit, is drawn with quite as much skill. Especially good is the description of the scene between him and Miss Grantham, where the reader has to give his sympathy to Maggie, who is listening to them both with great dread, lest John, the irrepressible, should blurt out some alarming speech. Then, too, Lord Torchester, and his evangelically-disposed mother, are admirably described. In short, this novel deserves very warm commendation for the perfect healthiness of its tone, for the keen and good-natured observation which it shows, and the sensible sympathy the writer bestows on all her characters. It is so good in many ways that the reader who puts it down may be perfectly satisfied with it, and yet not know how clever it is, but if it be compared with the numberless other attempts at doing the same thing, the difference becomes clear enough. There are but few novels of this kind which deserve a higher place than this, and it ought to go on the same shelf with Mrs. Oliphant's 'Miss Marjoribanks,' Mrs. Gaskell's 'North and South,' and, possibly, Miss Thackeray's stories.

Another good novel is 'Penruddock,' by Hamilton Aïdé, whose earlier stories gave proof of considerable ability. This one is written as an autobiography, a form of which the author is rather fond, and sets before us the youth and early manhood of an Englishman who, for certain reasons which are duly given, leaves his home and makes the best way he can in the great world. He is an honest, simple-hearted young fellow, a favorite with all except his own relatives, but his enthusiasm and over-confidence in others as well as in himself are continually getting him into hot water. All his deeds, the most innocent as well as those which are rather dubious, are harshly judged, the ears of the girl he loves are filled with calumnies about him, and his life is by no means an easy one. A German lady, the Baroness D'Arnheim, who is ten or a dozen years older than he, is a kind friend and counsellor to him, but this fact is not ignored by a censorious world, and very little good comes of it. In her character we cannot help thinking that the author has failed, but, on the whole, he has succeeded in writing a very readable novel, which we trust gives an exaggerated representation of the improprieties of London society.

Our praise of 'Miriam Monfort' must be cooler. The opening scenes are in Philadelphia, in a "gloomy-looking gray stone edifice, with massive granite steps (imported at great cost, before the beautiful white-marble quarries had been developed which abound in the vicinity of, and characterize the dwellings of, that rare and perfect city)." The heroine is unlike most other heroines in being cataleptic; she is like them in being on board of a ship that is burned at sea; and as a part of the persecutions to which we are all so liable, she is unjustly confined in a private mad-house. The further complications we can leave the reader to unravel. A few lines will show the sort of book it is:

"In the gray of a foggy February morning the duel was fought, and Captain Wentworth fell, as it was at first thought, mortally wounded.

"At the request of his excellent physician, Dr. Durand, when the watchers were exhausted and vigilance was all-essential in his case, I accepted, rather than proposed to take, the part of watcher for one night, in company with my devoted friend and coadjutor, Edward Vernon, and discovered in my anguish, and in my power over his distracted senses, my so-far hidden gift of magnetism.

"Insomnolency was destroying him; opiates had been tried in vain to compose him; and now, under my waving fingers and straining will, he slept the sweet, refreshing, magnetic slumber. He lived, some were pleased to say, and among others his physician, through my agency—my admirable nursing—for none, save Vernon, ever knew the secret of my sway. We became engaged during his convalescence, simply, quietly, unostentatiously."

But this is mild compared with some other passages, especially those in which Southerners, and especially Southerners in love, get talking.

A novel which contains a great deal of cleverness rather than a clever novel is 'Quixstar.' It gives an account of many of the inhabitants of a little Scotch village, describing every one with intelligence and humor. The writer is a very sharp-eyed person, who manages to see into the secret hearts of many characters, and who puts them before us very clearly. The story is very simple, even, it might seem, disproportionately so to the thoroughness with which the people are described, and there is something cloying in the continual flow of epigram, and something disappointing in the way in which what would, in more skilful hands, be the material of many novels, is lost sight of by the author.

Dr. Holland's 'Arthur Bonnicastle' reminds one of a dilution of Mr. George MacDonald's novels. It is a story told autobiographically, and beginning with the hero's earliest recollections. His father was a shiftless, unsuccessful New Hampshire farmer, who, under stress of poverty, takes himself and family to the town of Bradford, where he is employed as carpenter. Arthur, the hero, is then a little boy of ten, and by his guileless talk, which to the profane would seem, to use the mildest phrase, priggish if it were not so unintentionally blasphemous, he fascinates a wealthy lady living in the town. She adopts him, and Arthur enjoys to the full his new position. He is sent to a model school where the teacher is "only the biggest and best boy, and the accepted president of the establishment," where all the responsibility is thrown upon the boys. After leaving this school, and while studying at home, there is a revival in the village, and Arthur is affected by it. This does its work toward making him insufferable: he reproves his elders, he becomes a well-known speaker in the cause of religion; but soon he becomes a backslider, and enters college. There his wealth exposes him to temptation in the shape of a visit to New York. He spends the Christmas vacation there, he drinks wine, and on New Year's Day he oversteps the bounds of sobriety. But repentance follows swift, and he never repeats his fault. In time, a very thin veil of concealment is taken down, and it turns out that the real heir to all the wealth which Arthur had supposed would be his is his best friend Henry, who had fallen in love with Arthur's sister Claire. Arthur declines an invitation to go to Europe, tells Henry of the change his discovery makes in the plans of both, and studies law. Finally, of course, he marries the choice of his heart. What the novel undertakes to show is, apparently, the injurious effects of wealth and self-indulgence on the young. Arthur is always uneasy about his position and half-ashamed of the inferior social position of his father, the carpenter, but when he finds he is to be poor he sets to work and earns a livelihood. But the dangers of the wealthy are not undue prominence in revivals, and poor Arthur's little frigid temptations are hardly more than the outbreaking of his petty, priggish nature. He is the most colorless hero ever known. In fact, the whole book, while written with the best intentions in the world, is too pallid, too lifeless to deserve praise.

To such of us as bemoan the present, and look forward to the time when the world will be free of its faults and cruelties, we would commend 'By-and-By: an Historical Romance of the Future.' The author undertakes to foretell the condition of the world some centuries hence, "when our own country, at least, shall have made such advance in the solution of the problems which harass the present, and shall be so far relieved from all disabling artifices, social, political, and religious, that individuals will be able, without penalty or reproach, to fashion their lives according to their own preferences, the sole external limitation being that imposed by the law of equal liberty for all." Reformers will find that some impor-

tant changes are to be made; for instance, marriage, as we understand it, will soon cease to exist, and it will be replaced by what are amusingly called three classes of marriage, which it is not necessary to explain here. The result will be that "to have already proved her qualifications as a tender and judicious mother came to be regarded by men of sense as a woman's strongest recommendation for marriage; and the question they asked was not, 'Is she already a mother?' but 'What sort of a mother is she?'" And yet, by a singular contradiction, the ballot will still be denied women, who will nevertheless long for it, but who may expect, even in that wise future, no better treatment than Miss Anthony received last summer when she tried to vote. So at least we judge from the following extract:

"Down here with us, should a woman approach the polls, the official, being a male, and constituting himself a judge of dress and fashion, as well as of nomenclature, would say, 'By the character of your dress, or the termination of your name, I adjudge you to be a woman. You must therefore retire. The privilege of voting is not accorded to those who are thus attired or styled."

This would seem to imply the success of the Woodhull wing of reformers. The worst thing about the future, if we may take 'By-and-By' for a fair sample, will be its novels.

We are late in speaking of Mrs. Oliphant's 'May,' but those who have been disappointed by her 'Innocent' can be recommended to turn back to the earlier novel. This lady has certainly a remarkable gift for story-telling, and, whenever she succeeds, she is remarkable for her agreeable humor, her intelligent, if not over-subtle, observation, and her wise sympathy with what is good in the world. She never preaches sermons directly to us, but every one of her novels leaves a strong impression on the reader's mind of the kindliness of her heart, and that life is not so hopeless a thing after all as some novelists make out. In this novel, she has caught admirably the prominent traits of a foolish woman in Matilda, and she draws a most amusing but perfectly unmalicious picture of the way in which she fascinates a man who is in other respects sensible. Then, too, the good-for-nothing Fanshawe is well described. In fact, both of these characters are rather better drawn than the heroine. This is not a novel to disturb one's sleep, but it is, to our thinking, a successful story, which is well suited to give its readers a considerable amount of innocent pleasure.

A melancholy, somewhat morbid story is 'Hester Morley's Promise,' by Hesba Stretton. An analysis of the plot would sound like that of a sensational novel brought into the service of morality and right-doing. It gives an account of the penitential suffering of a man who begins life by running away with his neighbor's wife, and who is punished years afterwards by falling in love in vain with her step-daughter. This is not an attractive subject, and the book is filled with deep gloom; but in spite of working with such depressing material, Miss Stretton is skilful enough to deserve commendation for her descriptions of dull village life and the narrow-mindedness of bigots. The whole tone of the book, as we have said, is morbid; but there are many novel-readers who prefer morbidness.

The moral idea of Mr. Charles Reade's new novel, 'A Simpleton,' which would be very pretty if it were not very absurd, is the development of a girl's character into that of a woman through adversity. Rosa Lusignan, bred up to luxury and extravagance, marries Dr. Christopher Staines, brought up to poverty and hard work, after an agonizing prelude, during which she falls ill of a hemorrhage, owing to tight stays, and indirectly to the qualified dismissal of Dr. Staines by her father. Dr. Staines cures without any recourse to the materia medica, and then marries his patient. During the engagement, however, she had innocently flirted with one Reginald Falcon, a good-for-nothing gentleman with large debts, himself engaged to a good girl of poor but honest parentage, whom he ruthlessly tortures (when he is not borrowing money of her) by his attentions to other women. Rosa of course rejects, and thereby mortally wounds the vanity of this young gentleman, and he vows vengeance. Incredible adventures ensue. The Staines establishment is very expensive, and Mrs. Staines's efforts at economy, though magnificent in intention, are not successful in practice. Indeed, she spends every farthing they have and a good deal more, and the doctor is obliged to accept an offer as travelling physician to a young nobleman, Tadcaster by name, who must be taken a long sea-voyage. The moment of parting is terrible, and Rosa is left behind to cherish the memory of her husband, and become, by the natural development of her charming character, a matron of an unusually delightful sort. Meantime, the doctor is lost overboard, and saves himself by clinging to a raft. The crew of the raft consists of a corpse with a belt full of diamonds. The doctor goes mad, is picked up, and carried ashore still mad. He is placed in an asylum, and after a time is recognized by Mrs. Reginald Falcon, the good girl referred to before having married Reginald and obliged him, much against his will, to go with her to South Africa, where she with her brother carries on an extensive farm, and coddles her worthless husband, whom, notwithstanding his vices, she devotedly loves. This brother is the same brother whose life Dr. Staines had saved on a memorable occasion in England. Christopher gradually recovers his wits, and he and Reginald Falcon do some very adventurous diamond-digging and travelling together; but the wicked Falcon, as soon as he gets hold of some money, deserts the African party altogether, and hurries to England, where he indulges in needless villany, and comes very near marrying Rosa, under pretence that her husband is dead, nothing of course being known of the existence of his own wife. It all ends happily however, leaving Rosa and the Doctor in each other's arms, and Falcon howling—to use a favorite word of the author's—outside the window, through which he has just been pitched. To any one who knows Mr. Reade's other books, there is nothing in this story, because it merely contains a number of his old characters, who are made to go through new adventures. There is a strong resemblance between Rosa and the heroine of 'Love Me Little, Love Me Long,' Dr. Staines is a later medical and scientific equivalent of Mr. Eden, the wife of Reginald Falcon is remarkably like the girl who figures in 'Put Yourself in His Place,' and we even catch a glimpse of our old friend Jacky the savage once more. We confess to a liking for much that Mr. Reade has written; the chief difficulty with his later stories like this 'Simpleton' and the 'Wandering Heir' is that there is a little too much pathos and adventure to the square inch.

MACMILLAN & CO., 38 *Bleecker Street, New York.*

THE WEEK IN TRADE AND FINANCE.

OCTOBER 20, 1873.

WE have no change to report in the situation of affairs since last week. On Monday the National Trust Company resumed business, and thus far the demands upon the institution have been less than was anticipated by the officers of the Company. We hear nothing with regard to the efforts of the Union Trust Company to resume, further than that it is understood to be the intention to reopen for business at an early day, with an enlarged capital of $1,000,000, making the new capital $2,000,000. A meeting will be held to-day, when the matter will probably be decided.

Reports from the interior indicate that in all the Western cities there is an unusually large amount of currency in the different banks and moneyed institutions. This is especially true with regard to Chicago and Cincinnati. In this city legal tenders and National bank currency continue to command a premium of from ¼ to ½ per cent. over certified checks. The savings-banks have released none of the currency so effectually locked up by them some weeks since. The thirty days' notice which the savings-banks required from their depositors before paying over deposits, will expire this week; and it is probable that in case the demands from their depositors should be light and the banks should have no further use for their hoardings, the latter may decide to put the currency again in circulation through a repurchase of their Government bonds, which they can do at lower prices than those at which they were sold.

One of the most serious drawbacks felt during the past week was the difficulty of getting remittances from Boston, Philadelphia, and other cities. The New York banks are obliged to refuse taking and crediting up drafts or checks on other points, as the out-of-town banks have notified them of the impossibility of their making any returns whatever for the present. In Boston, ½ per cent. premium was paid during the week for New York funds, while in Philadelphia the premium was still higher.

Money has been rather easier with the brokers, who have been able to supply their wants by borrowing from one another at 7 per cent. per annum to ⅛ per cent. per diem. The ruling rate, if we may so call it, was from $\frac{1}{32}$ to $\frac{1}{16}$ and interest.

The Bank of England rate of discount was raised on Tuesday from 5 per cent., at which it had been standing, to 6 per cent., and on Saturday, at a special meeting of the directors, the rate was further advanced, and now stands at 7 per cent. This action of the Bank was, of course, taken for the purpose of preventing further shipments of gold to this country. Advices from London state that the advance in the discount rate was not unexpected, and no stringency in the market has followed thus far in consequence.

On Monday the stock market opened very weak, and continued so, with a sharp decline in prices, until Wednesday, which carried down New York Central to 82, Lake Shore to 57½, Harlem to 100, Rock Island to 81, Wabash to 32¾, Western Union to 45, and Pacific Mail to 25. In the afternoon prices recovered rapidly, Lake Shore rising 10 per cent., New York Central 7 per cent., Western Union 9 per cent., Rock Island 6½ per cent., and Harlem 6½ per cent., other stocks sharing in the improvement. The market since Wednesday has continued to improve, with a good demand for stocks from outside parties, who of course buy for cash and take the securities away with them.

The half-yearly dividend on New York Central was promptly paid on the day on which it was due at the office of Messrs. Duncan, Sherman & Co.

The following shows the highest and lowest sales of the leading stocks at the Stock Exchange for the week ending October 18:

	Monday.		Tuesday.		Wed'day.		Thursday		Friday.		Saturday		Sales.
N. Y. C & H. R...	88¼	91	82½	88½	82	87¼	86½	90	88¼	90¾	88	89¼	95,800

SAMUEL S. STEVENS, Agent.

SPECIAL NOTICES.

TERMS: In advance, one insertion, four cents per word; five insertions, three cents per word, each. The enclosure of a stamped and addressed envelope will secure a numbered box, to which communications may be addressed.

A LADY, fully competent, desires a position as Housekeeper or Companion to an Invalid. Willing in either case to assist with sewing. Can cut and make children's clothes, also ladies' dresses. Best references given. Address stating terms, Miss H. E. C., Box 27, *Nation* Office, 5 Beekman Street, N. Y.

ART INSTRUCTION. Miss Helen M. Knowlton's Class in Drawing and Painting from Objects and from Life will reopen on Saturday, November 1, for a term of five months. Studio, 154 Tremont Street, Boston. Reference, Mr. WILLIAM M. HUNT.

A LADY, Experienced and Capable, wishes a position for which a few hours' instruction each day would be considered an equivalent for board. Best references given and required. Address, appointing interview, M. C., Station H, City.

A CLASS for Young Gentlemen will be resumed September 15, by THOS. R. ASH, No. 17 East Sixteenth Street. Apply from 10 to 12 M. Circulars sent on application.

WANTED—by an experienced writer for the press, well versed in art and literary criticism and foreign politics, a position on a leading newspaper. Address W. J. STILLMAN, under cover to the editor of the *Nation*.

CHICAGO.—Thorough Preparation for College or the Scientific Schools. EDW. STANLEY WATERS, A.M., 15 Congress Street.

DE VEAUX COLLEGE, Suspension Bridge, N. Y., near Niagara Falls. Church School for Boys. Cadet organizations. Registers with full details.

SPECIAL NOTICES.

TO PARENTS who desire a teacher to begin and carry on the education of their children.—Believing that the greatest success in teaching is only attainable when there is much congeniality between parents and teachers, the advertiser is on the outlook for a suitable position—a position promising a suitable permanency, and at the same time securing on each side the spontaneity necessary to render any engagement pleasant. The enquirer is devoted to her profession, and would like to be where she could be surrounded by the results of her labor and the gatherings of years. She prefers the country for the study of nature, but desires to be within easy reach of a large city. The positions which the advertiser has filled during a residence of sixteen years in this country are guarantees of her capacity. Address, during this year, TEACHER, box 58, *Nation* Office.

MRS. WM. G. BRYAN'S Boarding-School for Young Ladies. The Fall Term of Mrs. Bryan's School commences September 17, 1873. Batavia, N. Y., June 7, 1873.

ADAMS ACADEMY, Quincy, Mass. William Reynolds Dimmock, LL.D., Master. Applications for admission may now be made for the next school year. A large Boarding-house will be opened in connection with the Academy, under the direction of the Master, who will reside in it. A class preparatory to the Academy, and under the direction and superintendence of the Master, will also be formed of a limited number of boys. For circulars with full particulars, address the Master.

CAZENOVIA SEMINARY. Established in 1825. Has prepared over 600 young men for College. Address W. S. SMYTH, Cazenovia, N. Y.

The Nation.

NEW YORK, THURSDAY, OCTOBER 30, 1873.

The Week.

THERE was a little financial flurry in the beginning of the week, caused by a letter which the President wrote to Mr. Williams of the Metropolitan Bank, and of which Mr. Anthony supposed himself to have received a gloss or explanation in a conversation with the President himself. This explanation was sufficiently astounding, as it made the President urge the banks to do their utmost to relieve the money stringency, and declare that the Government would help them "by issuing three or four millions a week of the reserve." Secretary Richardson, on being questioned on the subject, denied all knowledge of any such plan, as did General Babcock, the Private Secretary, and there was for a moment a horrible fear that the President was going to inflate the currency himself of his own motion, and that Mr. Richardson would resign in a huff. It turned out, however, that the President's letter contained nothing but a commonplace expression of good-will, and the conversation with Mr. Anthony degenerated into a mysterious "conflict of veracity," which will probably never be cleared up. The right to issue the "reserve," however, in spite of the law, continues to be maintained and asserted, but has been transferred in theory from the Secretary to the President. The *Financial Chronicle* devotes a good deal of space to the reproduction of the argument which appeared in these columns a year ago, showing that the issue is utterly illegal, and points out that every time it takes place it defrauds the actual holders of outstanding greenbacks by lowering their value. No arguments, however, will do any good as long as the public is as apathetic as it is now. If public opinion were in a healthy condition, Mr. Richardson would not venture to talk and act as he does about the "reserve," especially after his pretence of reverence for the law in his interview with the bankers at the Fifth Avenue Hotel at the end of September. Had he then been as unscrupulous as he now cheerfully confesses himself, he might have stayed the panic. The mischief being done, he throws off the mask, and practises on the public patience.

Mr. Richardson let it be known early in the week that the price of silver was so low that the Treasury would at once resume specie payments in that metal, and that anybody who chose to draw it for greenbacks might have as much of it as he needed. It appears that, when he came to this determination, he had less than half a million of silver on hand; and, as soon as it got abroad, he was assailed with so many demands for the coin from all parts of the country, that he saw that his stock would be exhausted in a few days. He has accordingly given up his scheme. When one comes to examine it, however, it is well calculated, like some of General Grant's financial ideas, to excite alarm, owing to the fresh revelations it affords regarding the attitude of those who manage the national finances towards the laws of trade. Any banker down-town would have told him that, owing to the low valuation put on silver by our Government as compared to gold, gold will have to fall below 105 before silver will stay in the country any longer than gold. At present prices it is profitable to export it; and consequently, no matter how much be issued, it would not stay in circulation. Mr. Richardson, by way of accounting for his failure, says "the agitation which had occurred in consequence of the announcement of the intention of the Treasury to place the currency on a silver basis had defeated the object he had in view"; and that if this intention "had not become public nor been discussed by the public press, the silver on hand would have been sufficient for the purpose," etc. From this it would appear that what he is aiming at is *secret* resumption, which will be something new in the history of finance. He means to resume when nobody is looking.

As the day of election approaches, the air in New York becomes thick with startling news. The organization known as Apollo Hall, which was composed in equal numbers of gentlemen who wished to "sell out" to Tammany, and gentlemen who would on no account sell out to Tammany for the very good reason that they desired to sell out to Tom Murphy, has effected an arrangement with the Custom-house, securing a share of offices on the Republican ticket. On the other hand, the "dead-lock," as it is called, between the Mayor and the Aldermen on the subject of the police justices, has come to an end by means of a compromise, and the justices have been actually confirmed for long terms. The new judges are, on the whole, a great deal better than the old ones. Only one justice is retained in his place, and he, curiously enough, is said to be an "Apollo Hall man." The judiciary nominations are generally good on both sides, though there are one or two men who are in bad odor. The Bar Association has issued an address on the subject of the judiciary amendment, which brings out the astonishing fact that, since 1846, while there have been in Massachusetts only 18 Supreme Court judges or judicial terms, in the two highest courts in this State the machine has been kept in such rapid revolution that we have turned out 280.

The address ought to prove a strong appeal. Our own opinion on this subject has been often reiterated, but as this is very likely the last time in the lifetime of the present generation that the question will be presented to them, we take this opportunity of saying that in our opinion the continued safety of property and person in New York, and not merely in New York, but throughout the United States, depends very largely on the adoption of this amendment. Appeals are being continually made to people to "clinch the great reform movement of two years ago by rising in their might" and electing this or that assemblyman, sheriff, or coroner. But every one knows that the effect produced in this way is a mere trifle compared with that which would follow from securing a bench throughout the State upon which we could really rely. The vote on this question will be determined, if it is determined in the affirmative, by the action of a class of persons who ordinarily stay away from the polls, and we earnestly advise our readers in the State and city that it is their solemn duty to vote for the overthrow of a system which, to use the language of Mr. Evarts, has lowered the dignity of the bench, weakened the force of law, impaired public confidence in the administration of justice, made criminals more numerous and bold, and life and property and character less and less safe for thirty years.

The New York *Times* has recently dwelt on the importance of the approaching election as regards the management of the State canals, and has urged people to support the Republican candidates as the great means of keeping this management pure. General Barlow, the present Attorney-General, has during the past two years been very busy with investigations of canal affairs, and has unearthed a great deal of fraud and jobbery. When, therefore, he heard that the Republican Convention proposed the other day to nominate Mr. William B. Taylor for State Engineer, he wrote a letter, to which we have referred once before, and which we have seen, calling the attention of the managers to the fact that there had not been a job or swindle in the Canal Board for the last two years for which Taylor had not voted, and that he had steadily supported every scheme of the canal ring. This information was conveyed directly to all the leaders, including the eloquent Conkling, the patriotic Murphy, and the energetic Sharpe and Laflin. The result was that Taylor was at once nominated for State Engineer and Barlow was dropped, and all the "organs" have kept dead silence about the letter. There is something comical, yet melancholy, about the whole performance, coming at the close of a reform movement, and illustrates for the hundredth time the confidence with which the professional politician relies on the working of the

party machinery, or, in other words, on the blind following of the public.

We beg to call Mr. D. B. Eaton's attention to the circular issued by Mr. G. F. Hopper, the Superintendent of the Box Department of the New York Post-office, in which he requests the clerks of the Post-office to contribute to the party expenses at the approaching election. Mr. Hopper was cunningly appointed collector of funds or the canvass by the State Committee. The circular is a polite invitation on its face, but it is in reality (and was so regarded by the clerks) an order which they dared not disobey. In other words, they have been fined to a considerable amount. Now, what we want Mr. Eaton to observe is that, unless practices of this sort are stopped utterly, people will continue to regard the prohibition of assessments contained in the civil-service rules as a mockery, and the whole civil-service movement as a delusion and snare. He cannot expect anything else. The form in which poor clerks are levied on is of little consequence as long as the fact remains that an invitation by their superiors to pay money has the force, and we are assured the effect, of an order. We must not be told here that the reform "goes on slowly, but still it goes." This assessment abuse has been reformed on paper. All that is needed now is honest enforcement. As matters stand, the rule is a permanent fraud, which gentlemen like Mr. Eaton cannot afford to wink at. All solicitation of these poor Government employees by strolling politicians and their agents is a real, substantial violation of this rule.

An important proposal has been brought forward as a solution of the cheap transportation question which has not yet received much notice from the press. The plan is to keep the canals open all winter by means of artificial heat. It is understood that the inventor of the process has laid his plans before Senator Windom's committee, and that it will be considered and reported upon at the meeting of Congress. At first sight, it seems as if artificial heating would increase rather than lower the cost of transportation; but the argument is that it is only the heating apparatus which is expensive; the cost of transportation itself is lessened by the canals doing more business. We can see no flaw in this argument, which ought to commend itself to the farmers, for it is very much like some for which they have a great affection. All it will be necessary to do will be to keep the warming-pan construction account separate from the others.

The *Tribune* correspondent to whose letters from the West we have so often referred, is now writing from Minnesota, where there is a great deal of outcry against the roads; but he comes to the conclusion, after patient examination of the arguments on both sides, that there are no grievances at all which farmers can honestly complain of. The Minnesota law for the equalization of freight has proved, like the Illinois law, a ridiculous failure, and no one tries to enforce it. As a glaring instance of the absurdity of the law, an officer of the St. Paul and Sioux City road mentions the fact that it takes no notice whatever of the difference in cost between running a train "down a grade" and "up a grade." Between Winona and Sioux City, for instance, the regular charge is $77 85 per car-load of lumber. By the law, this rate is reduced to about $38 92½. Now, the railroad would be glad to carry grain back at the price which is fixed for carrying lumber out, for the simple reason that the grade is favorable; but, on the contrary, the law allows the road to charge more than twice as much. It is obvious that, if the road conformed to the law, the people who would be benefited would not be the farmers, but the lumbermen; and it is only necessary to add, for a full comprehension of the matter, that the committee of the Legislature which prepared the law is now suspected of having acted in the interest of the lumbermen's lobby or ring. As we said last week, this sort of capture of the farmers' movement by politicians, or lobbyists, is as inevitable as the action of the force of gravitation.

In Kansas the game is over, and loud complaints are made among those who have been honestly supporting the Grangers that "the old played-out politicians and office-seekers have pre-empted and ruined their movement." One paper asks: "How is it that such notorious corruptionists as Sid. Clarke and John Speer are allowed to run a movement which calls itself *reformatory*? The thing is a contradiction in terms. You are sold. Get out of it at once." In Chicago the farmers have been holding a great meeting, and they request, 1st, that Congress shall fix a maximum freight-and-passenger tariff between States; 2d, that the General Government shall begin the construction of more railroads and open more water-routes; 3d, they advise that "the people be urged to support home manufactures"; 4th, they adopt a resolution "urging the people to free themselves from the curse of debt"; 5th, they declare against all special legislation; and 6th, urge thorough organization against the monopolists. They also passed a few other resolutions separately, the most important of which was one advising each other to "hold back their hogs" till they could get $5 for them.

It is refreshing to turn from these proceedings to the meeting of the National Board of Trade, held at Chicago also at the same time. The Board voted down a resolution begging for bounties on American-built ships, for the reason that the American ship-building industry is reviving of itself without legislation. They also voted down another resolution calling upon Congress to allow all articles of foreign product needed for subsistence and general use, on board vessels engaged in the foreign trade, to be withdrawn from bond without payment of duty, and adopted a resolution demanding that American citizens should have the right to "purchase a ship, wherever built or owned, and to place it under the protection of their own flag, on the payment of a reasonable duty." The subject of transportation was discussed at great length; but the members of the Board, with much good sense, ended the debate by leaving the matter very much where it was before. The Board adjourned, to meet again in Baltimore in January, and on the whole we may say that they have every reason to feel satisfied with their work, both with what was done and what was left undone.

The facts with regard to ship-building in this country seem at present, to judge from the speeches made at the meeting of the Board, to be these: The cost of building ships on the Clyde is rapidly increasing, owing to the disturbed condition of labor on the other side of the water. On the other hand, in this country, the cost is rapidly being reduced. Labor is becoming cheaper and more plentiful, coal is more and more abundant. Mr. Stone, of Wilmington, Del., made a statement to this effect, saying at the same time that the ship-building interest will take care of itself, if Congress will only let it alone: "The constant rumors of Congressional tinkering with the laws, instead of helping, is a constant source of injury to the trade." Considering that we have now three iron ships costing about $550,000 each, built in America without aid from any source, it seems clear that, for the present, the more ship-building is left to itself, the better.

The correspondence between the Colonial Office and Earl Dufferin with regard to the Canadian scandal has been published. It consists of a defence of his own course in the matter. That he has had a very difficult part to play may be inferred from the following passage, taken from his despatch of the 15th of August. The Opposition had urged that on the publication of the Huntington charges he ought to have at once dismissed the Ministry. He says, however, that this would prove very difficult in practice, "for, as far as I have been able to seize the spirit of political controversy in Canada, there is scarcely an eminent man in the country on either side whose character or integrity has not been at one time or another the subject of reckless attack by his opponents and the press. Even your lordship and Mr. Gladstone have not escaped, for it has been more than insinuated that the Imperial Government

have been got at by Sir John Macdonald, and that the law officers of Her Majesty were instructed to condemn the Oaths Bill contrary to their legal convictions." The Home Government have given a guarded approval of the acts of Lord Dufferin. The Dominion Parliament has met, and a report of the proceedings of the Investigating Commission been submitted to it without recommendations.

The two events of importance in English politics during the week have been Mr. John Bright's return to public life and to the Cabinet, in which last he takes a seat, he says, because he can there the more effectually promote the causes he has at heart; and Mr. Disraeli's letter to Earl Grey, abusing the ministry in the grossest way, and thus, it is said, leading to a reaction which has caused the return of a Liberal candidate at Bath, a borough which sent up a Conservative candidate at the last election. The election took place just after the publication of the letter, to which it gave a test-character; and the result is generally taken as an indication that the Conservatives have been presuming too much on the strength of the late turn in the tide. In England as here, however, financial questions are just now the most interesting; and the Board of Trade returns for September, showing considerable contraction in trade, are exciting a good deal of attention. There has been a slight increase in the value of the imports during the month, and a decrease in the exports. The falling off in the exports has been mainly in textile fabrics and in iron and steel. The exports of iron and steel have declined in September of this year, as compared with the corresponding month of last year, from 300,508 tons to 265,793, or 13 per cent. But it is not true, as was reported here, that there has been an importation of iron into Liverpool from this country. The foundation of the story was that an English firm enquired of an American firm at what price American iron could be delivered in England, but found that an importation would not pay at the rates named.

It is very difficult to arrive at any conclusion worth offering as to the state of things in France. Within the last fortnight the chances of the Monarchists have apparently declined, but their confidence is unabated, which looks as if they were still sure of their majority in the Assembly, and this is the main point. The Bonapartists have, it is reported, at last determined on a policy, under "instructions from Chiselhurst," which is to offer at the opening of the session to vote for the re-establishment of the monarchy if the question of the dynasty is submitted to a popular vote. The Republicans, on the other hand, are very sure that the sentiment of the country is becoming increasingly hostile to the restoration—the white flag being still odious to the peasantry—and that the filling of the thirteen vacancies now existing in the Assembly will show this. They are working hard, and are to be marshalled under the leadership of Thiers in the Assembly, Gambetta having agreed to "efface himself" for this occasion. A deputation of leading royalists is now laboring with the Comte de Chambord, in order to extract from him the exact nature and extent of the concessions he will make to modern ideas. It will depend on the result of their mission, probably, whether he will be set up really to reign, or merely to make way for the Comte de Paris. The Duc de Broglie, the ablest and most enlightened man of the monarchical party, has made a speech ridiculing the notion that any restoration of clerical supremacy is possible in France, no matter who seeks it. No man or dynasty, he says, can fight against the ideas of the age and its social conditions, which is true, but then clerical supremacy is, to use one of our own phrases, a "good-enough Morgan until after the election."

There is so much wild talk in foreign journals about the conduct of the majority in the Assembly in assuming "constituent powers"—that is, in attempting to fix the form of government without consulting the nation—that it is well in the interest of "political science" to recall the fact once more that the Assembly is adhering strictly, not only to French precedents and traditions, but to those of all European countries. A reference to the people of the question of the form of government has never been made in France or anywhere else by any party, and, however low one's opinion of the French Legitimists may be, it is absurd to expect them to begin the practice, or to abuse them for not doing it. The Government of England was changed in 1688 by Parliament; the legislative independence of Ireland was surrendered in 1801 by Parliament. Every body of persons who have seized the reins of power in Paris within the last eighty years have settled for themselves the form of government, and left nothing for the Constituent Assembly to do but draft the constitution. The present Republic was set up by a mob in the street, and Gambetta treated their decision as final, and issued decrees actually prescribing the qualifications of members of the legislature which subsequently met. Louis Napoleon, in like manner, overthrew the Republic, and seated himself firmly as a dictator before he asked the people what they thought about it, and in all his plébiscites never once offered them an alternative of any kind. The fight now going on in France is, in short, a fight between the supporters of two kinds of divine right, and not between experimental politicians and feudalists.

The accounts from Spain from both sides concur in describing the Carlists' cause as declining. They have not been able to cross the Ebro, in spite of a good many successes during the summer, and their long continuance in the districts peopled by their own friends is alienating the inhabitants, who have to bear all the burdens of the war. Moreover, Castelar is sending against them all the reinforcements he can collect from whatever quarter, so that the Government troops begin at last to outnumber them in the northern provinces. The dictatorship is decidedly telling on the Republican army, owing to the dictator's abandonment of the various hallucinations in which he and his friends indulged when he was in opposition. He has not only re-established the conscription, but permits mutiny to be punished with death, and has restored the artillery officers to their old positions, it having been discovered at last that the artillery could not be commanded by right-minded sergeants and corporals. The result is that discipline begins to revive, and many officers of all arms who had resigned in disgust are returning to the service. The siege of Cartagena has been reduced to a mere blockade, but even this the place is not likely to stand very long. The insurgent fleet is roving up and down the coast, plundering merchantmen, and occasionally making requisitions on shore—a spectacle absolutely without precedent. It is, however, a curious illustration of the nature of Spanish "republicanism" that Castelar's success thus far should be ascribed to his having got rid of the Cortes. Were the legislature of the Republic sitting, it is generally acknowledged that even a dictator could not carry on the Government. In other words, the "Republic" is saved through resort to lawless monarchy.

The alarm and estrangement produced in Italy by the impending restoration in France have led to the revival of the committees for the recovery of Nice and Savoy, now for some years inactive. This movement, little as it probably represents any purpose on the part of the Government, still excites some apprehension in Paris, already disturbed by the King's journey to Berlin and Vienna. In view of it, an address to the Italian people has been drawn up by certain anti-monarchists, apparently of the Protestant body, as we find the document in the *Renaissance* of the MM. Coquerel, and signatures are solicited at the office of that paper. This appeal for continued peace and friendship points to the many good offices of France to Italy, and denies that France—"la vraie France"—has ever dreamed of contesting Italy's right to Rome as her capital. What France it was that bereft her of Nice and Savoy is not stated, nor what France is now interested in retaining the provinces acquired by that fraudulent instrument of the Second Empire, the plébiscite. The right to speak in the name of "France," indeed, is asserted at this moment by too many parties to make the assurances contained in this address very comforting to the Italians. A general show of resignation as to the loss of Alsace-Lorraine would be a more effective rejoinder to the Nice-Savoy agitation.

THE WORKINGMAN AND THE PANIC.

A VERY large number of laborers in various fields of industry are undoubtedly likely to suffer considerable loss and privation during the coming winter. Many factories have suspended work, though we hope and believe only for a short period, and others are working on short time, and there is hardly any branch of trade or manufacture in which there has not been a reduction of wages, which, unless there should be a further inflation of the currency, will in all probability be permanent. There is in some quarters a disposition to make this the occasion for taunting the workingmen by recalling the reckless and unscrupulous way in which they have used their power in strikes during the late years of prosperity, and the impediments they have thrown in the way of production by their trades-union regulations. They now see, they are told, the consequences of their folly and misconduct, and will not receive half the pity that would, had they behaved more rationally, have been bestowed on them.

It is, however, hardly fair to the workingmen to connect their past warfare against capital with the present crisis in anything like the relation of cause and effect. It is not disturbances in the labor market which have brought about the present panic, though, as in all panics, it is the laborers who suffer most from it and will suffer longest. Indeed, the disposition to throw the blame on the "sons of toil," as the reporters call them, is a curious illustration of the frequency with which popular idols are changed. Any time during the last ten years, the member of our body politic who could not do wrong, who was always industrious, sagacious, and moral, and who knew how the country ought to be governed, and who must of necessity have things his own way, was the Workingman. That he was very unreasonable in his demands, or that his ideal society was incapable of realization, or that any of his grievances were imaginary, was something that no politician, and but few newspaper writers, would admit for one moment. He was, in short, the one person in the business community to whose convenience all things had to bend—and by Workingman, of course, was meant the mechanic and common laborer; and the wise men of the Government, from the President down, have for some time past been busy contriving ways of enabling him to draw as much pay for eight hours' work as for ten. All this is now changed.

The Workingman has fallen into neglect and obscurity, and the prominent figure on the stage—the person who must not be gainsaid, whose demands must be satisfied, and against whom neither political economy nor common sense ought to prevail, is the Farmer. He it is whom "the monopolists" are now crushing, and who is diddled out of his fair share of the products of the national industry, and must get his own price for his commodities. Accordingly, we have begun to scoff at the poor Workingman, and ask him how he likes hard winters, and whether he is not sorry for his strikes and his eight-hour movements. We even insinuate that he is not much of "a son of toil" after all, and that his hands are not as "horny" as they might be.

Now, the Workingman has had no more to do with bringing about the present panic than the lawyers—in fact, not quite as much. The manufactures of the country are suffering from serious, though we believe only a brief, depression, caused in part by tremendous mistakes and misconduct in railroad-making and in railroad management, and in part by the frantic and irrational assaults of the worthy Farmer on a species of property in which about $3,000,000,000, or a sum considerably larger than the national debt, is invested. He has only to continue his assaults in the same direction, and help shake the security of this species of investment more thoroughly, and we think we can promise the good man a panic and "depression," and a difficulty "of realizing on assets," and of "getting grain down to tide-water," which will fill his life with a new and strange light. But the lessons that the Workingman has to learn from the crisis are of a different kind, though there is nothing very hard about them. That he should have looked to strikes and trades-unions for solid improvements in his condition is nothing wonderful, considering the remarkable stories he has heard from the platform and the press about the extent to which capital cheats him by appropriating the results of the increased productiveness of machinery, and of the prodigious diffusion of happiness that would result if all workshops were shut an hour or two earlier. He has been during the last twenty years the victim of a lamentable amount of delusion, produced by the preaching of well-meaning and kind-hearted philanthropists and reformers as to the possibilities of this mortal life and as to the earth's capacity as a producer. The reaction from the excessive denunciation of this world and its joys in which the church and its branches indulged down to the beginning of the present century, has perhaps not been unnatural, but it has been excessive. Fifty years ago, the Workingman was assured that his highest duty was content, and that his bitterest privations were signs of God's love, and useful preparations for the better world of which this life was but the gateway. Now he is told that discontent is a condition precedent of regeneration, and that the reason why life is hard, fare scanty, and raiment coarse, and ceaseless toil imperative, is that the rich play tricks on him. In short, he is now all but satisfied that Nature intended him to live like a gentleman, and that the earth produces what Butler calls "a competent fortune" for all, and that what prevents all from enjoying it are the defects in the dividing apparatus.

If the panic operates in any degree as a disenchanter of any body of poor men who find themselves now sent adrift at the opening of winter, or find their wages seriously reduced, and have their eyes opened by it as to the real conditions of their security and prosperity, they will have purchased their experience very cheaply. The deplorable feature in the system of paying labor by wages is undoubtedly that it makes large bodies of persons, of all ages and sexes, dependent on the providence and sagacity and honesty of one or half a dozen. If a great manager or manufacturer or financier makes a mistake or commits malfeasance in office, a thousand, or it may be ten thousand, persons are thrown out of employment at a week's notice, they do not know why and cannot find out, and, what is worst, this fate is constantly impending over them. No outward signs of prosperity offer them the slightest guarantee against it. Indeed, nearly all the great failures and resultant panics occur when the industrial world seems to be sailing on a flood-tide of successful production. Now, there is no question that this blind and helpless dependence on the conduct of others with whom one's relations are solely commercial, is one of the most weakening and corrupting agencies to which human character can be exposed. The more a man has his fate in his own hands, the more of a man he is, and the great end and aim of "labor reform," and indeed the only end and aim worth much talk, is the committal to the working-classes, as far as is possible, of the management of their own affairs. Indeed, we hardly hesitate to say that it is only through co-operation—that is, the participation of every worker in the business cares, or, at all events, in the knowledge of the business conditions and responsibilities, which surround and uphold his peculiar industry—that any real and permanent improvement in his condition is to be looked for. Saving is very well, as it is well to be prepared for inundations and plagues; but it is better still to understand what brings inundations and plagues about, or to share fully and freely in the work of preventing them, instead of sitting with folded hands and praying lips waiting for them. Of course it is easy to point out the difficulties in the way of co-operation. It is quite true that it is largely a question of character; that if we cannot have improvement of character without co-operation, it must also be said that we cannot have co-operation without improvement of character. But it must be borne in mind that the sole ground we have for believing that there is anything but ruin in store for the human race is the assumption that the character of the great mass of mankind can be bettered. If this be not true, science as well as literature and art is an idle pursuit, and the future of our civilization not worth thinking about.

We cannot turn the whole working-class into "scholars and gentlemen," but we certainly ought to be able to facilitate the crea-

tion of relations between capital and the skill of the working-class such as will give them a saving sense of the modes in which capital is created and used or wasted.

THE RAILROAD MYSTERY.

WE publish elsewhere two letters which describe what we may call the second stage in the farmers' controversy. When it opened, it was roundly asserted that the railroad companies "watered" their stock for the express purpose of furnishing an excuse for putting up their rates. A very little examination revealed the fact that this was a ridiculous charge, and that, as we showed a fortnight ago, there was no relation whatever between the amount of the debt and stock of the roads and their scale of charges. Accordingly, the agitators have now entered on what appears to be high ground, and allege that the stock has been "watered" in order to afford the companies an excuse for not lowering their rates, which they are bound to do.

It must be borne in mind that we are not defending the practice of "watering" stock. We are simply engaged in showing in what manner a controversy, seriously affecting social and economical interests of the highest importance, may be successfully carried on in our day in a commercial community by determined and brazen demagogues. This phrase "watered stock," which is used so glibly, and always used in a question-begging way, as if it was in itself an argument, in reality contributes nothing more towards a settlement than the phrase "aquatic," or "calcareous," or "ferruginous stock" would do. It has a bad sound, but the real purpose it serves is one of concealment and evasion.

The true question at issue between the farmers and the railroads is whether the latter have a right to make large profits, or are bound to confine themselves to the ordinary rate of interest. What is meant when it is said that a company is "earning dividends on watered stock," is simply that it has cut its stock up in such fashion that, instead of paying 15 per cent. on one share, it pays 7½ per cent. on two. There is nothing objectionable in the division of the stock. It is a matter which does not concern the public in the least. The real point in dispute has nothing to do with the number of shares, or the time or manner of their issue. It concerns the rate of profit solely. It is, in other words, Has there been a maximum of profit fixed either by law, or custom, or morals, and are the companies going beyond it? and the farmers' movement in this, its second stage, rests on the assumption that there does exist such a maximum, and that the companies have gone beyond it. That this assumption is baseless needs no argument to show. The railroads have all been constructed on the theory that they were private property, to be managed like other business, and on no other theory could they, in a new country in which there was such strong oppositition to Government interference, have been constructed. This may or may not have been a good way of constructing them. The fact is that capital was invested in them on this understanding, and to attempt to apply to them now a new theory, which makes them public highways, and takes them out of the category of business enterprises, without compensation to those who took the risk of making them, or who invested in them on the old theory, is, to speak plainly, to attempt a fraud, and it is a fraud which cannot be disguised by the phrase "watered stock." When "the hoarse cry of the demagogue," to use the Chicago *Tribune's* language, crosses the sea, and tells the foreign holder of American railroad shares that he cannot receive any more dividends on them, because a body of persons, called "the farmers," have decided to "take the water" out of them, he will not be in the least prevented by this term from styling the transaction a swindle, or from determining that no more of his money shall go to that quarter. And what most concerns the future of the West, let us assure the agitators, is not the rate at which it can get its grain carried, but the extent to which it can inspire the world with confidence in its honesty. Let it once satisfy people that capital is not safe in its hands, but that it is exposed to the assaults of hungry politicians, and there is an end, for the present at least, to its prosperity.

We shall now proceed to show that the second ground suggested by our correspondents, that the watering of stock has furnished an excuse for not lowering rates, is as untenable as the first, because, as a matter of fact, though stock has been steadily increasing on every road in the country since 1860, rates have been, during the same period, steadily declining, except where the actual cost of transportation has risen; and that, in general, the startling result is reached that, while the cost of rent, food, clothing, and all the necessaries of life in the United States have been rising, the charges for Western freights have been getting lower and lower every year.

The Michigan Central Railroad may well be taken as a typical Western road; typical in the enormous increase of its stock, typical as being controlled by Eastern capitalists, and typical, also, in the recent decline of its returns to stockholders—typical, as being an "East and West" road, running from Detroit to Chicago, of considerable length (nearly 300 miles, and operating half a dozen leased lines, which increase its total mileage to over 700). The history of this road for the past few years with regard to its stock and freight rates have been as follows:

Capital Stock.		Increase.	Earnings per Ton per Mile.		Decrease.
1864–65	$6,491,386		1865	.3 6/100	
1865–66	6,982,866	$491,480	1866	.2 60/100	4.6/100
1866–67	8,070,666	1,087,800	1867	.2 49/100	1.1/100
1867–68	8,477,366	406,700	1868	.2 45/100	4/100
1868–69	11,197,348	2,719,982	1869	.2 9/100	3.6/100
1869–70	13,225,848	2,028,500	1870	.1 98/100	1.1/100
1870–71	14,665,848	1,440,000	1871	.1 61/100	3.7/100
1871–72	17,500,000	2,834,152	1872	.1 56/100	5/100

In 1873, there was an increase from .1 56/100 to .1 57/100, but this is too trifling to be taken into the account.

It would seem to be obvious from this table that the directors of the Michigan Central are drivelling idiots. Here they are going on for ten years watering their stock and lowering their rates, when it has been pointed out to them a thousand times by the farmers that all they need do is to increase their rates whenever they increase their stock. They have gone on doing this until they can no longer pay regular dividends on their stock. In a few years, perhaps, they will be willing to pay a small bonus to any one who will send a carload over their track. But the directors of the Michigan Central are not drivelling idiots; they are, on the contrary, shrewd men, and men who wish to make everything they can out of their road; and the only explanation of the steady decline in the rates they obtain is that freight charges, far from being arbitrarily determined by the monopolists who own the lines, are fixed by causes over which they have very little control.

Of course it will be said at once that the Michigan Central is an exceptional case, but it is not. It makes little or no difference into which one of the great lines we examine, we shall find the same excuse given by the directors to the stockholders for not paying them more—the decline in freights. For example, Mr. John Taylor Johnston, President of the New Jersey Central, in his report for 1872, states the condition of his road to be as follows:

> "The gross receipts per mile run have been as follows: From passenger trains, $1 against $1 09 in 1871; from merchandise trains, $1 79 against $1 93; from coal trains, $1 74 against $2 55. The average receipts per mile run, from all trains, have been $1 46, against $1 85 the previous year."

The President of the Chicago and Alton, in his report for the same year, says that "the reduction in traffic receipts is due wholly

to the reduced rates received for the transportation of freight, the total amount being $132,560 17, or 3½ per cent. less than for the preceding year, while the tonnage transported shows an increase of $6\frac{88}{100}$ per cent." And that frightful monopoly, the New York Central and Hudson River Railroad, presided over by the notorious Vanderbilt, who has effaced the traces of his villany in an ocean of water, does, as our correspondent "W." himself admits, "60 per cent. more business than it did in 1860 for no greater aggregate remuneration."

But we have far more unbiassed testimony than that of the roads themselves. Mr. W. M. Grosvenor, formerly editor of the Missouri *Democrat*, has written for the *Atlantic Monthly* for November an article on "The Railroads and the Farms" in which he examines the subject in a spirit of sympathy with the farmers. What conclusions does he reach? In the first place, that the average receipts of the lines which do the main business between the West and New York for freight per ton per mile in 1860 was about 2·01 cents, and in 1871 the average was only 1·48 cents. On these roads "there has been a reduction of more than one-fourth the entire cost of transportation in 1860, and more than one-half of one cent per ton per mile."

We should be inclined to leave the matter here; for it is obvious that if there has been a steady decline of rates for the last ten years on the New York Central and Hudson, the Lake Shore and Michigan Southern, the Erie, the Pennsylvania Central, and the Pittsburg, Fort Wayne and Chicago, the monopolists have not yet "got it just where they want it." But Mr. Grosvenor finds that there are cases in which rates have increased. Local freights in the West are higher than they were in 1860. "In November, 1860," he says, "the rates charged in published freight tariffs for transportation between twenty Western cities averaged only one cent and a half per ton per mile; charges for similar distances in 1873 averaged fully two cents." Instead, however, of assuming that this increase is due to the godless greed of monopolists, Mr. Grosvenor has been at the pains of enquiring what natural reasons exist for this difference; and he finds several. In the first place, he asks a question which seems rather important to begin with in a discussion of this sort, but which is not unfrequently left out of view altogether: "What is a railway?" It is, as he says, an iron track nailed down by iron spikes, crossing streams on iron bridges, furnishing a highway for iron locomotives drawing cars, of which the wheels, axles, brake-rods, and braces are of iron. Now, in 1860, the average cost of railway bars was $48 per ton; but this price changed from $48 in 1860, with enormous fluctuations, to $85 12½ in 1872. It is unnecessary to go into details. We have here an increase of cost of nearly fifty per cent., which must be borne by somebody.

There only remains one question: Why is this increased charge thrown on to the short and local lines, and not divided equally among all? The answer to this is simple, and those who dislike to take Mr. Grosvenor for an authority will find that the reports of the Massachusetts Railroad Commissioners (whose chairman, Mr. C. F. Adams, jr., cannot be suspected of any excessive partiality for existing railroad management) lead inevitably to the same conclusions. The reason is that the increased *cost of transportation* falls on the shorter local lines more heavily than it does on the long ones. Without going into details, it is clear that if we have two roads the cost of which is equal, the rate for carrying one ton one mile will depend upon the number of tons moved, or, in other words, the business of the road. The iron costs the same, the rolling-stock costs the same, the fixed expenses are the same, but if one does a large business and the other a small one, the result is that the cost of moving each ton a mile in one case is smaller than in the other. If we imagine the two roads to be each exactly one mile long, and each to cost $50,000, while one moves annually one thousand tons of freight and the other two thousand, we shall see what an absurdity it is to suppose that the rates for transportation can be the same on both. "Rolling-stock constantly in motion," to use Mr. Adams's own phrase, as we remember it, is the secret of railroad profit. The most profitable of all railroads would be a gigantic circular road, on which an endless chain of cars was kept perpetually revolving, loading and unloading. The nearest approach to the ideal road is a great double-track through-line.

We now begin to get some light upon the great *pro-rata* principle adopted by the Illinois Legislature. The *pro-rata* theory is that distance shall govern rates; that is to say, that if a railroad charges one dollar for transporting a certain quantity of grain one hundred miles, it shall charge two dollars, no more and no less, for carrying it two hundred. The principle itself is, as we have just pointed out, sheer nonsense, for the rates must depend on the business done by the road, and not on the distance; and, in the second place, if adopted generally throughout the United States, it would establish, to use Mr. Grosvenor's words, "a fatal monopoly" against the Western farmers themselves, in favor of those who happen to own farms nearer the seaports or the water-channels. "In order to lower local rates, and yet obtain a living income, many roads in each State must raise their through rates. The present average charge for transportation of all kinds of freight over roads of all lengths is about three cents and six-tenths per ton per mile, . . . and the average charge for grain all distances, and over all roads, about two cents and four-tenths. If the roads should strictly equalize their rates for all distances, according to the average now charged for all, freight from Chicago to New York would cost $21 60 per ton, or 64 cents per bushel of wheat. Even if such rates did not depopulate that thriving city, they would at least put an end to wheat-growing in Illinois, except for home consumption."

We have now gone over the whole ground, and, we believe, shown conclusively that the argument on which the farmers' movement has been made to rest is a mountain of fallacies. That argument was, 1st, that stockholders in railroads earned gigantic profits—it is now generally conceded that they do not get on an average 6 per cent.; 2d, that there was some mysterious connection between watered stock and freight rates—we have shown that there is none; 3d, that freights from the West have increased—they have, on the contrary, diminished; 4th, that local rates are higher than through rates—it is quite clear that this is a natural consequence of the character of the business; and, 5th, that the true remedy was the equalization of rates—and the farmers are now beginning to see that the equalization of rates means the destruction of their own farms. At last we come to the real cause of complaint, which Mr. Grosvenor very naïvely makes in common with the farmers—that some few roads have been making more than 7 per cent. when the farmers were losing money.

In conclusion, it is only necessary to say that though we have quoted Mr. Grosvenor throughout this article, we have done so merely for convenience, because he assumes the rôle of Farmer's friend; and that our generalizations are made on our own responsibility. To any one at all acquainted with the real nature of the railroad question, they will probably seem to be truisms rather than startling discoveries.

THE COMANCHES AND THE PEACE POLICY.

[The following extracts from a private letter from an exceptionally qualified observer seem to merit a wider audience than the writer intended.]

Fort Sill, Indian Territory, October 5, 1873.

SINCE I have by way of holiday accompanied Gov. Davis, at his request, to the great Indian council to be held with the Comanches and Kioways at this post, I have somewhat of interest to write you. This is the best arranged and most complete military post I have yet seen. The barracks, officers' quarters, and quartermaster's buildings are built of limestone around a square parade-ground of near ten acres area. Hard by are a fine hospital and guard-house. All are kept in fine order by a garrison of (just now) five companies of colored cavalry of the Tenth Regiment, and two companies (colored) and one (white) of infantry. The colored troops (called by the Comanches the "buffalo soldiers," because, like the buffalo, they are woolly) are in excellent drill and condition. The Indians at first treated

them with utter contempt, and when they chanced to kill one would not take his scalp. After a while, when they had had a taste of their fighting qualities, they began to respect them, and to show their respect by scalping a few that they have managed to kill. These "buffalo soldiers" are active, intelligent, and resolute men; are perfectly willing to fight the Indians whenever they may be called upon to do so, and appear to me to be rather superior to the average of white men recruited in time of peace. Their officers explain this by saying that the best colored young men can be recruited in time of peace, while, under the same condition, only indifferent or inferior whites can in general be induced to enlist.

Two miles and a half from this post are the famous Medicine Bluffs, some 280 feet high, perpendicular on the side next the creek, and said to be of basalt. The Governor, Gen. Davidson, who is the commander of the post, with others, myself included, rode out to see them this afternoon, and passed through the Comanche camp, not far off on the other side. We were well armed, of course, and had a squad of "buffalo soldiers" along. The Comanches seemed to be a little shy, as some of them commenced herding their horses as soon as we came in sight, and one of them was sent off to a hilltop to see how many of us there were, and whether any other troops from the post were in the field. None of their chiefs came in to the council on Saturday, only Lone Wolf, Kicking Bird, Stumbling Bear, and a few others of the Kioway chiefs having been present. We then feared that, owing to the fact that they had learned that the Governor of Texas and divers other Texans were there, they had stampeded. After all, it is now probable that some of the Comanche chiefs may come in on to-morrow.

Mr. Secretary Delano has not appeared, and will not attend, but the Rev. Mr. Smith, the head of the Indian Bureau, with several of the Quaker superintendents and agents, are on hand. My conviction is that the Quakers and their policy are a bloody nuisance. Under their management this reservation has become a city of refuge for the Indians that maraud and murder in Texas. The Quakers can't keep them in the reservation. Bands of them go away from the proximity to this post that affords them protection, under the pretext of taking a buffalo-hunt on the plains, and turn up in Texas, where they help themselves to scalps and to horses, that can easily be identified by their brands when they get here. The Quakers will not let the military force them to give them up. This encourages the marauders to repeat their raids. The fact is that the chiefs of the Comanches have no authority, and are controlled or disobeyed with impunity by the young warriors. The government of the Comanches, if government it can be called, is a pure democracy. A chief who makes a large and successful raid may find more than a hundred lodges set up around his own. Afterwards, should he make a disastrous failure, his adherents may, almost to a man, move off and attach their fortunes to some more prosperous leader. A chief can exert only a moral power over his followers. Hence Comanche chiefs, like all democratic leaders with us, are thorough-paced demagogues.

October 6—10 P.M.

The council came off to-day, but what will be its results are not yet apparent. The chiefs of the Kioways, Comanches, Caddos, Wacos, and Apaches made their speeches—all full of promises and all winding up with the request that Satanta (who was present and spoke) and Big Tree should be released at once, as one of the Quaker agents in attendance had previously and without authority promised. Gov. Davis and Commissioner Smith also spoke and told them that those prisoners should not be released until the Indians themselves arrested and delivered up such of their young men as had lately made a raid into Texas, killing and robbing of their horses the people of our frontier. Besides, Gov. Davis made other and very proper demands of them, which you will see in print by the time this letter reaches you. Probably to-morrow the Indians will let us know what they intend to do. My belief is that they will evade complying with the requirements made. If so, an Indian war, for which the United States Government is not prepared, may be the result. Why it is that a large force is assembled at Fort Clark, near the Rio Grande, where it is of no use save to threaten Mexico—a country on which some of the powers that be at Washington want to filibuster—it is hard to comprehend. The troops here are not numerous enough for what they may be compelled to attempt. There are not horses enough to mount all the cavalry. An Indian war should always be an offensive war. It seems that General Davidson is inclined to think that the Indians may attempt to capture Governor Davis, in order to compel the immediate release of Satanta and Big Tree, as he has taken the precaution to order forward relays of cavalry to act as scouts to him and his party on their return through this and the Chickasaw reservations; and he has done that knowing that the Governor and those nearest him are armed with Winchester carbines. We expect to set out on our return to Caddo, on the M. K. and T. Railway, 162 miles from this post, day after to-morrow.

Quite a touching incident occurred just as the council had assembled and was about to begin. An aged and frail-looking but wiry old Indian, the father of Satanta, stepped forth, and made in the Kioway language, with earnest gesticulation, a strong appeal to Governor Davis for the release of his son, who sat on a bench close by under the guard of a few colored cavalrymen. The action of the old savage was so expressive that the aid of an interpreter was scarcely necessary; and as his speech was unexpected, no one interpreted what he said until he had closed his brief remarks and had stepped out of the council tent and taken his place among the spectators. Then the interpreter explained that he had said that he was no chief, but only a poor man, as the Governor could see, and an old man besides; that there sat his son guarded by soldiers; that Indians had as much affection for their children as white people; and that he appealed to the chief of the Texans to gladden his old heart by the immediate release of his son, who would never again raid upon Texas. Nothing could have been done or said under the circumstances that was more eloquent.

While walking around with others, looking at the fantastic dress and equipment of the Indians sitting on their horses who constituted the greater part of the audience, we noticed a young woman that had a cradle, apparently empty, hanging from the horn of her saddle. One of the party lifted the flap of calico that ordinarily shields the head of the child in a cradle from the sun, and then to our surprise we saw that in the cradle was a rosy-cheeked, flaxen-haired American doll. One of the party was so inconsiderate as to ask her through an interpreter why she carried with her the cradle and doll. The poor creature replied in a sweet-toned voice, and in an abashed and mortified manner, that it was her misfortune to be a childless wife, and that she carried the cradle and doll because she believed they would aid her in becoming a mother. I learned from one of the interpreters that the small Comanche-made dolls, fabricated of buckskin, beads, and silver, so as to resemble a Comanche warrior, one of which I gave the Smithsonian Institution in 1862 or 1863, are given by young wives to their husbands, and are worn on their breasts by the husbands with the same object that led the young woman to carry the cradle and doll.

By-the-bye, the best interpreter here, Mr. Jones of Fayette County, Texas, tells me that the Indians known as Comanches say that that name was applied to them by the Spaniards and others, and is foreign to their language, which is the court language of the plains. They call themselves *né-um*—the *e* having the sound it bears in the French alphabet, which he says signifies "our people." He also tells me that the language of this nation is continually changing. For example, when a woman who was known as "Tall-woman"—the word "wyepe" then meaning woman—died, they at once dropped the use of the word "wyepe," and invented and substituted the word "tootche" to signify woman in its place. So with other words. They told him they did so in order that the use of a word should not prolong their grief for the person whose name it constituted—that they had sorrow enough for the dead not to be reminded of them by their names. For this reason they bury their dead secretly in some obscure gully, and at once obliterate all trace of their graves. The burial, like most of their work, is performed by the women.

Ward, the sculptor, is here, and has just returned from a successful buffalo-hunt some thirty or forty miles west of this post—the northers not having yet driven the buffalo nearer. He is modelling a group to show how the Indians of the plains kill the buffalo. His model of the wounded buffalo is almost completed, and seems to be very good. He has made a model of the head of Satanta's son for one of the hunters. By-the-bye, that hopeful youth rode to the council to-day a horse which one of the Texans present recognized as his own property.

THE TRIAL OF MARSHAL BAZAINE.

PARIS, October 10, 1873.

I CAN hardly imagine a greater contrast than that between Trianon and the scene of which it is now the theatre. As I was driving last Monday in the great avenues which lead from Versailles through the park to the little palace which has become the prison of Marshal Bazaine, I could hardly realize the fact that I was going to attend a court-martial. Gay uniforms were shining here and there on the green foliage; but the eye is accustomed to see military uniforms in the park of Versailles. It required almost an effort of the imagination to remember that all these generals and officers were the witnesses summoned for the first day of the trial. The little palace fills three sides of a square, and the court which is left open between the central palace and the two wings was fairly glittering with uniforms. The left-hand palace was reserved for the witnesses (there are as many as four hundred,

and all of them had to make their appearance the first day). The wing on the right is the apartment of the Duc d'Aumale, the president of the court, and of General Pourcet, who conducts the accusation for the Government. The central palace has been arranged for the court; it is merely, in reality, a huge vestibule or promenade room. Great glass doors form a succession of arcades on both sides, and great columns support the roof on the inside. Through the glass doors one sees the gardens which are behind the palace on one side, and on the other the avenue which leads to Trianon. It was not easy to turn a place so open, so gay, so full of air and life, into a hall of military justice. Benches, wooden partitions, tribunes, tables and chairs on platforms, do not essentially alter the character of the place. Even the picture of Christ, which has been hung, us usual, over the chair of the President, has not been chosen among the stern masters of the ascetic school; it was probably taken from some chapel of Versailles, and belongs to the French school of the eighteenth century, which could not represent trouble, suffering, and sorrow even in a crucifixion.

As I was sitting in my place, waiting till the session should begin, the sun was streaming through all the high windows, and the pink marble columns of the hall reflected its rays in all directions. The young reporters in the tribune of the press seemed to enjoy the novelty of the scene. There were but few people in the audience, as the tickets had been very sparingly given. At twelve a door was opened, and an officer announced "The Court." One after the other of the judges entered in full uniform, with their hats on their heads, the Duc d'Aumale last of all, looking very grave and solemn. They sat down, uncovered themselves, and then the President bade a major of gendarmerie "Let the Marshal come in." It was a painful moment. The Marshal lives in another wing of the palace, which is not seen from the court where all the visitors to Trianon must arrive; this wing is connected with the central palace, and runs far out into the gardens. From the rooms where he is a prisoner to the hall where the council sits there is quite a long distance. After a painful suspense, we saw suddenly the Marshal appear, followed by the major of gendarmerie. He wore the dress he had at Metz during the campaign, his great *cordon* of the Legion of Honor, and the common military medal which is given to privates; no other decoration. He looked fat, pale, very yellow—his hands swollen; his long confinement, which has now lasted more than a year, seems to me to have affected his health. He fences a short time every morning, as he cannot take any other exercise. The Duke had to ask him the ordinary questions, as to his name, age, profession, domicile; these commonplace interrogatories and their answers had assumed under the circumstances a sort of tragic character. The Duke put the questions with a courteous dignity; the Marshal answered with a painful brevity. Then he sat down, and remained motionless during more than three hours. He felt that every eye was on him; he only gave a rapid glance at the audience; but he could study at leisure the face of General Pourcet, the prosecutor, who sits opposite to him; of the *greffiers* (the military clerks who have to read all the documents handed to them by the President), and of the judges sitting round a circular table. He never spoke once to his advocate, M. Lachaud, who sits by him in his black gown, assisted by his own son, who belongs also to the Paris bar.

Inspired by a generous feeling, the President ordered the clerk to read before any other document the "état de services" of Marshal Bazaine. Every man in the French army, from the private to the general, has a record kept of his services. This record merely mentions the dates of the promotions, the number of campaigns, the wounds received, and so on. Judged merely from a military point of view, the record of Marshal Bazaine is surely a fine one. Out of thirty-six years of service, he has actually during thirty-two years been campaigning—in Africa, in Spain, in the Crimea, in Italy, in Mexico. He enlisted at the age of eighteen as a private, and he has been one of the few for whom the famous proverb has proved true, "Every French soldier has in his knapsack the bâton of a marshal." He was born at Versailles, and, strangely enough, it is at Versailles that his long and sometimes glorious career comes to an end. His hand, which he kept constantly under his chin, moved nervously at times when the dates of his promotions were mentioned, or the dates of the days on which he had received wounds on the battle-field. On one of his epaulettes, which he wore at Metz, is still to be seen the mark of a German ball. Then the clerk began to read the report of the Commission of Enquiry which had to examine into the causes and the circumstances of the capitulations of Strasbourg, Toul, Metz, etc. This report was made by Marshal Baraguey d'Hilliers, an old soldier of Leipzig. It was very severe, and it obliged the Government to bring Marshal Bazaine before a council of war. The third document which was read was the report of General Rivière, which forms the indictment against the Marshal. This report is a great work in itself. It covers 900 manuscript pages, and will form a volume when printed. General Rivière is an officer of engineers, of great capacity. He was chosen by M. Thiers as the reporter, and did his best to avoid such a heavy task. M. Thiers was very anxious that the Bazaine trial should be almost indefinitely adjourned, and even hoped that it would really never take place. He believed that Rivière, who has the manners of a very timid and cautious man, would conduct the affair under his own inspiration; but General Rivière combines the *fortiter in re* with the *suaviter in modo*. He warned M. Thiers that if the task of enquiring into the conduct of Marshal Bazaine was entrusted to him, no considerations of a political, military, or personal character would stop him. And nothing has stopped him. His report is the most terrible indictment that could be imagined. It has taken everybody by surprise. It is so long now since the capitulation of Metz took place that many thought that the trial of Bazaine would be almost an empty formality; but now every paper publishes the report day after day, as fast as it can be read by the clerk, and each day adds more weight to the accusation.

On the first day a very short part of the report could be read, as the counsel had to go through the ceremony of making the call of all the witnesses. The scene of their *défilé* before the court was very impressive, and must have been very painful to the accused. Here were many men whom he had not seen since he led them in captivity to Germany. First of all appeared Marshal Canrobert, in his worn-out uniform, and with his long flowing hair. He alone of all the Marshals comes off triumphantly at the hands of General Rivière. "His conduct on the battle of the 16th of September, one of the three giant battles which determined the fate of Metz, was heroic," says the report. During the whole day, Canrobert was left to struggle with one corps d'armée, already weakened by the battle of the 14th, and with 86 guns, against three German corps and 290 guns. He was at the right of the French army, and every hour he sent pressing despatches to Bazaine in order to get reinforcements. But Bazaine, on that fatal day, seemed to be preoccupied only with his left, as he feared that the German army would slip between his left and Metz, and thus cut him off from the fortress where he was determined to remain, waiting for the issue of the campaign. Canrobert kept his ground till night came, against overwhelming numbers; he saw at a distance the Imperial Guard and its reserve artillery, which was never brought into action. The glorious veteran bowed very proudly when he was called before the Court to say "Present!" How different, how painfully uneasy was the attitude of those who followed him—of Marshal Lebœuf, once so handsome and young-looking, now looking like an old man; of Frossard, who lost the battle of Spicheren, partly by his own fault and partly because Bazaine did not help him. What must Colonel Stoffel have felt when he appeared? Everybody knows now that the Report proves him to have suppressed a telegram addressed by Bazaine to Marshal MacMahon, which would perhaps have stopped the army of Châlons on its fatal march to Sedan. What, too, Major Magnan, the son of Magnan, one of the generals of the *coup-d'état* of December, who was sent by Bazaine on a mission to the Emperor after Napoleon left Metz, and who is shown by the Report to have acted in a most mysterious and extraordinary manner—and many others whom the Report unsparingly denounces as the docile and weak instruments of Bazaine's designs? There is a terrible force in conscience. I could almost have noted, before the reading of the Report, by the behavior and attitude of each witness, if his part had been noble and pure, or if he had some painful memory on his mind. Two or three generals who, notwithstanding the orders they had received, burned their regimental flags before the capitulation, answered very boldly to their names. The famous Régnier, who was a conscious or unconscious tool of Bismarck, and who became a sort of unofficial negotiator between the Germans, Bazaine, and the Emperor, was regarded with much interest; he is a vain man, who is satisfied with producing a sensation. He now lives quietly in the neighborhood of Paris, and seems quite delighted with what he regards as his popularity. The witnesses on whom I looked with the greatest satisfaction were those humble men of Metz and of Lorraine, wood-keepers, cart-drivers, custom-house officers, who at the risk of their lives carried the despatches of Bazaine and MacMahon across the German lines. There were also some privates of the army and many humble persons who played an obscure part in the great drama of the war. The Marshal looked well at the witnesses; there was probably not one whose name or face did not recall to him visibly some incident of the siege. These men were his real judges; on their testimony hangs his fate. And what fate? The judges have no choice; the questions which will be put to them by the President are determined by the military code. Has the Marshal or has he not signed a capitulation in the open field? Has this capitulation had for its consequence the disarmament of an army? Was it signed before he had done all that honor and duty required? If five judges out of seven answer these three questions unfavorably, the Marshal, by the terms of the military law, will be condemned to be shot. If they answer unfavorably to the two first and favorably to the third, his

life will be safe, but he will lose all his dignities in the army and in the Legion of Honor. The second and third questions can be put together or put separately; but the first, which is a question of mere fact, must be put separately. You may easily judge what the perplexities of the tribunal will be, since the military code shuts them up, as it were, on the narrowest ground.

Correspondence.

A POOR RULE THAT WON'T WORK BOTH WAYS.

To the Editor of the Nation:

Sir: Enclosed please find $174 75 in return for services rendered me by the last number of your paper. Perhaps a little explanation is necessary in this connection.

Last week I was in doubt and dismay, due to the fact that my otherwise exemplary tailor had signified his intention of withholding further advances until I should be prepared to settle the "little account" already upon his books. What was I to do? Third-Street operations had left me no funds to be fooled away in paying bills, and here were the numerous requirements of my winter wardrobe looming up stern and solemn upon the horizon. Charming patterns that I had selected were melting away and moulding themselves to the forms of more lucky customers—bank clerks, who could advance to themselves trifles from the vaults—trustees, executors, or what not, with convenient funds at hand, while I, a poor man of law, had no fiduciary relations save with my trusting creditors.

It was then that your paper of last Thursday came to my rescue. The letter of "U. H. C." upon the *Alabama* Claims spread its balmy reasoning upon my spirit. I arose, and girding myself, went unto my tailor and said: "Make me new garments, for, lo, thy bill is paid." As the sad corners of his mouth tilted upwards in joy, I continued subtly, "Frösch, your prices are very high." "My dear sir," said he, "it is only by charging fair prices that I can protect myself against bad debts, for we have many losses from you gentlemen, and can barely live so—" "Stop, my friend," I replied; "do you mean to tell me that you charge thus much to average your bad debts, and in the same breath ask me to pay up my account? For shame! Am I not a bad debt, and if I should not pay you, how can you lose when you have increased your rates to cover such accidents? Be thankful that you are not publicly denounced for these iniquitous attempts to recover your money twice. Let the fate of those wretched insurance companies, who demanded a share of the eagle's plunder, be a warning to you; and here, give me a receipt and sin no more."

As I walked homeward with triumph in my heart and the receipted bill in my pocket, I felt that such teachings should not be unrecompensed, and resolved to send you one-third of the amount saved by your timely counsels.

"There is but one logic, and 'U. H. C.' is its prophet," said I, and fell to reading again the letter in the hope of drawing fresh aid and comfort from its lines. But, alas! what is there perfect under the sun? The letter goes but halfway, and my cherished preceptor stops short of his own proper conclusions. Hard as it is, I must speak out, for I am borne along by the current of my own irresistible logic. Why should we, the people of the United States, keep this money? It is true that the owners of destroyed ships are not entitled, nor yet the insurance companies, for both have made money in some mysterious way out of their losses. It is likewise true that the people have felt, in the increase of prices of imported goods, the depredations of the cruisers. But is this all? If goods from abroad have increased in price, it must follow that we have *bought less*, otherwise we have not suffered; and, if we have bought less, then we have diminished the market for the poor manufacturers and exporters who live abroad. They are the real sufferers—the workmen of Leeds and Manchester, of Lyons and Geneva. Since it is our duty to go to the bottom of this thing, let us not flinch, but declare ourselves trustees for the benefit of these unhappy ones. Let us (first deducting the price of those silver articles at Tiffany's) pay over to the governments abroad this sum that we justly owe, and sit down wrapped up in our logic, an example to all time of syllogistic honesty.

Such, dear *Nation*, are the conclusions to which I am led, and thither must I carry "U. H. C." I am sorry for him, but it is written of old:

"Trepidumque magistrum
In cavea, magno fremitu, leo tollet Alumnus."

Let us be not only generous but just, as long as it is somebody else's money we are dealing with.—Yours truly, Strepsiades.

P.S.—I forgot to enclose the $174 75, but as you doubtless expect little accidents of various kinds in the post-office, and base your rates accordingly, it will be of no consequence, as you suffer no loss. Send me a receipt, however, by return mail. S.

Philadelphia, October 27, 1873.

THE WATERED-STOCK HALLUCINATION.

To the Editor of the Nation:

Sir: It seems to me that there is a very short and conclusive answer to the position taken in the article in the *Nation* of October 9, entitled "The Watered-Stock Hallucination." It is very true, as alleged, that no roads can be indicated which have increased, or attempted to increase, their freight charges by reason of any increase in their capital stock or debt; but it is equally true that many roads can be named which pay interest, or dividends, on stock, or acknowledgment of indebtedness, which do not represent any capital directly contributed by the stockholders; and, furthermore, that by reason of such payments service is not performed for the public at as low rates as it probably would have been had not such additional stock or debt been created. Of the truth of this position, the New York Central road, under its present organization, is a striking example. Thus, this road now pays annually some $3,000,000 of interest on stock which, by the acknowledgment of its managers, represents only the result of the earnings of a series of years, over and above a high rate of interest on all that has been required to build and equip the road—*i.e.*, upon an increased value of property which has accrued from circumstances wholly independent of any agency or action of the railroad company. It is true that the New York Central has not increased its rates of freight either in proportion to or in consequence of the great increase of its stock referred to, but, on the contrary, does sixty per cent. more business than it did in 1860 for no greater aggregate remuneration. But, granting all this, it in no way affects the premise that if the New York Central had not, by the creation of this additional stock, unnecessarily obligated itself to pay $3,000,000 annually additional to such an account, it might have applied this $3,000,000 to the reduction of its freight tariff, and therefore, to just that extent, have benefited the public by affording them cheaper services and greater facilities. And, if this position be correct, it is difficult to see wherein the "hallucination" of watered stock consists, or why the grievance alleged is not in every respect a real and a true one. The question interesting the public is not in any sense, "Have railroads increased their freight charges by reason of an increase in their debts or stock capital?" but rather, have they been so managed as to give to the public the cheapest service and the greatest facilities conjointly with paying a liberal rate of interest on the money actually subscribed and contributed to build and equip them? W.

New York, Oct. 16, 1873.

To the Editor of the Nation:

Sir: I have read with profit and pleasure your various articles on the transportation question, and while agreeing with you in the main, I deem that the article in last week's issue, on the "Watered-Stock Hallucination," does not quite do justice to the position of the farmers.

Without presuming to speak for them, and without even being in sympathy with their present movements, I understand their argument to be as follows:

1. That railroads are so superior to all other known means of land transportation, in point of cheapness, comfort, and speed, as virtually to supersede them all, except for very short distances. That each road hence acquires a quasi monopoly of the carrying trade for a strip of country, varying according to circumstances, along the line; and that competition is only possible by another railroad in the same section.

2. That if competition is attempted by building another railroad through the same strip of country, experience has proved that after a struggle, more or less protracted, either the one line is purchased by the other, or both combine to "restore rates," and compel the public to pay returns on the capital invested in the two roads, when one road would probably have answered all the purposes of the country.

3. That competition thus becomes possible only near the intersecting points of various railroads, which elsewhere escape the commercial laws of competition and of supply and demand, which regulate other branches of business.

4. That the progress of consolidation of the roads, with their branches, feeders, and competing lines, is irresistible; and that though, upon the whole, it is beneficial both to the companies and the public, as promoting harmony, efficiency, and economy in their management, and best that it should continue, still the effect will be to give the lines a quasi monopoly over whole districts of country, instead of over the strips now controlled by them.

5. That it is advisable, therefore, that the profits of the railroads should be limited to a fair return (say a fixed average for a series of years) upon the capital actually invested in them, and that this should no longer be wholly left as now to the conscience of the managers.

6. That as business increases on a road which has been exceptionally

well placed, it is advisable that the rates should be lowered, so as to yield the same average return upon the capital then actually invested, rather than that watered stock should be issued, to represent the increased earnings obtained from the national growth of the country, and not from any fresh expenditure of capital.

7. That inasmuch as the practice has become of late all but universal in the West of building railroads from the proceeds of bonds, and issuing a majority of the stock as a bonus, indicating an expectation on the part of the owners that they will eventually be enabled, either by combination or from the growth of the country, to obtain returns upon the fictitious as well as the actual capital, it is advisable to settle the question now, and to begin the solution of the transportation problem.

I believe it is against the possible dangers of the future, more perhaps than against any present oppressive charges, that the clamor of the Western farmers is now directed. The agitation undoubtedly began in the effort to secure a reduction of freight rates in order to relieve the glut in the corn market which occurred last winter, but this having been refused, the discussion has now taken a much wider range. Like all popular movements in their inception, this clamor is, to a certain extent, vague and uncertain, both in its utterances and purposes, and without settled plans or course of action. The railroads are simply charged with making profits which are too large, a remedy is sought through legislation, and Illinois, as of right, takes the lead in this movement.

It now seems quite certain that the present law of Illinois will fail, and that, like the one which it superseded, it will afford no relief or security to the people. But this will by no means be an end of the matter. The Western people fear very much that when further consolidations and combinations take place, they may be compelled to pay charges but little lower than the cost of wagon transportation, and that all their early aid and sacrifices to secure railways may be lost to them. Against this possible danger they are determined to provide now. They are resolved to limit the profits which the railroads can make out of their business, and as they own little or none of the stocks and bonds of their railways, as few even of the officers and employees who operate them have any personal interest in them or share in the profits, there is little conservative element in the West to resist the popular clamor, which in my judgment threatens great future mischief.

While, however, there is a great deal of loose talk by the would-be leaders of the movement, I do not understand the farmers to claim, as your article might lead some to suppose, that the stocks have been watered by the directors for the express purpose of raising the freight rates, or indeed that there is any necessary connection between the two. They claim, rather, that the capital accounts of the railroads having heretofore been swelled to a fictitious amount, either to conceal the real percentage of profit of prosperous years, to cover surplus earnings reinvested in the railway, to represent future anticipated profits, or the thefts of the managers, it is not fair, now that in their distress they ask for a reduction of the rates, that the railroads should plead the necessity for paying returns upon this fictitious capital as a bar to the granting of their request.

KANSAS CITY.

THE "PAR VALUE" OF STOCK.

TO THE EDITOR OF THE NATION:

SIR: Your article on "The Watered-Stock Hallucination" in the *Nation* for October 9 is timely and eminently sound; but is there not another "hallucination" in watered stock which you do not mention, and which—unlike most railroad problems—is within reach of legislative remedy? I refer to the fictitious figure known as the "par value," and which alone affords the reason for watering.

The holder of a certificate of stock in any railroad is really the actual owner of a certain undivided portion of the road-bed and rolling-stock; the process of watering may double the number of stock certificates in his hands, but he owns no more of the actual road-property than he did before, as all the stockholders have had their stock watered in like proportion; but the fictitious quantity known as the "par value" has been doubled on his hands. If a road costing ten millions of dollars issues one hundred thousand certificates of one hundred dollars each, *par*, the holder of one of these certificates owns exactly $\frac{1}{100,000}$ share or part of the road. No amount of watering will increase his interest in it. Then why not at once issue certificates that shall say, "John Doe is the holder of $\frac{1}{100,000}$ part of the —— railroad"? This could never be watered, as no act, except his purchase of more stock, could make the holder entitled to $\frac{2}{100,000}$ part.

The fact is, the nominal "capital stock" of all railroads is a fictitious figure. A share of railroad stock is never worth the "one hundred dollars" it claims as its value—except, perhaps, as a broken watch is right once in the day, there may be an appreciable moment when it can be sold at exactly one hundred dollars. But look at the stock quotations. Not a share sells at one hundred dollars, though all claim to be worth just that sum.

Why not end this nonsense of "par values" at once? Why not let railroad companies pay whatever it may cost them to build, and not have in their charters any "authorized capital stock," or sham limit of any kind, and forbid them to express any money value on their certificates, making them read for such and such a fractional interest in the road? They may then issue what they choose, and divide the property into as many fractions as they choose. They may even subdivide in future if they like, but as they affix no definite value in dollars to these fractions, they cannot substitute any equivalent for watering.

This "watering" is an hallucination to stockholders as well as to farmers. Let both unite and reform the awkward legislation that compels railroad companies to fix this sham "capital stock" limit. Next, make all railroad stock invalid that calls a share "one hundred dollars," or fixes any definite value, and enact that each certificate shall state only the fractional part of the whole property it represents. Is a remedy to this extent practicable, or is it not? J. W. A.

SAN FRANCISCO, October 17, 1873.

[Our correspondent, it will be seen, takes somewhat the same view of the subject expressed by ourselves in another column, and punctures the watered-stock bladder. It is not, however, legislation alone which fixes the nominal par of stock, but the convenience of buyers and sellers, who must have some standard by which to measure fluctuations of value. The stock in the Calumet and Hecla Copper Mine, for instance, is always quoted with reference to the par of one hundred dollars, though nobody knows what the real par is. But we confess we see no very good reason why a certain fractional interest should not be quoted in the stock-lists as well as a nominal sum of money.—ED. NATION.]

Notes.

A CIRCULAR which has been sent us from the University of Vermont, calls attention to the fact that as long ago as 1830 this institution introduced into its course systematic instruction, by lectures, on the theory and principle of the fine arts. Provision has now been made by Mr. Trenor W. Park, of Bennington, for an art-gallery, by the addition of a third story to the library building. The trustees solicit works of art of unquestionable merit, or funds with which to procure them, from all who are disposed to take an interest in this enterprise. ——At the late meeting of the American Antiquarian Society, in Worcester, Mass., steps were taken to renew the inscription on the stone over the grave of Captain John Smith, in England, and to have a memorial tablet placed in the wall of the church.——T. Whittaker announces 'Ecclesiastical Polity of the New Testament,' by Rev. G. A. Jacob, D.D.; and 'Unity not Uniformity,' by Rev. Warburton Weldon, M.A., of Trinity College, Cambridge.——Henry Holt & Co. have made an arrangement with the author's executor to publish the 'Autobiography of John Stuart Mill,' and expect to issue the work in November. They also announce a uniform edition of Mill's Miscellaneous Works.——A. D. F. Randolph & Co. have in press 'Popular Objections to Revealed Truth,' the third volume of the Christian Evidence Society lectures.

—The Oriental Society held its autumn meeting in New Haven on the 15th and 16th of October, eliciting some papers of decided value. President Woolsey treated briefly of the Orphic poets and their influence upon the religious development of Greece. Professor Salisbury discussed the relations of Islamism to Christianity, giving an analysis of the controversies between European missionaries and the defenders of the Mohammedan faith, and criticising the manner in which they had been conducted. Dr. Martin, the head of the Chinese College of Western Science in Peking, had sent a long and full historical account of the famous Han-lin, or imperial academy, the organized association for literary purposes of the leading scholars of the Chinese Empire. Professor Avery, of Iowa, furnished a complete classified statement of the occurrence of verbal forms in the Aitareya Brahmana, a chief work of the second period of Hindu literature. He had before given similar statements for the Sama-Veda, of the first period, and the Nala and Bhagavad-Gita, of the later or classical period. Professor Toy, of South Carolina, criticised J. G. Müller's curious theory that there is no such thing as a Semitic race proper, the so-called Semites being merely Indo-Europeans who have learned Hamitic dialects; he pronounced it paradoxical and untenable, and was supported by the expressed opinions of other members in

debate. Professor Whitney reviewed the later discussions in Germany as to the primary division of Indo-European language, pointing out that the prevalent opinion is now in favor of a first separation of the family into an Asiatic (or Aryan) branch and a European, all the European tongues being thus more nearly related to one another than any one of them to Sanskrit or Zend; he also especially commented on the recent attempt of Johannes Schmidt to disprove the "family-tree" arrangement of the branches altogether, and substitute for it a kind of affinity by geographical neighborhood; this was contended to be a vain endeavor, made futile by all our positive knowledge of the history of language. Rev. Dr. Ward, of this city, exhibited the original squeezes, taken by members of the Palestine Exploration Society at Beyrout, of the Hamath inscriptions, which have been attracting so much attention of late; also, the plates which had been carefully prepared from the squeezes for publication by the Society. The characters are hieroglyphic, but of a system apparently wholly unconnected with the Egyptian. Hardly anything has been as yet found out about the inscriptions except that their arrangement is *βουστροφηδον*; *i.e.*, that the alternate lines read in opposite directions. It is very doubtful, too, whether more will ever be found out. Whether this be so or not, the discovery is a very interesting and even a very important one in its bearing on the history of writing in that region of independent and seemingly unconnected systems. Dr. Ward was inclined to think the inscriptions very ancient—earlier than the earliest Phœnician.

—It is worthy of notice that there is in existence no complete edition of Keats's poems. The volume belonging to the 'British Poets' series, published originally by Messrs. Little & Brown of Boston, but now by Messrs. James R. Osgood & Co., is tolerably complete;—that is to say, in the second edition, which contains 'To Fanny' and twenty sonnets (some of them the best Keats ever wrote) which do not appear in the first edition. Of those collections published in England Lord Houghton's is the best, though Mr. W. M. Rossetti's contains some verses which are not found elsewhere. The last-named omits, however, many which are printed in the American edition, as may be seen by the following list: "I stood tiptoe upon a little hill"; "Specimen of an Induction to a Poem"; "Calidore, a Fragment"; "To some ladies on receiving a curious shell"; "On receiving a copy of verses from the same ladies"; "To Hope"; "Woman, when I behold thee flippant, vain"; "Ode to Psyche"; "Fancy"; "Ode" beginning,

"Bards of passion and of mirth";

"Lines on the Mermaid Tavern"; "Robin Hood"; "Sleep and Poetry"; the three epistles, to George Felton Mathew, to his brother George, and to Charles Cowden Clarke, and thirty-six sonnets. Partly to outweigh this striking inferiority, it contains the poem beginning,

"Think not of it, sweet one,"

which is also in Lord Houghton's edition, as well as the following, which are in Mr. Rossetti's alone, viz.: the sonnets to Spencer, to Chatterton, to Byron, and on visiting the tomb of Burns; a fragment of a sonnet, "From Ronsard"; lines "On seeing a lock of Milton's hair"; "A Reminiscence of Claude's Enchanted Castle"; "Written in Devonshire"; and "Song" beginning,

"Where be you going, you Devon maid?"

(both of these are given in Lord Houghton's 'Life of Keats,' though they are not included in the collection of the poems); "Written on May-Day"; "Written after visiting the Birthplace of Burns"; on "A Prophecy"; and some less important works, such as, "A Portrait"; "A Spenserian Stanza"; "Modern Love"; fragment of the "Castle-Builder," etc. Besides these shorter pieces, we find an earlier version of "Hyperion"; "The Cap and Bells; or, The Jealousies: a faery tale"; "Otho the Great: a tragedy,' which Keats wrote in conjunction with a friend of his, and dreary stuff it is; and "King Stephen: a dramatic fragment." Lord Houghton's edition also lacks all of these, and, besides, of what is contained in the American edition, "Fingal's Cave" and the following sonnets: "On Seeing the Elgin Marbles"; "To Haydn: with the preceding sonnet"; "Written in the Cottage where Burns was born"; "To the Nile"; the mate of Shelley's "Ozymandias"—not in merit, that is to say, but in time of composition; "On sitting down to read 'King Lear' once again"; and "Read me a lesson, Muse, and speak it loud." On the other hand, it contains an "Ode to Apollo" and half-a-dozen smaller pieces, which are to be found nowhere else to our knowledge. Another edition, also published by Moxon, is the same as the American as far as the sonnet, "To Ailsa Rock"; all the rest is omitted. It is illustrated very unsatisfactorily by Mr. George Scharf, Jr. With this wide divergence in the merits of the various editions, it might seem as if a plan to issue a complete, carefully-edited collection would deserve encouragement.

—In the issue of *Nature* for October 2, Mr. Alfred Russel Wallace indulges in some speculations on the probable antiquity of the human species which may well startle even those who have long since come to the conclusion that six thousand years carry us but a small way back to the original *homo*. In fact, in Mr. Wallace's reckoning, six thousand years are but as a day. He begins by complaining of the timidity of scientific men when treating of this subject, and points out the fallacy of always preferring the lowest estimate in order to be "on the safe side." He declares that all the evidence tends to show that the safe side is probably with the larger figures. He reviews the various attempts to determine the antiquity of human remains or works of art, and finds the bronze age in Europe to have been pretty accurately fixed at 3,000 to 4,000 years ago, the stone age of the Swiss Lake Dwellings at 5,000 to 7,000 years "and an indefinite anterior period." The burnt brick found sixty feet deep in the Nile alluvium indicates an antiquity of 20,000 years; another fragment at seventy-two feet gives 30,000 years. "A human skeleton found at a depth of sixteen feet below four buried forests superposed upon each other, has been calculated by Dr. Dowler to have an antiquity of 50,000 years." But all these estimates pale before those which Kent's Cavern at Torquay legitimates. Here the drip of the stalagmite is the chief factor of our computations, giving us an upper floor which "divides the relics of the last two or three thousand years from a deposit full of the bones of extinct mammalia, many of which, like the reindeer, mammoth, and glutton, indicate an arctic climate." Names cut into this stalagmite more than two hundred years ago are still legible; in other words, where the stalagmite is twelve feet thick, and the drip still very copious, not more than a hundredth of a foot has been deposited in two centuries—a rate of five feet in 100,000 years. Below this, however, we have a thick, much older, and more crystalline (*i.e.*, more slowly formed) stalagmite, beneath which again, "in a solid breccia, very different from the cave-earth, undoubted works of art have been found." Mr. Wallace assumes only 100,000 years for the upper floor, and about 250,000 for the lower, and adds 150,000 for the intermediate cave-earth, by which he arrives at the "sum of half a million as representing the years that have probably elapsed since flints of human workmanship were buried in the lowest deposits of Kent's Cavern."

—To judge from a recent article in the *Spectator*, it seems that Strauss's last book is likely to give rise to some lively discussion about the relation between religious and political faiths. Strauss believes in a strong government, and at the same time Strauss in religion is, to say the least, liberal. Some people in England, the *Spectator* thinks, are astonished at what they consider the inconsistency of such a position; but this astonishment is "founded upon no basis whatever, except that our history has induced liberalism to ally itself in many cases with attacks on the church which do not spring from disbelief, but excessive belief in individualism as applied to religion, and that our aristocracy is, as a body, rather stupidly orthodox." To point the moral, the *Spectator* refers darkly to a certain class of Englishmen who have but small religious belief and equally little liberalism in their composition. "One dislikes to mention names, but certainly many among us with very few rags of religious belief still clinging around their souls are intellectually fierce and domineering oligarchs, who hate ochlocracy as Strauss does, who utterly distrust the multitude, and who would, if they could, deprive it of all power. Their arrogance is, no doubt, in part the arrogance of mental power, of a new priesthood cock-sure of everything that is doubtful, and ready to compel all beneath them to believe without understanding; and we have little doubt that an aristocracy of culture, were it as possible as it is not to invest it with power, would be both unbending and cruel." Notwithstanding the disinclination of the *Spectator* to mention names, we learn from the rest of the article that this band of domineering oligarchs is headed by Mr. Fitzjames Stephen, author of 'Liberty, Equality, Fraternity,' and that its organ is the *Pall Mall Gazette*, a newspaper which "sometimes seems ready to let a whole pauper district perish of fever rather than allow a cab to convey the infection to one cultivated man"—certainly a most reprehensible state of mind. It would be interesting to know whether any connection can be traced in this country between the occupation of the men inside politics and their religious faith. Are the members of the Custom-house ring, for example, sceptics in religion? Is Thomas Murphy a reader of Thomas Paine? Do Messrs. Bliss and Davenport spend much of their time over Voltaire or Renan? As we draw nearer and nearer the beginning of Grant's third term, these questions become interesting.

—A few months ago, we called attention to an article on the Germanic invasions in the *Revue des Deux Mondes*, by Fustel de Coulanges, the upshot of which was that it wasn't much of a shower, after all. It was a part of the old controversy between French and German interpretations of mediæval institutions, and the violent prejudices of this writer are no doubt connected with the fact that he was formerly a professor at Strasbourg. A recent

number of the same review (July 15) contains an article by A. Geffroy, which discusses the same subject in a calm and impartial tone—a less brilliant and suggestive article than that of Fustel de Coulanges, but containing an admirable summing-up of the points in dispute. M. Geffroy concludes that there was a conquest, even although its violence may have been exaggerated by some writers; and, secondly—a point of more importance and significance, inasmuch as the first may almost be called self-evident—that this conquest was, on the whole, salutary, especially in introducing the character of personality, and developing a liberal system of administration. It is refreshing to find French writers who are willing to discuss these historical questions in a purely scientific spirit; it is a good sign.

—M. Taxile Delord has resumed in a third volume his not flattering 'History of the Second Empire,' which had been interrupted by the events which led to the Imperial overthrow. His first volume embraced the period 1848–1856, his second that of 1856–1860. The present carries down the history to 1864; and as the former treated respectively of the Crimean and Italian wars, so this deals, among other matters, with the expedition against Mexico. The author continues to receive the praise of those who differ from him both theologically and politically for his impartiality and accuracy. He had originally assigned 1869 as the date at which his work would terminate; but doubtless he will not now fail to extend it another year *ad finem*. M. Gaidoz calls attention in the *Academy* to one of the useful creations of the Second Empire which was not interred with its bones. This is the Commission for the Topography of Gaul, established in July, 1858, by the author of the 'Vie de Jules César,' as an aid in the prosecution of that work, though in the last years of his reign he seldom consulted them. Besides the excavations which they have carried on, and the general impulse they have given to antiquarian research in France, they have published (1) an oro-hydrographical map of Gaul, in four sheets; (2) a map of Cæsar's campaigns, now out of print; (3) a map of Gaul under Cæsar's proconsulate, in four sheets like the first; (4) three parts of an Archæological Dictionary of Gaul—Celtic Period, containing forty-two quarto sheets and forty engraved folio plates, the text going as far as the letter D, and giving a résumé of the archæological history of each locality whose name is set down; (5) a map of Gaul indicating the site of dolmens and megalithic monuments; (6) the same for inhabited caverns of prehistoric times; (7) a preliminary map of Gaul in the fifth century B.C.; and (8) instructions for correspondents of the Commission. They have also in view a map showing the geographical distribution of the Gallic tribes, and a Dictionary of Gallo-Roman archæology, from the reign of Augustus to the Frankish kings. The non-private publications of the Commission, and such as are not out of print, can be had at the Librairie Militaire de Dumaine in Paris.

—We recommend to those whose business it is to supply our Congressmen with penknives, toothpicks, 'Cushing's Manual,' and fancy stationery a cheap legislator's vade-mecum—the *Annuaire de législation étrangère*. This useful annual is published at the price of 12 francs by the Society of Comparative Legislation, and the present issue (the second only) contains a translation of the principal laws passed in 1872 in the following countries: Great Britain and Canada; the United States, and severally Illinois, Massachusetts, and New York; German Empire, Prussia, and Baden; Austria, Italy, Spain, Belgium, Holland; Switzerland and the Canton of Geneva; Scandinavian States; and, finally, Alsace-Lorraine. The table of contents is arranged by topics of legislation, and renders reference and comparison extremely easy. The translations are by very competent hands, and are frequently, if not always, annotated.

—The westernmost branch of the great Slavic family, the Wends of Northern Germany, are the subject of an interesting paper in the last number of Dr. Petermann's *Mittheilungen* (Aug. 21). They bear the most ancient designation of that family (Venedi), between which name and that of the Vandals there is an obvious resemblance but no near race connection. Their home is on the banks of the River Spree, which, from its rise on the Bohemian frontier, through half its course to Berlin, divides about equally the inhabitants of Upper and Lower Lausitz. Formerly this territory, regarded as a *Sprachgebiet* in which the use of the Wend language universally prevailed, reached almost to the Prussian capital, having for its northern boundary in 1550 the line Storkaw-Beeskow-Fürstenberg. Now, however, the line has retreated to 12 to 15 miles north of Kottbus, while a corresponding shrinkage has taken place on the eastern and western confines, leaving the Wend-speaking population little more than a third of their original extent of country, and by so much diminishing their hopes of joining the political Panslavic fraternity. It is the aim of Dr. Andree, the writer in the *Mittheilungen*, to trace the successive reductions of this *Sprachgebiet*, and a colored map which accompanies his essay shows the boundaries in 1550, 1750, and 1872 respectively. It is clear to the eye that the rate of Germanic encroachment in the last hundred years has been greater than in the preceding two hundred, and it is certain that less than another century will suffice to effect the disappearance of the nationality and the language of the Wends. The Germanizing of this isolated Slavic community will proceed all the more rapidly in consequence of the Prussianizing of Germany. Lower and part of Upper Lausitz are included in Prussia, the rest in Saxony, Dresden being even nearer than Berlin ever was to these districts; but on the side of Saxony there has been very little German assimilation. Of late, however, the universal obligation to serve in the army has had a powerful effect in spreading the use of German among all classes, and the railroads, which long since Germanized the principal cities, are steadily carrying on the work of disintegration. Kottbus and Bautzen, at the north and south, are important railroad centres, and two new lines already in process of construction will pierce the remaining Slavic strongholds. The school, the church, the courts, and the militia being already in German hands, and the flat plains of the Spree offering no natural barrier to Teutonic invasion, the less than 150,000 Wends now distinguishable by their speech are very plainly destined to entire absorption.

DUMAS AND GOETHE.*

THE French have long been reproached with their ignorance of foreign languages and their indifference to foreign literatures, and their best friends have lately had no hesitation in telling them that it is high time they should mend their ways, and learn what is going on in those parts of the world which do not happen to be included in the Paris *banlieue*. It is a matter of life and death, say these wholesome advisers; their salvation depends upon it; and if five years ago the various Frenchmen responsible in their respective degrees for the security of their country had known a fiftieth part as much German as the corresponding personages in Germany knew French, Alsace and Lorraine might not at this day be enslaved to the masters of the former idiom. It would lead us too far to enquire why it is that, more than any other people in the world, the French have considered their speech and their writings as the normal tongue and the classic literature, and rather regarded the acquisition of English and German as an eccentric and superfluous accomplishment, but a degree removed from a curious attention to local dialects and vulgar variations. The fault is their neighbors' as well as their own; indeed, the fault may be brought home to a very occult historic cause. It has been the mingled blessing and bane of the French nation that it possesses a language which all the world has found it a pleasure to learn—an education, in a certain sense, to use—a piece of intellectual grossness not, in some degree or other, to have felt the influence of. For very many years this has been true, and it has not altogether ceased to be true at the present moment. But for a hundred reasons it is not so true as it was. We may say roughly, that so long as the refinements of civilization were of a tolerably simple order, there was very little that the French language was not capable of saying about them, and of saying better than any other. But of late the world has been getting to look very complex, and we hear a great many ideas buzzing away at our ears which answer, when addressed, neither to *Monsieur* nor to *Madame*. The French is not a large language; we have greatly loved it; we may claim even to have zealously *used* it, and we pretend to speak without prejudice. Its very charm and the secret of its long prosperity is its compactness, its convenience, the half-a-dozen virtues which it even now helps us out of our bungling by calling its *netteté*. On many points, for a long time, it seemed as much more civilized to express one's self in French rather than in English or German, as it seems to pay for an article in silver crowns rather than in eggs and chickens, in cattle and corn. These points are still standing, but other points have become visible all around them, which the silver crown, when applied, but insufficiently covers, so that we are obliged to have recourse to a larger coinage. Of course, to stretch our metaphor, the French are interested in insisting that the only wares worth owning are the wares their money will buy; for it is certainly not agreeable, in the supposed heyday of one's prosperity, to be left with a depreciated coinage on one's hands. For this we make large allowance, and we therefore note the more promptly all symptoms of an ungrudging attention to foreign markets, as we may say.

These remarks are suggested by the volume whose title we have transcribed—a volume noteworthy in both its aspects. It contains primarily a new translation of 'Faust,' more perfect, more adequate, its author affirms, than any of its predecessors. This is very possible; the translation strikes us as excellent, and it may fairly seem to its publishers a very proper *pièce de circonstance*. There was presumably a good deal of reading of Voltaire in the original beyond the Rhine before the events of 1870, and it is part of the humorous logic of history that there should be such reading as may be of

* 'Le Faust de Goethe. Traduction nouvelle, par H. Bacharach. Préface de M. Alexandre Dumas fils.' Paris: Michel Lévy. New York: F. W. Christern. 1873.

Goethe, in the best attainable translation, on the hither side of it at this late period, which is better than never at all. But what Michel Lévy & Co. count upon to sell their book, even more than the war of 1870, is the preface furnished to the volume by M. Alexandre Dumas fils. This gentleman's readers have of course observed that with the progress of events he has become more and more of a moralist. Every few months, for some time now, he has found himself with something edifying to say, and he has preached his little sermons with increasing gusto and skill. Every one has heard of the pamphlet on adultery in which the writer's wisdom seemed to have said its last word. This last word, it will be remembered, was *Tue-la !*—"Shoot her dead!" It made quiet thinkers jump, like a pistol-shot at the circus. But the seasons have revolved, and M. Dumas has arrived at new results. This time it is not the treacherous wife that we are to kill, but the author of 'Faust' whom we are to sit and behold ground into small, inanimate pieces before us. M. Dumas frankly confesses that he has never had a finer opportunity to hold his tongue. He is ignorant of the German language, and he comes after a host of commentators who had eluded this reproach. But his desire to paint a moral is irresistible, and he bravely embarks upon his theme.

M. Dumas is an excellent dramatist. There have been few greater pleasures for the theatre-goers of our time than to listen to the 'Demi-Monde' and the 'Question d'Argent.' These are considerable performances, and they imply in their author, in some points at least, a sound judgment and a lively imagination. They prove, certainly, that he knows how to present his ideas. His theory (very well stated in one of his prefaces), that in a drama every word uttered should *count* mathematically, here stands him in excellent stead, and makes him extremely readable. But apart from the presumption that there is something in M. Dumas's ideas, there is a great deal that holds one's attention in his sincerity. Evidently the various items of his philosophy are the result of no small amount of ardent emotion; he believes what he says, and he believes that a foolish generation which does not heed it will go to the bad all the faster for its indifference. For that we are going very directly to the bad, unless we radically amend our morals, is M. Dumas's intimate conviction. We are fatally fond of unclean things, and unless we pull up short in our reckless carnival, we shall find ourselves in the bottomless pit. M. Dumas should know, for he has made an especial study of the unclean; he has an infallible scent for it, and a singularly cunning hand in depicting it. He has apparently received his original impetus in his present undertaking from the discovery that there are a number of unclean things in the history of the author of 'Faust.' He begins his argument, however, by a vigorous plea for the diffusion of the masterpieces of foreign literature among his countrymen, and insists especially that the best works of the English and German stage ought to be occasionally represented at the Théâtre Français. He made the acquaintance of 'Faust' with a view to judging whether a literal translation of it might be successfully represented in Paris, but he was led to conclusions of a far larger scope. These were in great measure the result of a comparison between the poem and the poet's personal history, and they were flattering, on the whole, neither to the author nor to the man. Goethe, twenty years old, made near Strasbourg the acquaintance of a country parson's daughter; readers of his 'Autobiography' will remember the episode of Frederica. Goethe loved her, seduced her, left her, and carried away the germ of the story of *Margaret;* he loved again repeatedly, and M. Dumas counts off his successive sweethearts on his fingers with a critical commentary worthy of his best performances in this line; but he never loved with the same good faith; everything else was rank grossness; he had got his *Margaret*, his passport to posterity, and this was all he cared about. He began his poem, and wrote a bit here, and a bit there—having found his legend ready-made to his hand; but on the whole he got on rather lamely, and would very likely have hobbled along into utter oblivion, had not Schiller one fine day made his appearance—Schiller, who, like M. Dumas, could really serve you up a drama. Schiller set him, poetically, on his feet, prompted, suggested, invented, took charge of him intellectually, to the dénouement. But Schiller, unfortunately, could not last for ever; he died in harness, and left his friend with the second part of 'Faust' on his hands. What Goethe made of it shows us all that Schiller had done for the first part.

"Meanwhile, as death might grow tired of waiting till Goethe found the good (*le bien*), as his intellectual sense became weaker every day, according to the laws of nature, as the moral sense could not come to his assistance and Schiller could no longer advise him, as this poem, commenced with a cry of the heart, ought to have finished with a cry of the soul, as the heart had gone and the soul had never come, Goethe heaped up in his work episodes upon episodes, formulas upon formulas, symbols upon symbols. History, mythology, science, arts, politics, agriculture, industry, everything is summoned, everything comes in without connection, without reason. If Goethe were still living, he would be adding railway, the electric telegraph, chloroform, postal orders, and the *fumier impératif*. What fine verses he would use himself up in making about them all! For this labyrinth is enamelled here and there with charming bowers, where you pause to wipe your forehead; this low, opaque sky, which suffocates and asphyxiates you, is suddenly streaked with phosphorescent flashes which cross it and brighten it; but *'ce n'est pas le jour, ce n'est pas l'alouette';* they are nothing but spontaneous combustions of air, blue aerolites, which fall and are quenched in deserts of granite and oceans of lead."

M. Dumas gives us the second part of 'Faust' as it should have been, as surely, he declares, as two and two make four. We have no space for his ingenious synopsis, which culminates in the tableau of Faust presenting himself before the Lord, "holding with one hand Mephistopheles chained at his feet, with the other, Margaret, the eternal spouse, recovered and saved, leaning on his bosom. Humanity," the author adds, "will be thus represented as she is to be some day, after all her errors, revolts, and falls, victorious over evil, man redeemed by his conscience, woman redeemed by her love, making only one in a God integral, eternal, and infinite. This is the fatal, inevitable deduction which the idea contained in the first 'Faust,' imposed upon the second. Good or bad, there was no other, as there is no other solution than *four* to two multiplied by two." But the great Goethe was incapable of putting two and two together, having, in the first place, too little imagination, and, in the second, too little morality. That he lacked imagination sounds like a terrible heresy, but nothing is more obvious. He could conceive of no event without the warrant of a particular example; in order to conceive Faust seducing Margaret, he had first himself to seduce Frederica—in order to know that Werther would shoot himself, he had to wait two years, after first planning the tale, for Jerusalem to put a real bullet into a real pistol. He had, therefore, a very dull fancy. Morally, however, he was unfortunately none the better, as sometimes happens for this peculiar intellectual torpor. Into the history of Goethe's *mœurs* M. Dumas penetrates bravely, but we have no desire to follow him. They were as bad as bad could be; he was a very nasty fellow; he came near dying of vexation at seventy-four because a virtuous young lady would not listen to him; he ended his days, in short, as a *polisson vénérable*. M. Dumas touches these points with indescribable vivacity, and this whole phase of his subject elicits the choicest treasures of his wit. We especially recommend his account of Goethe's marriage and of his wife's eccentricities. As a *tirade*, it has really not elbow-room in the midst of the author's hard-pressing logic; uttered before the foot-lights at the Gymnase, it would bring down the house. M. Dumas, however, we suppose, is as free to expatiate on these matters in his own manner, and with his own object, as the poet's admirers have been to do so from the opposite point of view. They have to our mind usurped a much larger place in literary history than their merits entitle them to, and, offence for offence, we perhaps prefer M. Dumas's irony to the complaisance of friendlier critics. It is certainly more entertaining. Its purpose is to establish the position that Goethe was all of a piece, and that both in his life and writings he was criminally indifferent to *le bien*. But we may rest in peace, for God has already chastised him. He condemned 'Faust,' as a whole, to be a decidedly poor affair—a thing of intellectual shreds and patches, fluttering in every breath of criticism, and showing the daylight (or rather the inner darkness) at every rent; and he cut down the author's remaining literary baggage to a very light parcel indeed. After summing up his hero's infirmities—his poetic incompetence and his personal licentiousness, the terrible dulness and depravity of his second 'Faust,' and his going to bed with poultices and gruel on discovering that young ladies had ceased to find him irresistible—M. Dumas concludes:

"In short, of this strange tissue of errors, of faults, of researches, of egotism, of pride, of levity, of emotions, of weaknesses, of shadows, of lights, of science, of want of conscience, and of genius, there remains, with a few remarkable poems, two superior works, 'Werther' and 'Hermann and Dorothea,' and a masterpiece—the first 'Faust'—after sixty years of daily labor."

And then M. Dumas proceeds to remind us how the great poets of the Latin race have produced their masterpieces at a far faster rate, to declare that the great representative of the other race, "in its cold deduction, fragmentary, dusky genius, born of tenacious labor, of slow, mysterious, step-by-step progression, without original inspiration, without an ideal, without probity," may do very well for the humanity he so complacently embodies, "the mechanical humanity of functionaries and soldiers who believe that the world will accept their ideas, bear their yoke, and speak their language"; but that he, M. Dumas, speaking briefly, in the name of all Latinity, must give him, once for all, a piece of his mind. "Posterity will do her duty. She will write on her brazen tablets: 'Goethe, born at Frankfort, 1749; died at Weimar, 1832; great writer, great poet, great artist.' And, when the fanatics of form for form, of art for art, of love *quand même* and materialism, come and ask her to add 'Great man,' she will answer, 'No.'"

As far as proving a case and settling a question is concerned, M. Dumas's preface is of very small value. His acquaintance with Goethe is evidently of the slightest, and his judgment, even so far as it is based on his meagre information, is ludicrously perverted by national prejudice. The reader who is informed that the author of 'Faust' had no imagination, no intuition, we would recommend simply to read 'Faust' itself—even in the French translation which follows M. Dumas's essay, and which, in spite of its merit, is such a palpable underfit to the swelling, straining volume of the original; to read 'Wilhelm Meister,' 'Iphigenia,' 'Egmont,' 'Torquato Tasso'—works which M. Dumas has apparently not thought it worth his while to look into. Goethe certainly had an immense respect for reality, and no man was ever a greater collector and conservator, as one may say, of facts; but given the multifarious use he made of them—the mysterious music he drew from them—this was not a limitation but an extension of the poetic faculty. As for his having been or not been a *grand homme*, the question seems to us beside the mark, even from M. Dumas's point of view, and he reaches his conclusion by a perplexing *lapsus* in his argument. Very likely he was not; this would be our own impression; but M. Dumas ought to know that it is likely to be a waste of time to look for great men among prolific *littérateurs*. He ought, moreover, to have defined his term, and chosen near home an example of eminent moral virtue and eminent poetic genius. The real interest of his essay is, to our sense, quite an uncalculated one, and comes from our seeing a peculiarly Latin mind—or at least an intensely characteristic Gallic one—treating itself to a wholesome effusion of spleen against a peculiarly Germanic one. Our author's pamphlet has a really historic value. We do it injustice, moreover, by calling it splenetic; it is the voice of instinctive, deep-seated protest, dissent, and distaste, passing under the pressure of circumstances from the chronic to the acute form. M. Dumas, with his peculiar qualities and defects, is a happy mouthpiece for this dissenting voice. His mind is a very small one, but in its way it is very perfect; a larger mind, of the same stamp, would probably have found more points of contact in the author of 'Faust' than points of difference. How, indeed, was M. Dumas to endure Goethe for an hour? He seems to us to have been wonderfully patient, and to have handled him more gently than was to be expected. When the reader has followed our advice and refreshed his memory of 'Faust,' let him—we speak without the slightest intention of irony—go and read the 'Demi-Monde.' This clever drama will suffer, and yet it will not suffer. The reader will find it all form, compactness, roundness, smoothness, polish, art; but he will not find in it, without a rare amount of good will, a single word that echoes in the soul, that provokes the shadow of a reverie. "Faust" is another affair: it is slow reading for its very suggestiveness and intellectual resources. Of course, as M. Victor Hugo would say, the one hates the other; that is, when the one is in a greater hurry to hate than to understand. We may be sure that there are plenty of M. Dumas's fellow-thinkers who consider that he is making a rather indecent exposure of the Latin mind. And as for the "other," we suspect that if Goethe were living he would be at some pains to treat M. Dumas and his plays as one more *fact*—and a very entertaining one.

THE MAGAZINES FOR NOVEMBER.

AS commonly happens of late, by far the most noticeable of the magazine articles of the month is by Mr. Gideon Welles, who contributes it to the *Galaxy*. He this time tells a story, or rather a set of stories, about Mr. Seward, which will certainly astonish those friends of the late ex-Secretary of State who have been accustomed to take him at the valuation put upon him in Mr. Adams's "Memorial Address," although we suppose it will not very much surprise the majority of Mr. Seward's countrymen. They had formed already what appears to be a fair general estimate of his character and intellect, as, indeed, why should they not? having had him in full view for a lifetime, and the business being not so very difficult. But the prevailing opinion of Mr. Seward's officiousness, his lack of convictions, his not very exalted ambitions, and what must be called his trickiness, unless we choose to call it a hardened Albany politician's love of intrigue, these reminiscences of Mr. Welles's will greatly vivify. And they will as certainly, if not quite as greatly, vivify the popular sense of the sterling ability of President Lincoln, of whom it is apparent that Mr. Adams has formed an inadequate idea. Of Mr. Seward, at all events, he seems to have formed an opinion much too eulogistic, unless we are to regard Mr. Welles as an incompetent witness. This, however, it seems impossible that he should be in regard to most of the things which he narrates. Very dark days the article recalls; and we are made to see how readily they might have become disastrously darker, and how little of wisdom there was among our politicians and professional leaders. Here, for instance, we see General Scott vacillating between the policy of reinforcing Sumter and that of giving up both Sumter and Pickens, the one of which we never lost, the other of which we never could retake, and "letting the wayward sisters depart in peace." Still worse is our most celebrated New York statesman playing into the hands of the secessionists, imagining all the time that he is outwitting them, and prophesying a ninety days' war. Mr. Lincoln, too, though he evidently was quick to learn the lessons which he afterwards so well practised, is seen to have been in many respects ignorant and inexperienced, misled by bad counsellors, and at first insufficiently trustful of himself or watchful of his secretaries, some of whom he allowed undue powers and influence. And this last it might be as well for some of the more severe detractors from the merits of the "Memorial Address" to recollect. We have no space to speak at any length of the other articles in the November *Galaxy*. Mr. Richard Grant White's attack on Dr. Fitz-edward Hall shows an undiminished fondness for the effusion of blood, and persons unaccustomed to the odor of carnage had perhaps better go round it.

In the *Atlantic Monthly* the reader will find a pretty love-tale by Mr. E. H. House, which very nicely resets a due amount of the oldest of stories in Japanese scenery, with Japanese figures—all with an appearance of life-likeness. The Norse idyl, also, "Gunnar," continues agreeable, and in something of the same way with these two, that is, in its freshness and unwontedness, the last of Mr. Owen's autobiographic sketches is agreeable. Mr. Owen promises more if time and health permit, and more will no doubt be welcomed. For a long time, the magazines have had very few better serials than this, which, indeed, one can hardly think of as getting into print before the days of magazine serials, so well adapted is it for magazine readers, while in a book it might perhaps seem rather slight. "The Home Life of Salmon Portland Chase" is the title of a timely article, which is also readable enough. The best thing in it is a story about Mr. Lincoln, who once, in an important cabinet meeting, convened for the discussion of the Emancipation Proclamation, took out a copy of one of Artemus Ward's books and read a chapter of it aloud to his assembled counsellors, among whom was Mr. Chase, who said afterwards that at this little exhibition he quite lost patience at it. "Probably," says Mr. Chase's attentive biographer, "his disapproval was not unexpressed." Whether it was or not, Mr. Lincoln did not, we believe, abandon this method of amusing himself, for stories are told of his playing the same joke, long after the issuing of the Emancipation Proclamation, on a gentleman of a dignity and a lack of the sense of humor fully equal to Mr. Chase's—the joke, indeed, in these cases mainly consisting in the ponderousness of the gentleman who constituted the extremely astonished audience. Mr. W. M. Grosvenor writes the heavy article of the number, on the subject of the railroad companies, the farmers, the quarrel between them, and the bearings of the tariff on the question at issue. "Marjorie Daw," we see, has a poem addressed to her; and we presume a colossal statue, equestrian, is next in order.

In *Harper's*, the "Easy Chair" department resumes its original lustre, the first topic being the beauty and goodness of an Arcadia, which appears to be happily situate in some valleys and along some hills which lie anywhere between the Arcadia of the demos and that of the poets. This is followed by a discussion of duelling ethics, which is apropos of a certain ludicrous "affair of honor" which took place recently between two young New Yorkers. The Easy Chair first makes fun of this curious pair, and then offers its explanation of the theory of duelling as practised in modern times. It is an explanation which perhaps would hardly seem sufficient to a feudal gentleman endowed with feudal notions of honor, and thinking it no less than necessary to his personal dignity to disdain killing the enemy who had forfeited his life, without allowing him all the chance for preserving it that the caitiff might desire. But we suppose no fault will be found with it as a theory covering the New York or Yonkers or Titusville variety of duel.

Among the other papers in *Harper's* which will be found of interest are Mr. Moncure D. Conway's ("South Coast Saunterings in England"), which includes a pleasant description of Mr. Thomas Hollis, who so admired Milton, and who was a great benefactor of Harvard College; Dr. Maack's (an account, with a map, of Commander Selfridge's explorations, with a view to the cutting through the Isthmus of Darien); and Mr. Nordhoff's (a description of the Sacramento Valley). For the many who like "Porte Crayon's" sketches of the nook-and-corner people of his native region, there are several pages of illustrated matter much like what "Porte Crayon" was doing twenty years ago; and for the many men who like the *Harper* story of how he and she met and she loved him, and he professed to do the same, but deserted her, (it is Nannie McClean this time who fades away slowly, and the man is Seth Guile—a name only too appropriate), due and usual provision is made. A short story of a better kind, which, it must be admitted, has a hint of heart-break in it, but which has something else too, is contributed by Miss Ruth Dana. The awful singleness of purpose which marks the literary work of most ladies is in this little trifle decently and gracefully half concealed.

"A Friend of my Childhood," in the November *Lippincott's*, is a story told by himself about a small boy, a Philadelphian by birth and residence, who, being engaged in ringing his mother's door-bell for twenty minutes by the clock without cessation, was surveyed the while by a tall gentleman, who seemed much interested in his young friend's crime, and who afterwards, when at last the two were admitted into the house, demanded an introduction to the youth. The tall gentleman turns out to have been Mr. Thackeray, who, on a subsequent occasion, "tipped" the bell-ringer with a sovereign.

The *Lippincott* serials (Mr. Black's story and Mr. Strahan's fantasy, "The New Hyperion") go on successfully, and so do Mrs. Feudge's Eastern sketches. Of the single articles there will be found readable some verses by Miss Emma Lazarus, of which the interest is partly personal, and a critical article, quite generous enough in its praise, on the little-known author of 'Death's Jest-Book,' Mr. Thomas Lovell Beddoes. He was one of the poets who have the capacity for so far saturating themselves with the life of a particular bygone time—or rather, of course, with some particular extract from the life of some particular time—as to lose almost all natural flavor of their own. This makes them rare men and interesting; but the process certainly does not turn them into Greeks, for example, if that is what they wish to be, nor mediævalists, nor Orientals; and it perhaps hinders them about as much as it helps them in expressing what poetry of their own is in them. Thus, one of them will write an Elizabethan lyric with one Tennysonian line in it, which shall be of excellent skill yet a perfect failure, and the probability would seem to be that a lyric of his own he could have made. Beddoes wished to be a mediæval, and as his imagination loved the grisly and grotesque, it is not the ordinary gloomy or cheerful or superficially picturesque modern mediæval things that he deals in—the knight and the foot-page, and the rosy monk and the ascetic monk, and the like, but rather in a sort of mediæval life made up, as it were, of all of grotesque and of naïvely horrible that ever suggested itself to the fancies of the artists of those ages of faith, of credulity, of violence, and of spiritual gloom. The scene is bewildering; and the author's apparent unwillingness to do more than adumbrate his plot, and his apparent incapacity—indeed, his confessed incapacity—to produce a character at all, make his tragedies strange reading. Withal, there is no want of intellectual vigor in detached passages, although the poetry leaves upon one the impression of having been produced by a man of an enormous, even diseased, energy of will, out of all proportion to the intellect which tried to guide it, and which was impelled by the will to action. The result of the contest going on in the man seems to have been an embittering of the poet, whose force expended itself in rather furious dramas, with many confused beauties interspersed with sweet quaint lyrics, but the general effect of which reminds one of a wild old tapestry, say, or a faded Dance of Death.

Scribner's Monthly begins with this number a new volume, and it wears a very prosperous and enterprising look. *Hours at Home* and *Putnam's*, the one with its quiet back-parlor ways, and the other with its souvenirs of the Bowling Green and the Livingston Manors up the river, would hardly recognize themselves in their devourer and successor, with its panorama of the New South, which opens this month with a long article on Old and New Louisiana, by Mr. Edward King, who is an industrious correspondent, and who is assisted in his work by a tolerable artist; with its serial contributions all the way from England, and written by "the greatest of living English historians"; and with its poems from remote Boston and Cambridge, its novels and novelettes, brought from across the sea and even from regions south of Philadelphia at home. One American magazine as well calculated as *Scribner's* to be popular in a community like that of which New York is the business centre it would, we suppose, be possible to find, but doubtless not two.

In 1864, Mr. Clarence King made an unsuccessful attempt to reach the summit of Mount Whitney, in the Sierra Nevada, from the southern side. In 1871, he renewed the attempt from the eastern side—as he supposed on the same mountain, trusting to the location assigned to it in the meantime by some of his associates in the Geological Survey. According to an article in the *Overland Monthly* for November, by Mr. King's colleague, Mr. James D. Hague, it now turns out that the peak which has hitherto borne the name of Mount Whitney is really six miles distant from the true and loftier one; and that the error was only discovered last July. Mr. King has since enjoyed the pleasure of a complete ascent, and his and some previous measurements agree in making out Mount Whitney to be at least 15,000 feet high, and the highest known point in the United States.

BOOKS OF THE WEEK.

Authors.—Titles.	*Publishers.—Prices.*	
Abbott (Rev. J. S. C.), Peter Stuyvesant	(Dodd & Mead)	$1 50
A Great Lady: A Tale	(J. B. Lippincott & Co.)	
Against the Stream: A Tale	(Dodd & Mead)	$1 75
Birks (T. R.), First Principles of Moral Science	(Macmillan & Co.)	3 00
Burton (J. H.), History of Scotland, Vols. 6 and 7 (Scribner, Welford & Armstrong)		3 75
Bain (A.), Mind and Body	(D. Appleton & Co.)	
Beecher (Rev. H. W.), Yale Lectures on Preaching	(J. B. Ford & Co.)	1 50
Benedict (F. L.), Miss Dorothy's Charge	(Harper & Bros.)

PUBLISHED THIS DAY.

RECENT MUSIC AND MUSICIANS, as described in the Diaries and Correspondence of Ignaz Moscheles. Selected by his wife, and adapted from the original German by A. D. Coleridge. 12mo, cloth, $2.

"Not only musical enthusiasts, but every one who has the faintest glimmer of a love for music and art, will welcome with delight this volume."—*London Examiner.*

"A valuable book of reference for the musical historian, for the contents extend over a period of threescore years, commencing with 1794 and ending at 1870. Moscheles writes fairly of what is called the 'Music of the Future' and its disciples, and his judgments on Herr Wagner, Dr. Liszt, Rubinstein, Dr. Von Bülow, Litolff, etc., whether as composers or executants, are in a liberal spirit. The volume is full of amusing anecdotes."—*Athenæum.*

"Full of pleasant gossip. The diary and letters between them contain notices and criticisms on almost every musical celebrity of the last half-century."—*Pall Mall Gazette.*

HAMMER AND ANVIL. By F. Spielhagen. Household edition. 16mo, uniform with 'Problematic Characters' and 'Through Night to Light,' $1 50.

"We have no hesitation in pronouncing 'Hammer and Anvil' one of the greatest master-works of fiction in any language of late years."—*Evening Mail.*

"Everywhere one traces the hand of a master, and this work alone would be for any man a title to enduring fame."—*Liberal Christian.*

(late Holt & Williams), New York.

HARPER'S CATALOGUE. The attention of those designing to form libraries, or increase their Literary Collections, is respectfully invited to Harper's Catalogue, which comprises a large proportion of the standard and most esteemed works in English Literature—*comprehending over three thousand volumes.*

Librarians, who may not have access to a trustworthy guide in forming the true estimate of literary productions, will find this Catalogue especially valuable for reference.

The Catalogue is arranged alphabetically by the authors' names, anonymous works by their titles. The index is arranged by the titles of the books, besides having numerous appropriate heads, each general head being followed by the titles of all works on that subject.

Harper's Catalogue sent by mail on receipt of six cents.

Address HARPER & BROTHERS,
Franklin Square, New York.

NEW AND OLD BOOKS. Priced Catalogue No. 29, for September (containing many CURIOUS and RARE WORKS not often met with), forwarded free to any address.

DAVID G. FRANCIS,
DEALER IN NEW AND OLD BOOKS,
17 Astor Place, New York.

DEAN HOWSON'S NEW BOOK.

THE CHARACTER OF ST. PAUL. Being the Hulsean Lectures for 1862. By J. S. Howson, D.D., joint author of Conybeare and Howson's 'St. Paul.' 12mo, $1 75.

CONTENTS.

I. Tact and Presence of Mind.
II. Tenderness and Sympathy.
III. Conscientiousness and Integrity.
IV. Thanksgiving and Prayer.
V. Courage and Perseverance.

THE WEEK IN TRADE AND FINANCE.

NEW YORK, Oct. 27, 1873.

THE situation continues to improve as regards the financial condition of the banks, and everything points towards a general resumption of currency payments by the 1st of November. The Cincinnati banks resumed payment week before last; the St. Louis banks have voted to resume to-day, while the Chicago banks, as a rule, have been paying out currency right along, no formal or general suspension having taken place among the banks of that city during the recent panic, nor did they avail themselves of the plan, adopted in New York and other cities, of issuing loan certificates as a medium of settling their indebtedness at the Clearing-House.

The banks in this city gained largely in legal tenders every day last week, and the strength of the different institutions has evidently so far improved as to warrant a discontinuance of the "pooling" of legal tenders after the 1st of November, a vote of the bank managers having so decided. The premium on legal tenders and national-bank currency is only nominal, the quotation remaining at ⅛ of 1 per cent. all the week, and the banks have been very willing to supply their customers who want them for legitimate uses, such as paying wages, etc. It is to be hoped that with the resumption of currency payments by the banks, the savings-banks will see fit to set afloat a greater portion of their hoardings, and act as if they had some little confidence left after their frightful scare of the last month.

President Grant has written a letter to Mr. John E. Williams, President of the Metropolitan Bank, and has had a conversation with Mr. Anthony, a merchant of this city, by whom he forwarded the letter to Mr. Williams. The letter to Mr. Williams advises the banks to help the merchants, and states that the Government will assist the banks by every means in its power. It seems that Mr. Anthony, in his conversation with the President, understood the latter to say that the Government would issue from $3,000,000 to $4,000,000 a week of the "$44,000,000 reserve" for a number of weeks to come; but this is denied by both the President and the Secretary of the Treasury, who disclaim any intention of making further issues of currency beyond the absolute requirements for the current expenses of the Government, and even then the issue is only to be of a temporary character, and to be withdrawn as rapidly as possible.

Affairs at the Union Trust Company show some improvment. The loan of $1,750,000 to the Lake Shore and Michigan Southern Railroad Company has been provided for by Commodore Vanderbilt, who agrees to give his notes, running three, six, and nine months, secured by Harlem Railroad stock at 90, for the entire amount of the railroad company's indebtedness. As soon as these notes can be sold and the money obtained, there will, it is said, be no further difficulty in the resumption of business by the Trust Company.

The range of rates on call loans has been between 7 per cent. and $\frac{1}{32}$ commission added. Borrowers have had little difficulty in supplying themselves at the legal rate, while a considerable "short interest" in the stock market has enabled brokers to lend their stocks, receiving the currency value therefrom at still lower rates.

The market for commercial paper has been more active, but the rates remain at about those last quoted—15 to 18 per cent. for the best class of names.

Foreign advices are more favorable than those of last week led us to expect. The Bank of England rate of discount remains at 7 per cent., although the Bank continues to lose in bullion, £287,000 having been withdrawn last week.

The stock market remained in its feverish and unsettled condition until Friday, when the announcement was made by a morning paper that some $2,250,000 bonds of the Lake Shore Road had been issued to the Executive Committee of the road, consisting of three of its directors, and by them hypothecated with George B. Grinnell & Company as security for advances made to them on a speculative joint account in that firm's office. Upon this there was a rush to sell Lake Shore and other Vanderbilt stocks, and, as a consequence, a heavy decline took place in them, Lake Shore selling down to 61. The general market shared in the decline of the Vanderbilt stocks; but later in the day, by vigorous buying on the part of Vanderbilt, the price of Lake Shore was carried up to 65, at which figure it closed. On Saturday, owing to unfavorable rumors in regard to certain large holders of stocks, the market became weak, and continued so until late in the day, when another break took place in prices, owing, it is said, to the selling out of large blocks of stock, which had been pledged as collaterals in time loans, and which the holders refused to renew. These securities, it is said, belong to the at present unfortunate "Vanderbilt party," and the decline which followed was greatest in those stocks understood to be the special favorites of the Commodore. The following will show the extent of the break:

	Opening.	Highest.	Lowest.	Closing.
N. Y. C. & H. R.	89¾	89¾	85¾	86 bid.
Harlem	107	108	105	104½ "
Erie	46⅛	46¼	45¾	45⅝ "
Lake Shore	65	65¼	60⅜	61¼ "
Wabash	40⅜	41⅜	37½	37¾ "
Northwestern	36¾	36⅞	33	33¾ "
Rock Island	91⅜	91⅞	87½	87½ "
Mil. and St. Paul	29¼	29½	25	25¼ "
Ohio and Miss.	23¼	24⅛	22¼	22¼ "
Union Pacific	17⅜	17¾	16⅜	16¾ "
Western Union	56½	57¾	51¾	51¾ "
Pacific Mail	32¼	32⅝	30½	30⅝ "

The *Financier* of October 25 contains the following statement of the settlement of the late difficulties between Mr. W. B. Stockwell, former President of the Pacific Mail S. S. Co., and that Company:

"The Company claimed an indebtedness of $840,000 for stock sold by him, and Mr. Stockwell gave his notes for $100,000 each, to mature, one at the beginning of each month, until the entire debt was paid. As security for the payment of the notes, he also gave a mortgage for $840,000 upon the Howe Sewing-machine property at Bridgeport, Conn., which the Pacific Mail Company accepted as collateral. The notes, as they fell due, were not paid, and in this way the stock was made to suffer at the hands of the 'bears,' who used these untoward circumstances to depress the price. At first it was supposed that the mortgage upon the Bridgeport property was valid; but it was finally discovered that it would not hold good, and that the Pacific Mail Company stood a fine chance of going without their money for a long time. Besides this, money was needed for the purchase of new steamers, which were necessary to carry on the business of the Company, and a loan was negotiated from the Panama Railroad of $500,000. Mr. Stockwell is President of the Panama Railroad Company, and it is understood that his influence in the negotiation of the loan to Pacific Mail counted as something in the final settlement. Mr. Stockwell, some time ago, claimed that the Pacific Mail Company owed him $1,000,000, and brought a suit as an offset to the one against him. The entire matter was settled by an agreement on Mr. Stockwell's part to hand over 10,000 shares of Pacific Mail to the Company, the entire number of shares to be paid in monthly instalments, running through a period of seven months. The Company, in consideration of this number of shares of its own stock, agrees to give Mr. Stockwell a full release from all obligations, and Mr. Stockwell gives the Company a release from any obligations which he claims are due to him. The notes and mortgage are to be kept in the possession of the Company until Mr. Stockwell has completed the delivery of the 10,000 shares of stock. Out of the $840,000 which the directors of Pacific Mail claimed that Mr. Stockwell owed them, about $35,000 have been already received, so that the total indebtedness which he was called upon to liquidate was $805,000. The stock closed yesterday at 33, thus making the total amount which Mr. Stockwell has settled for $330,000, and leaving $475,000, which has been 'thrown' off in the bargaining."

The following shows the highest and lowest sales of the leading stocks at the Stock Exchange for the week ending October 26:

	Monday.		Tuesday.		Wed'day.		Thursday		Friday.		Saturday		Sales.
N. Y. C. & H. R.	88¼	90½	88¾	89¾	89	90½	89¼	90½	88	89	85¾	89¾	76 300

The market for Government bonds shows decided improvement. It was evident from the class of bonds most in demand during the latter part of the week that the buyers consisted largely of those who had been sellers during the commencement of the panic. In the absence of any demand, the market had greatly fallen off, even though the amount of bonds pressing for sale was small; now, with a good demand from savings-banks and others, it is quite as difficult to fill orders to buy without running up the price as it was before to sell without depressing it.

The gold market has been very dull, with quotations materially unchanged. The present condition of the market is attributable to the entire absence of speculative support, and the fact that merchants in need of gold with which to pay duties at the Custom-house, and buy exchange, purchase only the amount absolutely required; and, owing to the unsettled condition of mercantile affairs and the difficulty of obtaining money, these purchases are considerably under what their ordinary wants would require. The range of quotations has been between 108⅛ and 108¾, and the closing price on Saturday was 108½ to 108⅝.

The total shipments from England to this country since the panic commenced amount to nearly $13,000,000 thus far.

The total exports of specie from this port since January 1, 1873, amount to $43,742,140, against $60,860,371 for a corresponding period in 1872, $57,319,380 in 1871, $51,242,749 in 1870, and $28,393,797 in 1869.

The Nation.

NEW YORK, THURSDAY, NOVEMBER 6, 1873.

The Week.

THE failure, on Thursday, of Hoyt, Sprague & Co., agents of the A. & W. Sprague Manufacturing Co. of Rhode Island, had a depressing effect on Wall Street, which was not allayed by the subsequent reports of the difficulties of the Spragues themselves. The Spragues are commonly spoken of, and perhaps consider themselves, as ordinary manufacturers, but their enormous importance in the financial world is easily appreciated when we consider the fact that, while the liabilities of the State of Rhode Island, in which they do their business, are in round numbers some $6,000,000, or, including the town and city debts, $9,000,000, the liabilities of the Spragues are $11,000,000; in reality, the effect on business of disaster to such a firm would be far greater than complete bankruptcy on the part of the State. Their affairs being investigated by a committee of the local banks, it was found that their assets exceeded their liabilities by $8,000,000, and they have undertaken to put all their affairs, including their private property, in the hands of trustees, to be administered for the benefit of all concerned. Rumors were industriously circulated about H. B. Claflin & Co., and they were supposed to be in need of assistance from the banks, but what they needed they obtained privately. The disclosure of the condition of the affairs of the Spragues and the ease with which H. B. Claflin & Co. extricated themselves from their difficulties, had a very reassuring effect.

It may be worth while, in view of the present unsettled condition of the public mind, to call attention to the fact that a panic once in ten years or twenty is really all that a country is fairly entitled to, and that the present effort on the part of some enterprising newspapers to give us panics at the rate of one a week, though well meant, is misdirected. The panic of 1873 is now over, and the depression of business which has ensued is nothing more than what inevitably follows on the track of all panics. The condition of the banks shows that the panic proper is over, as they have already resumed currency payments, and have in their vaults a supply of greenbacks three or four times as large as it was on the 20th of September, and a supply, too, which is constantly increasing. The Washington correspondents telegraph to New York that inflation is on the cards as soon as Congress meets, but inflation would do no good now. The only time when inflation could have been of any use was when the President and Secretary Richardson were masquerading at the Fifth Avenue Hotel in the interest of law and the Constitution.

Indeed, the condition of the public mind recalls a story of the riots in 1863. While the disturbances were at their height, a single rough stopped an omnibus filled with male passengers, swore at them, and told them to get out, which they did promptly. When they were huddled together on the pavement, he again swore at them and told them to get in, which they did with equal promptness, and the omnibus then drove off, leaving him grinning at his success. The "moneyed mind of the community," to use a phrase we once heard at a financial meeting, seems to be in a state of nervous alarm that would disgrace the intellectual apparatus of an old woman. A certain number of operators, adventurers, quacks, and "bears" seem to occupy themselves just now with the invention of alarming stories of failures, which the newspapers, for convenience' sake, have divided into "malignant rumors" and "disquieting rumors." They are produced by the dozen every day, and there appears to be a large body of persons so easily affected by them that on hearing one they rush out and begin selling off their property to the highest bidder; this is really what occurs when we are told that "stocks grew weaker under the influence of a report" that Mr. A. T. Stewart's dinner had disagreed with him, or that Vanderbilt had overdrawn his account. Of course some of these rumors have a strong tendency to produce the occurrences which they profess to describe. Every man in business is just now short of money; many have to borrow who are as solvent as the United States. All that is often needed, however, to prevent their borrowing, and ensure their failure, is to spread a report that they are going to fail. No panic could come to an end unless the more influential portion of the financial world determined to cheer up and go about its business in the ordinary way. The first step towards a rally, in all panics, is to stop running, and leave off taking distant pigs for cavalry and the rumbling of cart-wheels for artillery.

General or partial elections were held on Tuesday in this State, and in Massachusetts, New Jersey, Maryland, Virginia, Mississippi, Arkansas, Illinois, Wisconsin, Minnesota, Michigan, Kansas, and Texas. In general, a light vote was expected, as it well might be. The full returns show, for instance, that in Pennsylvania, last month, one voter in every three staid at home on election day, and in some counties, as Indiana and Allegheny, the proportion was one in two. But Tuesday's vote was not expected to be light everywhere. In Virginia, the gubernatorial term is four years; a United States senatorship, with many aspirants, was among the prizes; and, more than all, it was felt that the so-called carpet-baggers would this year make one of their bitterest fights, and perhaps their very last one, for the control of the State. The line was very sharply drawn between the whites and the blacks, so that it is hardly an exaggeration to say that it was a struggle of races. All the old cries were heard. The negroes were reminded that the Conservatives once held them in slavery, and sold their families down South; and these references were met by Conservative references to the ravishing of an aged lady by two of Kellogg's colored policemen. "It seems monstrous," says the Lynchburg *Republican*, "to suppose that any white man, having a mother, sister, wife, or daughter, can march up to the polls and vote to place in power a party which connives and smiles at such outrages." Saner references were made on every stump to the disordered finances and outraged statute-books of Louisiana and South Carolina under the unfettered control of main strength and ignorance. In the Northwestern agricultural States some interest was lent to the result by the presence of the "anti-monopolist" element, and in Mississippi the Butlerite wing of the Administration Republicans was led by young Senator Ames, who was opposed by Senator Alcorn, a native Mississippian and an independent man. The Democrats aided him by setting up no candidates of their own. Rumor has freely asserted that Ames's success would mean a revival of the famous old repudiated Mississippi bonds, some millions of which are asserted to be in good hands.

What has been the result of the election, so far as Mississippi is concerned, is not known as we write; but there as elsewhere the Administration Republicans appear to have undergone very well-earned reverses. In Massachusetts, what with the freest sort of scratching, and a strong anti-prohibition feeling in the cities—where, moreover, angry Butlerism was strong—Governor Washburn's majority on a very light vote was cut down from more than seventy thousand to something not far from twelve thousand—a most extraordinary Republican majority for Massachusetts. Evidently these are not the days of "Free Soil, Free Press, Free Speech, Fremont." Among the minor but noteworthy incidents of the contest in Massachusetts is the election of General N. P. Banks to the State Senate. His opponent was a Mr. Copeland, a completely representative Butler man, whose caucus-packing and

other small arts enabled him to carry off the regular nomination, but so enraged his opponents that they adopted the project of setting up General Banks as an independent candidate. It is neither flattery nor praise of General Banks to say that he is the better man of the two—though we little thought ever to be pleased by his return into political life. In Virginia, the Conservatives win a very decisive victory. Their majority is estimated at twenty thousand and upwards, and this although a month or so ago the Administration party were pointing to a majority for Grant last autumn, and talking of carrying the State. The truth is, however, that a great many things have happened since last autumn. In Wisconsin there is actually an anti-Republican and "anti-monopolist" majority, which is set at about five thousand. The majority last year was on the other side, and was more than eighteen thousand. In this State, where the Democrats more fully than anywhere else reaped the benefit of the disgust engendered by the financial crisis, the attempt to save the Republicans by Custom-house and Apollo-Hall alliances failed disastrously, and the Fentonite members of the party have the satisfaction of seeing the Conklingite faction enduring a worse beating than any they themselves ever contrived to get. The constitutional amendment, ordering that judges be appointed and not elected, was, we are sorry to say, lost. It would seem that the people outside the city are satisfied with their judges; that they have a natural inclination to keep in their own hands such power as they find lodged there; and that the politician class, of whatever party, were as one man against the proposed reform, and used all the party machinery against it. So far as now appears, the Assembly and Senate are still to be controlled by the Republicans. On the whole, looking at the general results of this autumn's contest, we suppose it is the politicians who will mostly regret the results. Such honest and sensible men as are not strongly partisan will not be sorry that there has been a turn in what had become an extremely dirty as it long had been an extremely strong tide.

The Senate Transportation Committee has held another meeting at St. Louis. It seems, from the report of the proceedings, that the solution of the farmers' difficulties suggested at their Chicago Convention, of "holding back their hogs till they could get five dollars for them," is not generally satisfactory. Mr. Flagg, President of the State Farmers' Association of Illinois, having presented a report on behalf of the Chicago Convention, was followed by Mr. S. F. Tufts, editor of the Centralia *Democrat*, who "descended into the valleys and brought up some further truths," which were cordially endorsed by Mr. Flagg. Mr. Tufts, among other things, suggested that a maximum rate should be established by Congress of three cents a mile for first-class passenger trains, and a maximum rate for freight which should secure a "just and reasonable" return on the capital invested, and also recommended the consideration of the propriety of enacting a law excluding from Congress any one interested in any way, directly or indirectly, in the construction or operation of any commercial thoroughfare. On being asked what he would do if Congress altered the railroad law and the change was declared unconstitutional by the Supreme Court, he replied that he would "wipe out the Supreme Court." What we wish to call attention to is that this mad talk is "endorsed" by a prominent official—perhaps the most prominent official—connected with the farmers' movement.

The *Tribune's* Grange correspondent has been giving a curious account of the life and opinions of a farmer named Stillson, a leading Wisconsin yeoman. When Mr. Stillson settled, some years ago, in Wisconsin, he was not rich; his lands were "plastered all over" with mortgages bearing a very high rate of interest. He has however raised himself from this condition to that of one of the wealthiest men in the State. His acres are numbered by thousands (one farm is mentioned containing 960 acres), he has 150 head of cattle and horses, and between 1,700 and 1,800 head of sheep. He is not a member of the Grange, but he looks with favor upon the farmers' movement. He is a Democrat and a protectionist. In short, this typical Wisconsin husbandman is in every respect the opposite of the picture presented to the popular mind by the agitators as the true representation. Far from being a poor man, he is a large capitalist; instead of being a discontented Republican, he is a Democrat; instead of feeling himself oppressed by the tariff, he feels whenever he looks at his sheep or thinks of the year's clip of 7,000 pounds of wool, how wise and just are the arrangements of Congress. Most of the farmers, this correspondent says, know and care very little about the tariff. The Grange organizations have, however, been found of great use in lowering prices through co-operative purchases.

The Stokes trial has resulted in a verdict of manslaughter in the third degree, and a sentence of four years at Sing Sing. The result cannot be said to have been received with either delight or regret by the public, who had already begun to lose their interest in the case. Those who have read the reports of the trial will be inclined to wonder whether or no there is any one who has any jurisdiction over the morals and manners of the members of the Bar. During the trial, one of the counsel accused another, almost in so many words, of "lying and knowing that he lied," throwing out at the same time broad hints as to the looseness of his opponent's private character, and insinuating that it was a piece of great hypocrisy for a man so depraved to appear in the case at all. As long as the judges never disbar anybody, and the Bar Association never expels anybody, this Billingsgate practice will continue.

Several States have laws on their statute-books requiring the courts to appoint supervisors of election, for the purpose of preventing fraud. As a general rule, these laws have not had much effect, except to drag the judiciary a little lower down in the mire; and the Massachusetts Supreme Court has now rendered a decision declaring such a law—passed by the last Massachusetts Legislature—unconstitutional, on the ground that it confuses the boundaries between the judicial and executive departments. This very sound decision, indicating as it does the revival of "tone" in the Court, and coming so soon after the defeat of Butler, is received by all Massachusetts reformers as an encouraging sign. In addition to this, the establishment of a Boston Fire Commission has been voted by both branches of the City Government. This change is the first important improvement which the conflagrations of the past three years have occasioned. Elsewhere, as in Chicago, there has been a great deal of talk, but nothing done. Some of the names of the gentlemen mentioned in connection with the newly created commission are almost too good to be true. To cap the climax, the old Hartford and Erie swindlers are being sued right and left, and along with them our great international jurist, J. C. Bancroft Davis. Mr. Davis was trustee for the bondholders of the road, and received from the Eldridge gang some $60,000, as a consideration, it is alleged, for corrupt neglect of his duties.

The Philadelphia Ring—probably the most audacious body of corruptionists in the world—may turn out to have received very unexpectedly a most damaging blow. The State Constitutional Convention has been the butt of the ridicule of these men ever since it began its sessions. They openly said that they would defeat its amendments looking toward reform by 50,000 majority, and "more if necessary"—the most insolent notification that Philadelphians had then received of the power of the ring, though since then another has been given them in the majorities accorded by the counters to Judge Gordon and the tainted Mackey respectively. The Convention paid no attention to the threats of the ring until the last day of October, when it had completed its chief work and arrived at the making of an ordinance which should provide for the method of voting on the new constitution. After making provision for the

counties in general, a special clause was reported for Philadelphia, where there is now in existence a special law governing elections—a law under which the falsifying of the returns has of late years been done, and done easily. The special clause named three Republicans and two Democrats as Commissioners to revise the registry, appoint election officers, and receive, count, and certify the votes of the city. The Philadelphia delegation in the Convention was at once in alarm, declared that there never had been any repeating done in the city, that the ordinance was an insult to Philadelphia, and so on; but out of a total vote of 113 in the Convention, but fifteen men were found to vote against the special clause. Should this ordinance stand, Philadelphia will vote to accept the new Constitution and it will become the fundamental law, "the infamous registration law" will disappear, and momentarily at least the citizens will have their city in their own hands. But it is stated that an appeal will be made to Governor Hartranft to issue his proclamation declaring that this same registration law is the law under which the election in Philadelphia must be carried on. It can hardly be believed that he will venture on this. The confession would be too open for one man to make and take the responsibility of, though the ring would not hesitate an instant. And in any case, what a confession it is for Pennsylvanians to listen to that is made by their Convention's ordinance.

The efforts of the Legitimist delegation to bring the Comte de Chambord to reason have, it is now announced, totally failed. He has written a letter, and insisted on its publication, in which he declares in substance that anybody who supposed that he was capable of entering into a compromise of any kind on any subject was greatly mistaken; that he would not concede anything to the spirit of the age; and that, in short, France must take him, if at all, just as he was, and that it was through him only that she could be saved. The letter has raised him in people's estimation morally, but has damned him as a politician, and has almost reduced the Monarchists to despair. They still maintain stoutly, however, that they have got the requisite majority in the Assembly, and they treat any indications that the tide of feeling is running against them as so many proofs that they must by hook or by crook save the country from Radicalism. MacMahon evidently sympathizes with them, and yet behaves with extraordinary discretion and reticence. He helps the Legitimists, however, in the old way, by suspending Republican newspapers, and by postponing the elections to fill vacancies to the utmost legal limit—six months. The *Siècle* is now under the ban for reporting a speech of Gambetta's. The Marshal's military reputation, by the way, has been considerably raised by the last volume of the German official history of the war, which describes his retreat after Forbach as a masterpiece of strategy, and confesses frankly that he defeated Moltke's calculations, and got off so cleanly and deftly that not only did Prince Frederic Charles fail to cut him off as ordered, but the flower of the German cavalry failed even to "feel" him.

The quarrel between the Catholic prelates and the crown in Prussia has entered on a new phase. Archbishop Ledochovski continues so contumacious that the Government proposes to have him dismissed by the new ecclesiastical court, and the Old-Catholic Bishop Reinkens of the same diocese put in, in his stead, as the only lawful bishop of the diocese, and therefore the only one authorized to receive official communications from the Pope. Should Ledochovski continue to officiate after his deposition, it is considered probable that the Government will procure legislation at the next session of Parliament empowering it to imprison in all such cases. The official paper charges the whole of the Prussian Catholic prelates with "disobedience, resistance, and rebellion."

King John of Saxony, who died last week in his seventy-third year, was something more than a mere king. He was a man of delicate temperament, refined taste, and studious disposition. The trade of royalty was not suited to him, and his reign, which began in 1854, when he unexpectedly succeeded his brother, was full of personal and political trials and reverses. In the struggle between Austria and Prussia his sympathies and his hopes led him to take part with the losing side. His kingdom virtually lost its independence; his own authority and influence as a ruler were greatly diminished, and he was forced to accept conditions which he could not but keenly feel as humiliating to himself and his family. Saxony in becoming a subordinate portion of the German Empire lost little that was worth preserving, but the lustre departed from her court, and her rulers lost all but the shadow of kingship. King John accommodated himself to the change of position with dignity and manliness. He made no useless resistance to force that he could not withstand, and he found support under his calamities in religion and in his favorite studies. His qualities were not such as to awaken an enthusiastic devotion toward him in his people, but he secured from them the respect he deserved. Of his rank and services as a scholar we have spoken in another place. He is succeeded by a son who does not inherit his literary tastes, but is said to be a respectable soldier. He won some reputation at the head of a corps in the Franco-German war; but in the case of princes it is difficult to apportion the credit due to them individually, and that due to their staff and subordinates. A prince wins credit easily.

The most striking phase, in an historic point of view, of the conflict between the Syllabus and modern civilization, has been the recent correspondence between the Pope and the Emperor William. It is not so very recent after all, for the Pope's letter bears date of August 7; but the Emperor waited before replying till all his ministers had returned to celebrate the victory of Sedan. The next day, September 3, the reply was despatched, and at the same time the diploma of the Old-Catholic Bishop Reinkens was issued. The publication of both letters was withheld till the eve of the elections in Germany, and two days later the Emperor became the guest of the Emperor of Austria. The Pope's letter, regarded as a serious attempt to influence the august personage to whom it was addressed, or to conciliate his subjects, is an inspired production. He suggests that the Emperor disapproves of the Catholic persecutions instituted by his own Government; tells him they are endangering his throne; and says he speaks frankly because "all who have received baptism"—even non-Catholics—"belong to the Pope." The Emperor's reply is very vigorous. He reminds the Holy Father that all Government measures in Prussia are subject to the royal approval; informs him of the clerical organization to disturb the peace of the state; and hopes that this news will induce him to exert his authority to put an end to this agitation, which has nothing to do with the religion of Jesus Christ nor with the truth—"the truth is my banner," the Pope had said. As for "belonging" to the Pope because he had been baptized, the Emperor calls attention to the Evangelical faith which he professes, in common with the majority of his subjects, and which admits no mediator save Christ between them and their Maker, though it "does not prevent them from living in peace" with those who do not share that faith.

This, as has been remarked, is the first time in modern history that an Emperor of Germany, writing to the Pope, has been able and, in fact, constrained to tell him that he does not belong to the Church of which the latter is the visible head. A trifling incident which has since taken place in Rome marks, in a manner scarcely less forcible, the immense gulf between the past and the present of the Papacy. One Grassi, canon of the basilica of Santa Maria Maggiore, some time in September withdrew from his office, abjured the Catholic religion, and turned Protestant. This made some stir in Rome, and sent the chapter of Santa Maria Maggiore, with an humble address, to the Pope, openly deploring the scandal and protesting its own fidelity. Somewhat later, Grassi was summoned to appear before the Tribunal of the Inquisition, and, this name not having lost all the terror of its associations, he at first refused to attend. On reflection, he concluded he had nothing to fear for his personal safety, and voluntarily presented himself. He was gratified to find no flummery, no horrid paraphernalia, no tortures. After a few formalities, he was dismissed to go about his business.

THE PRESS AND THE PRESENT CRISIS.

MR. A. A. LOW, at a late meeting of the Union Trust Company, moved a resolution, which was adopted, calling the attention of the press to the fact that "it is charged with a vast responsibility; that it has the power to mitigate the prevalent distrust or to intensify the general alarm"; and that "those journals of this city whose columns are employed to build up and sustain, and not to pull down and destroy, will command the highest degree of respect and gratitude on the part of the suffering community." This was a very timely hint, and we have no doubt will be taken in good part by those to whom it was addressed. The prevalent distrust has undoubtedly been spread and intensified by high-colored newspaper accounts of its phenomena, and this not intentionally, either, but through what may be called the *habit* of sensational writing and sensational typography. As long as the public buys more papers when it is excited than when it is calm, editors and reporters will have to be almost more than human to refrain from putting even commonplace facts in the most striking light; and the tendency in this direction is daily increased by the fact that sensational writing has ceased to be a vice, and has become an honored and highly-paid calling. The commercial world is suffering to-day simply because the reporter's lens is directed to it, not because the magnifying power of the lens is now in any degree increased. The most respectable men in the community, as well as the lovers of notoriety, have, during the last ten years, made a practice of submitting themselves in the frankest way to be questioned by newspaper emissaries, often at their own houses, concerning both their public and private affairs, and it is therefore not surprising if the notion of privacy or discretion, and even of propriety, has vanished from the reporter's mind, and he feels that he carries a general warrant to look into everybody's books and papers. The newspapers are in this particular, as in others, no worse and no better than the community requires them to be. The consequences of embellishment and sensation-mongering are just now more serious than usual, but the character of the work has not changed, and will not change, as long as the public enjoys it, as it really does.

There is one lesson of the panic, however, which has an important bearing on this point, and which the public as well as the press will do well to take to heart, and that is, that it is not possible in our day to confine a panic to any one large and important field of business. When the present crisis was brought on by the failure of Jay Cooke & Co., a storm of pitiless indignation was poured on the heads of railroad speculators and stock-jobbers. The newspapers and the merchants and professional men united in denouncing them, and even went so far as to express gratification that they had been overtaken in the midst of their sin. The panic was very generally declared to be a "Wall-Street affair," with which the rest of the community need not concern itself, and the fall of stocks was treated as a clear gain to legitimate investors. Indeed, for a week or two a "railroad man" who had not failed was treated somewhat as a criminal escaping his due. Nothing was left unsaid to bring railroad property into disrepute, or, in other words, to depreciate it, and render it difficult to sell it or borrow money on it; and all this apparently in the firm belief that it was possible to dissociate it from the other property of the country, and that the dry-goods trade, and iron trade, and all the other trades could prosper while stocks were falling, and brokers "bursting up," and railroad-builders stopping their work. The horror of "speculators" which broke forth on every side was rendered all the more remarkable by the vagueness of the term "speculation," and by the exceeding difficulty that any of us would experience in laying our hands on an American citizen, either among the laborers, or capitalists, or newsboys, or bishops, who has not at some time endeavored by hook or by crook to become possessor of a piece of property for the purpose or in the hope of selling it at an advance. Indeed, nothing in the way of moral distinctions is less plainly marked than the line which separates the Wall-Street "operator" from the great bulk of the community in his views as to the proper mode of making money, and it is just this vagueness and indefiniteness which most contributes to produce the cant which usually attends a panic. The absence of any sure way of knowing a wicked speculator from the common run of speculators, makes all the latter vociferous in denouncing everybody who speculates at all, and in pretending that they would as soon cut off their right hands as hold anything for a rise. A striking illustration of the lengths to which this kind of audacity may be carried is afforded at this moment by the performances of a most notorious advertiser and vendor of the trashy bonds of new railroad companies, on many of which he has levied blackmail. After helping, to the best of his ability, to fill the drawers of the poor with worthless securities, he is at this moment as busy and as loud as anybody in denouncing railroad-builders and speculators, and in wailing over "watered stock," a species of property which he seems to regard with positive loathing.

The fact is that railroad securities represent about $3,000,000,000 of money actually invested, some of it belonging to foreigners, some to Americans. From part of this a large income is derived; from the rest of it a large income is expected some day or other. A very considerable portion of these securities, whether yielding revenue or not, have come during the last twenty years to play a very important and useful part in commerce by being deposited as pledges for loans, not for speculative purposes simply, but for the legitimate wants of trade. They save a large body of business men the trouble of getting their notes endorsed when borrowing from banks, and they save banks the trouble of making examinations into credit. To discredit them violently and suddenly and sweepingly, as in the present panic, is therefore to cause payment of an enormous amount of borrowed money to be demanded suddenly from persons who did not expect to be called upon to pay it, and to whom payment on a falling market means ruin. It upsets the calculations of another body of persons who expected to borrow on these securities, in case they needed money, and causes an instant suspension or contraction of their operations. It also spreads intense alarm among that vast body of quiet investors all over the country who derive the whole or a portion of their income from railroad bonds or stocks, and causes them to restrict their purchases and hoard their ready cash. And, though last not least, it stops railroad construction and extension, and diminishes railroad traffic, thus striking at the iron trade a deadly blow. In short, as we now see, and as we pointed out in these columns a month ago, we have only to assail railroads and railroad securities for a very few weeks to bring every branch of industry to the verge of ruin, to fill every household with dismay, and to destroy abroad the credit or power of borrowing money to which so much of our past prosperity has been due, and from which so much of our future prosperity must come. The perennial wail over our "foreign indebtedness" has come from men who have never seriously considered in what condition the United States would be to-day if we had to depend for the development of our immense resources on the slow and scanty results of our own saving.

It is to be hoped that the lesson which was at last brought home to the public mind by the great peril of last Saturday will not be speedily forgotten. All industries in our day stand or fall together. We cannot attack one without endangering all others, and our aim about railroads should be so to reform their management that they may become not worse but better investments, and that the flow of capital into them may stimulate competition, and thus bring about that adjustment of rates to popular requirements for which, as American politics now are, or are likely to be, it is useless to ask at the hands of the Government.

MINISTERS OF FINANCE.

THE late attempt to resume payment in silver, and the subsequent explanations of its failure issued by the Treasury, have excited a good deal of merriment; but they have also, coupled with the performances of the Department in the matter of "the reserve," caused a good deal of alarm and mortification to a very large portion of the

community. We think the news from Washington—of the truth of which we know nothing—that a change was impending in the Secretaryship, gave a good deal of relief to many anxious minds. If the Treasury was now what it was from the last war with England down to the outbreak of the rebellion—that is, a place in which the taxes were received, and applied, under the direction of Congress, to the current expenses of the Government, it would make comparatively little difference who managed it, provided he was honest. But the financial policy which was adopted in 1861 has raised the Secretary from the position of a sort of paying-teller, or head clerk, into that of a Minister of Finance of the European type, with enormous discretionary powers over the banks and the currency of the country, and even the fortunes of its merchants and traders. He can build a bank up by his deposits, or save it from ruin by his indulgence; he can, as he now asserts, change the value of all property by inflating or contracting the currency; he can make the fortunes of his friends by timely information as to his intentions with regard to the sale of gold or purchase of bonds; and he can ruin any man engaged in foreign trade by the use of the army of spies and informers who now watch the importers at all the great seaports. No minister of finance has indeed exercised such powers in Europe since 1789. Something like them was to be found in France under the old régime, but yet nothing equal to them. Had Turgot wielded the authority which an inscrutable Providence lodged in the hands of Boutwell and Richardson, that great man might have saved the monarchy from ruin, and his country from eighty years of bloody and wasteful revolution.

Now the extraordinary thing in the history of our financial system is that at the very moment when it entered on its phase of greatest difficulty—the phase in which cold payment and adjustment took the place of hot and lavish outlay—there should have been a distinct and well-marked decline in the character and capacity of our financiers. There are two classes of national financiers, both of which have made a considerable figure in the world. One is composed of men who have, as bankers or foreign merchants, had practical and personal experience of the way in which human nature, impelled by the desire of gain, acts under varying conditions of trade and industry, and of the mode in which it meets or evades attempts to interfere with it by legislation. The other is composed of men who, without personal familiarity with the operations of commerce, have brought trained intellects to the study of the financial experience of the civilized nations, and have made generalizations from it for legislative use. To the former class has belonged a host of great names. Its members founded and governed, during several glorious centuries, the republics of Florence, Genoa, and Venice in the Middle Ages. To modern finance it has contributed the Rothschilds, Hopes, Barings, Ricardo, Cobden, Bright, Chevalier, and others who, if not ministers themselves, have exerted a powerful influence on the financial policy of modern nations. That they have not played a more active and prominent part in politics is largely due to the fact that successful banking and trading is too absorbing a pursuit, in the earlier years of a man's career, to render devotion to politics possible. To the other class belong Turgot, Adam Smith, Hamilton, Gallatin, Peel, Gladstone, and Chase. None of these men were bred to business; but they were all men trained to study, and who made themselves masters of that wonderful story—the efforts of the human race, from the dawn of history, to provide itself with an efficient and economical machinery for the exchange of its commodities. No man who has thoroughly familiarized himself with this record, and seeks to draw from it, not support for *à priori* crotchets of his own, but guidance for an unbiassed mind, can go very far wrong; and none of these great men did go very far wrong, considering the conditions under which they labored. The one whose policy is still open to most question, and receives most criticism, is Mr. Chase; and there are some parts of his policy which we should be sorry to defend. But then it is due to him, and to everybody else to whose lot it has fallen to provide funds for a gigantic war, to say that during a struggle in which the existence of a nation or of a government is at stake, no minister can be a financier simply; he is always, when devising ways and means, more than half a fighting man, and comes inevitably to share the feelings of the general in the field, and consider every expedient lawful and safe which promises the defeat of the enemy. Consequently, no minister has ever passed through that ordeal yet without doing many things which, when looked at afterwards with a purely economical eye, merited condemnation. Mr. Chase was no more fortunate than any of his predecessors. But he was nevertheless a statesman; he had a wide view and large aims, and had the respect of a man who has been trained in a laborious and logical and learned calling, for the work and experience of those who had gone before him.

When the time came to bring the country back to the ways of peace, to restore the connection between its monetary system and that of the rest of the world, and adopt the burden of taxation hastily assumed during the war to the shoulders of quiet industry, we needed not less of the right kind of talent and experience for the management of the finances, but more. We needed, in short, a first-rate man of either of the two classes we have named, and the President, to do him justice, seems at the outset to have had some such idea vaguely in his mind, but, as in some others of his reformatory aims, he was unable to carry it out. The result was that he handed the Treasury over to a kind of man whose appearance may be said to have constituted an absolute novelty in political finance—that is, a man who had no financial experience of his own, and openly scorned the teachings of financial history. Mr. Boutwell's commercial experience was that of the keeper of a small retail store in a country town—we do not mention this as an imputation, but as a fact. Whatever time he had to spare from the care of this establishment, whose operations were not complicated, he devoted to the pursuit which has ever since 1846 been called "politics," and which he himself bore a prominent part in introducing into this country. Before that period, "politics" was a term usually applied to the consideration and passage of measures having for their object the improvement of the machinery of government, the better protection of individual rights, the better distribution of taxation, the better administration of justice; and "a statesman" was a man to whom party, and the offices in its gifts, were simply bits of machinery for the embodiment of certain ideas in legislation. Not long after that year the new school, of which Mr. Boutwell was an active leader, triumphed, and they made "politics" what it is now—the art of multiplying and distributing offices. They created as many as possible, and made them elective and the terms short, and in this way gave a "politician" full occupation in getting himself chosen or getting his friends chosen, and preparing for re-election, so that he had no time left for the consideration of questions of government. The result was that, as we all know, the old breed of statesmen which began with the framers of the Constitution, and some few members of which have survived until our own day, who studied subjects, and had ideas, which they urged, and to which they were devoted, about taxation, and currency, and foreign policy, and civil and criminal jurisprudence, have disappeared from the political arena. The modern politician is a man who takes care not to have ideas of his own on any subject; he has as many of the ideas of his party as it requires him to have, but not one to spare, and advocates them as long as it calls upon him to do so; but *personal* connection of a public man with certain lines of policy is rare, and grows rarer. We consequently have leading "statesmen"—Mr. Conkling is a good specimen of them—who control the politics of great States, exert a powerful influence on the Administration, and wield its patronage, and hold a first claim to its leading offices, who have never been the authors or promoters of any measures of legislation, and have never been prominently connected with any particular set of opinions or with any great question, home or foreign. Their sole business is the management of canvasses and elections and the conduct of intrigues and counter-intrigues. To this class Mr. Boutwell belongs, and he does it credit. He is shrewd, adroit, hard-

headed, sure of his game in all political manœuvres, an expert manager of the men he has to deal with, and a profound disbeliever in any experience or generalization outside his own walk. He managed his little store honestly and successfully, without the aid of books on finance, and he got to be Governor of Massachusetts without studying the science of government, and it is not wonderful that it was impossible to convince him during his stay in the Treasury that there was anything, of which he was ignorant, tha tit would be well for him to know. It would be interesting, and we think it would be easy if we had the space to spare for it, to show that his policy with regard to the public debt, and the curious jumble of ideas about the currency which he has more than once produced in speeches and lectures, are those which one might expect *à priori* to grow up in the mind of a frugal and upright retail dealer.

Mr. Boutwell's appointment as Minister of Finance at a peculiarly trying time was, however, explicable by reference to his singularly successful political career, which would naturally make an impression on the mind of a man as new to civil affairs as General Grant was. The selection of his successor is very much less so. Mr. Richardson was a country lawyer, filling the honorable office of judge of probate in a country town, when Mr. Boutwell carried him to Washington as Assistant-Secretary of the Treasury. His financial training must have begun at this period, and it can hardly be said to have been begun under a great master. It is, therefore, not wonderful that, when he was left in possession of the Treasury, we should have been treated to the series of indiscretions and mistakes and bits of vacillation which have culminated in the "resumption" in silver of which the newspapers are making so much fun. We have no desire to give pain to as worthy a man as we believe Mr. Richardson to be; but he must himself see that he is in his present position greatly out of place, and he must see, too, that the school of financiers to which he and Mr Boutwell belong is hardly suited to the situation in which we find ourselves. We trust, too, that the rumor that the President is going to put in a great merchant who is familiar with the operations of trade and the laws which regulate the flow and value of money, is well founded. Political financiers are in our day a bad bargain, and no man is fitted to be the finance minister of a country like this, whose foreign commerce amounts to a thousand millions per annum, and which uses several hundred millions of foreign capital, who is not as familiar with the processes and conditions of international exchange as with his multiplication table.

ENGLAND.

LONDON, October 17, 1873.

THERE is one amusement which never seems to pall among English-speaking races, and that is what is called in Africa palavering. Englishmen of all sorts and condifions dearly love "playing at Parliament," and as an actor always goes to the play when he is not on the stage, a member of Parliament in the brief vacation is never so happy as when he is addressing somebody or other on public affairs, or assisting at the discussion of a "congress." When all has been said about their fussy and pragmatical airs, and their visionary programmes, it must be added that their congresses do bring a number of active and able minds together, intent upon the solution of the most interesting and important problems of civilization, and that they contribute in no mean measure to the promotion of that energetic public spirit and disinterested enthusiasm for the commongood which are the life and soul of public liberty, and the secret of stability in modern societies and institutions. Our Social Science Congress is gathering to itself year after year more and more of the thoughtful wisdom and good-will of unprofessional and even professional politicians. Its papers are more and more direct and practical in their aims, and it would not be difficult to point to its peaceful conquests on the statute-book. The Church Congress is a neutral territory, upon which High and Low, Ritualist and Evangelical, are invited to meet and confer with distinguished laymen upon the modes and means of promoting the interests and developing the influence of the pulpit and the altar among all ranks of society, and replacing a church-rate by voluntary devotion. It was impossible not to perceive in the general current of the papers and addresses an uneasy consciousness that, in spite of the splendor of the new ecclesiastical edifices throughout the country, of the proposed benefactions of wealthy and powerful patrons of the revival of ecclesiastical fervor, and of the feverish activity and ardor of the rival schools of theology, the days of the Establishment were numbered, and that its internal dissensions were rending it to pieces. The Bishop of Oxford is painfully anxious to disabuse the working-classes of the notion that the Church is on the side of the landowner and the capitalists in questions of wages and strikes; and Canon Girdlestone, who has proved himself the practical friend of the poor agricultural laborer, strengthened the Bishop's appeal to popular sympathies by the evidence of his own example. The prevailing opinion of the Congress was in favor of a benevolent neutrality, or rather a wise abstention from interference in secular disputes. Mr. Freeman, the historian, who is nothing if not archæological, insisted on the restoration of cathedrals to their ancient importance, whether in their offices of public worship or as centres of theological learning and discipline. But the most palpable hit was made by a Manchester alderman, who, fortified by his own experience as a tradesman, urged the bishop and clergy to "go in for" showy and attractive ritual, candles, vestments, incense, processions, and the rest of it, while the Hildebrand of the west country, Archdeacon Denison, unhappily thrown away upon a Somersetshire parish, called a meeting of his own by special ticket to protest against his own bishop's authority in withdrawing the license of a Romanizing curate, and shook a cudgel at the head of a speaker of opposite views who had somehow or other found his way into the company, and had the audacity to rise to propose an amendment.

These episodes and diversions made the Church Congress much livelier than the Social Science gathering; but whether weak brethren were edified by the proceedings, or the respect of the "masses" was conciliated by the Archdeacon's rebellious and despotic cudgel, is quite another question. The meetings of the Congressional and the Baptist Unions, which followed the Church Congress, were less dramatic in their incidents, and perhaps less remarkable for the culture and quality of their audiences; but, at all events, they met and parted in peace and harmony, and more in the spirit of primitive Christians than of a mediæval council. When, indeed, one compares these ecclesiastical and congregational parliaments with the British Association for the Advancement of Science, one is struck with the utter and fantastic unreality that pervades the former, and the perfect clearness and calmness of the latter's motions and debates. There is a need of faith as of love in the instincts of mankind which the representatives of the Church and her sects altogether fail to satisfy; there is a need of wider knowledge of nature's laws, to which the representatives of science appeal without exciting derision, even when, as sometimes happens, the physiologists or the geographers are not quite agreed. The most interesting paper at the Bradford meeting was Dr. Ferrier's account of his investigations into the functions of the brain, and his discovery, by a series of dissections, of the localized action of certain portions of the brain upon the nervous system and those muscular movements which in mankind are classified as operations of the will. Captain Markham's arrival lent a vivid interest to the discussions in the Geography Section on Arctic research, and especially the *Polaris* expedition.

Politics proper have not subsided into quiescence during the recess. It has been an unusually active season of electioneering, and the result of the contests at Bath and Taunton has revived the drooping spirits of Ministerialists, if it has not restored confidence to the Cabinet. Captain Hayter's success at Bath, however, was in point of fact a success of local influence skilfully plied, of electioneering tactics, and of the personal popularity of the candidate. Mr. Forsyth, his Conservative opponent, is an accomplished scholar and a successful lawyer; but he is rather a chamber counsel than an advocate, and more like a learned professor than a lawyer who goes into the House of Commons to qualify himself by party services and speeches for promotion. Don't believe that Mr. Disraeli's slashing letter to "My dear Grey," in the style of an election speech of fifty years ago, and probably not intended for publication, had anything to do in "turning the tide" against the Tory candidate. The tide was turned already, for Bath is essentially a Radical borough, and party spirit runs high there upon occasion. I am as far as possible from admiring the virulent, confidential rhetoric of the leader of the Opposition, but I much doubt whether even its publication was so mistaken as the Liberals suppose. It sums up, in a few stinging sentences that will stick in the average British elector's memory, a great many items of the dissatisfaction and discontent that do undoubtedly prevail far and wide in the country, and even in Liberal constituencies. The army, the navy, the universities, the charitable foundations, the shipping interest, the railway interest, the licensed victuallers, the farmers, the working-classes, the Church, and the Nonconformists, are all for various and perhaps contradictory reasons disaffected towards the Cabinet. Mr. Gladstone is perhaps paying the penalty of the prodigious popularity that swept him into power five years ago, and still more of the incessant and nauseous adulation of his organ in the London press. The rationalistic and philosophic section of the Liberal party dislike his theological and ecclesiastical tastes and twang;

ardent Protestants dislike his casuistry and his coquettings with ultramontanism in Ireland; and all the propertied classes distrust his restless and disturbing passion for change, and feel the ground crumbling beneath them just as long as he remains in power. The average Englishman prefers stability and security to all things, and he believes Mr. Gladstone's régime to be fatal to stability and security. And as to the rest of the Cabinet, they are pretty generally regarded as sentimentalists or prigs, and it is hard to decide which of these two categories the British elector hates most. Of course, there is extreme injustice, exaggeration, and unreasonableness in many of these grievances and complaints. I content myself with recording their existence.

The victory of Mr. James, the new Solicitor-General, at Taunton, was a genuine triumph for the Government, in the face of a most unfair and unusual contest for a seat vacated by his acceptance of a law office. But it must not be forgotten that Mr. James has shone in Parliament rather for his independence than for his devotion to Mr. Gladstone, and has not only conspicuously differed from the Government, but from an extreme section of the Liberal party, upon more than one point. He has partly won his promotion by his success at the bar and, what is much rarer in a lawyer, his extraordinary success in a Parliament where he has shown himself something more and better than a *nisi-prius* orator. His pleasant personal qualities have won him many friends among all parties, and he is a favorite at his club and in London society, as he is at Taunton, where he appeared for the first time five years ago, unknown except as a rising barrister. His opponent the other day is a gallant officer, who served with much distinction in the Crimea; he belongs to an old Somersetshire family, in the neighborhood of Taunton, and his father was one of the most popular leaders of the Western bar. But he himself is scarcely capable of putting two sentences or two ideas together when he is on his legs; he resides in London, and has really no local influence at Taunton; and he incurred some ridicule by being attended during his electoral contest by a spokesman, in the shape of Mr. Alfred Austin, a poet and a journalist of considerable merit, but who had also been an unsuccessful candidate in former years at Taunton. He complains, it seems, that a hundred and more Tories who promised to vote for him stayed away from the ballot urns. No doubt they repudiated the sharp practice of contesting a seat under such circumstances, and sacrificed their principles to a love of fair play.

The coming political event is the speech which Mr. Bright has undertaken to deliver to his constituents at Birmingham next week. It will probably disappoint his Radical constituents; for Mr. Bright not only feels the responsibilities of office, but the risks of over-exertion and excitement to a shattered nervous system. The plain fact is that he has never fully recovered from the attack which compelled his retirement into private life, and that he is neither equal to public speaking nor to ministerial functions. His motives in joining the Cabinet at this critical moment, with an odious and lamentable Ashantee war on hand, and an unsettled quarrel with the Nonconformists, must be supremely disinterested; how far he will strengthen a shaky administration remains to be proved.

Correspondence

"DARWINISM" AND NATURALISTS.

To the Editor of the Nation:

Sir: As the *Nation* has done me the unexpected honor to notice my views, or supposed views, on Darwinism in two distinct articles in its number of October 16, I may claim permission, not on personal grounds, but in the interests of science, to say a few words on a subject which seems to be of some interest to your readers, and which I regard as of no little present importance.

In the discussion in the Evangelical Alliance mentioned in your "Notes," the question put to me was not whether I believed in the Darwinian theory, but whether that theory is necessarily antagonistic to Holy Scripture. In answer, I stated that the doctrine of evolution, when carried out to its full and logical consequences, appeared to me to be subversive even of theism; but that Darwinism, as expounded by its great author, seemed to require the creation of at least a few species. I further stated that natural selection, as applied to the origin of varieties and races, has an unquestionable scientific value, though its importance, even in this, is probably overrated by its enthusiastic advocates; but that, as applied to the origin of species and of man, it is not only opposed to the Biblical account of creation, but destitute of scientific proof. These theses I endeavored to support by such illustrations as occurred to me at the moment, at the same time cautioning my auditors against the error that all species received by naturalists must necessarily be good species in the sense of separate creations, and also against attributing to the writer of Genesis the doctrine that all species were produced in the same way, which cannot be fairly inferred from his words. Of course the short newspaper reports could not give any perfect notion of this line of treatment, and the portions of sentences you have quoted give no clue to my meaning.

To the temperate condemnation of my little popular book, the 'Story of the Earth,' by your reviewer I can make no objection, except that under the title of the "Attitude of Working Naturalists towards Darwinism," one would have expected a reference to other publications than those he has treated of. More especially I would commend to his attention the crushing refutation of the theory of derivation in Barrande's recent memoir on the Trilobites, the author of which, as a palæontologist, certainly stands at least on a level with any of those whose somewhat timid support of this theory your reviewer eulogizes. Even in my own case he might have referred, under the heading which he has chosen, not so much to the statements made in a popular work, and in reference merely to the application of evolution to the case of man, but to my argument as a "working naturalist" in my memoirs on the Post-pliocene shells and the Devonian plants, as to which, if I am not mistaken, he would have found himself, as a successful scientific worker, more at home than in the treatment of the question whether our remote ancestors were apes.

J. W. Dawson.

McGill College, Montreal, Oct. 28, 1873.

THE SAMANA BAY COMPANY.

To the Editor of the Nation:

Sir: An editorial article upon the Samana Bay Company in your paper of the 23d inst. contains some errors of fact, which you will allow me to correct; and some errors of opinion, which you will perhaps permit me to controvert.

The gist of your article is this: "That the barbarous population of the interior of Santo Domingo are now in arms against him [President Baez], and threaten to descend on Samana Bay and clean out the intruders, as they regard them, to whom he has conveyed so much Dominican soil"; that Baez cannot defend the Company to which he has granted such wonderful privileges; that therefore the Company is urging our Government to protect them. This is erroneous as a whole, and erroneous in all of its parts. The "barbarous population of the interior" are not now, and have not been, in arms against Baez. You have been misled, probably by reports spread purposely by parties in Hayti, who have an interest to be promoted by misleading our press, and do mislead it systematically. You suggest the idea that the Company's possessions and its settlers have been in danger of being assailed and driven out by the barbarous population of the interior of Santo Domingo, and of course will always be so endangered. This idea, put forth by an authority so eminent as yours, may do the Company harm; and, as it is not justified by facts, should be corrected. The Company has difficulties enough to overcome in shape of stern realities at home, and should not have added to them any in the shape of popular prejudice and groundless apprehensions. The facts are as follows: In August last, a small band of Dominican exiles and roving military adventurers, with which those regions swarm, congregated in Hayti, with the purpose of getting up an invasion of Santo Domingo, and, if possible, provoking an insurrection. As usual, they found aid and comfort in that country. Some of freebooting tastes, joined by a few Haytians, crossed the mountains into the territory of Santo Domingo; others, filibusters of piratical turn, went along the coast by boats, all plundering as they went. They gathered in the western province, which has long been debatable land or disputed territory; and induced, by threats and promises, some Dominican chiefs and starving soldiers to join them, and attempted an expedition into the province of Sebao.

I have a letter from President Baez dated Santo Domingo, September 25, in which he says: "To counteract American influence, which Hayti does not know to be so small as it appears to be, the Haytian Government has again attempted to suborn some of the military chiefs of the northeast. The defection of a few of these, bought by Haytian money (or that of some other power), and the actual presence in said territory of some insurgents, armed and equipped, caused from the fourth to the fifth of the month an alarming state of affairs in the Sebao. Nevertheless, our troops and the population, always loyal to our Government, came to the rescue; and on the 11th, after three bloody and decided attacks, all of those not killed, wounded, or prisoners fled precipitately over the border into Hayti." "The arms of our Government triumphed completely; and in six days after there was no vestige seen here of that so-called rebellion organized abroad with so much care and cost."

Private correspondents confirm this statement. All has been quiet ever

since. Moreover, the Peninsula of Samana was not endangered or even threatened. The disturbances were in a distant province. No settler in Samana dreamed of any danger; least of all, that of being "cleaned out." Owing to its location and configuration, the Peninsula is impregnable against any but a regular and formidable army, supported by a fleet. Besides, its inhabitants, who are mostly descendants of colored settlers and refugee slaves from the United States, are unanimously and earnestly in favor of the occupation of the Peninsula by the Company. So strong is the feeling among them that their prosperity and all their interests will be protected by the Company, that they would, if need be, resist all invaders—even Baez himself.

Next, you say that "as Baez has not even the power to protect the Company," they are "urging our Government to do so," and that "Dr. Howe, Mr. Fabens, and Mr. O'Sullivan have come to Washington to urge our Government to protect them."

First, the Company possessions have not been endangered or even threatened. Second, they have not appealed to Baez for protection against invasion. Third, they have not appealed to our Government to do so. Dr. Howe has not had the misfortune to be in Washington for two years, and trusts to be long spared from being there. Mr. O'Sullivan has no more to do with the management of the Company than your "devil" has, perhaps a trifle less. Mr. Fabens was in Washington, but with no such purpose.

Finally, you say "that the Company should imitate its great prototype, the East India Company, and defend itself, sword in hand, against the barbarians. If it does, we shall all be proud of it." Precisely so; and if the Company gets extricated from its present embarrassment at home, and selects out of the thousands of eager applicants for emigration only two hundred sturdy Yankees, and fairly settles them on the Peninsula with their ploughs and their rifles, I trust that they will defend it from all barbarians, and all others, and that they will make you "proud of them." If they do not, I shall be ashamed of them. Respectfully,

SAMUEL G. HOWE.

BOSTON, October 28, 1873.

[We can say truly that we are heartily glad that the story, which we found in a despatch to the Boston *Advertiser*, is not true, and wish the Company all possible success, as long as it is content to take care of itself. We were ready to believe that it was seeking relief at Washington, owing to Dr. Howe's, avowal in his letter to the *Tribune* last January, that he was eager for annexation, and rejoiced over the formation of the Company as "quasi-annexation." —ED. NATION.]

THE GENEVA AWARD.

TO THE EDITOR OF THE NATION:

SIR: There is one consideration which your correspondent, in the *Nation* of Oct. 23, does not mention, and yet it is one which should have some weight with those who argue this question of the rights of insurers from a premium standpoint. A very large proportion of the marine insurance of this country—so large as to make the rest hardly worth mentioning—is done upon the mutual plan, so that the owners of the vessels and cargoes lost were really their own insurers. This fact, brought out very clearly by one underwriter in a letter to the *Economist*, it seems to me very effectually disposes of the argument that the underwriters made money by the increased premium. If this increased premium had not been necessary to pay the losses, it would have been returned to the men who paid it in scrip dividends. Every dollar paid by the Government, therefore, to the mutual marine insurance companies, goes directly back to the very men who paid these war premiums, and, as every year's business is kept by itself, there would be no difficulty in determining to whom the money from any one of these claims belongs.

I only offer these suggestions for the use of those persons whose reasoning powers are unable to grasp the moral questions involved in an appropriation, by the nation, of money awarded in trust for the payment of specified claims. EDITOR INSURANCE JOURNAL.

HARTFORD, CONN., Oct. 28.

[The present members of mutual insurance companies are not, however, the men who lost their ships during the war, and to reimburse these or their heirs, the old accounts would, contrary to the practice of these companies, have to be reopened. An act was, we believe, passed by the last Legislature of this State, authorizing the New York Mutual Companies to take this course.—ED. NATION.]

A NOTE FROM DR. HALL.

TO THE EDITOR OF THE NATION:

SIR: In the *Galaxy* of the current month, which reached me this morning, I find myself coupled with your estimable paper in an article which I need not characterize. "A writer who is allowed to use the columns of a journal of the *Nation's* position, and, above all, of its pretensions, has deemed Dr. Hall's book ['Recent Exemplifications of False Philology'] worthy of careful attention and even of commendation." Of this serious fact the public is admonished by Mr. Richard Grant White, and I trust that, in consideration of the *nexus* thus indicated, you will allow me the privilege of a few lines touching that singular phenomenon of urbanity.

Mr. White, some time ago, in a letter communicated to a journal of your city—a letter which he very credibly states that you declined to admit into your columns—compared my above-named work (the success of which has rather surprised me) to the barking of a pregnant, toothless bitch:

"Tantidem, quasi foeta canes, sine dentibu' latrat."

In the article before me, I am said to exhibit myself as "simply a man born without the sense of decency, and in whose nature self-conceit takes the place of self-knowledge"; and I am called "the Yahoo of literature, one of those creatures who, if encountered at all, must be handled without gloves, and—uncleanly task—'polished off' for the benefit of society." If this be the language of gentlemen, be my portion with—the ladies. Moreover: "Measured from the depth of his meanness to the height of his impudence, he is, indeed, an enormous creature." Can Mr. White believe that this kind of writing ever harmed any one but the person who indulged in it? Respecting a point where Mr. White and his clients have not the least conception of my very obvious meaning, the following conversational estimates of me are adduced: "The fellow is an ass," and "The man's a spluttering idiot. His evidence isn't worth a rush." Once more, as if to discredit me, I am represented as a "Vermont Yankee" and as "this Yankee pink of Anglicists." It is not of the slightest consequence, most assuredly, whether I am a Yankee or not; but it is worth while to be sure of the veracity of an assertion, even regarding so unimportant a matter as the place of my birth; and the fact happens to be that I am a native of New York.

To Mr. White I have never applied one unseemly epithet, and it lies quite beyond his ability to move me in any degree to imitate his bad example. His behavior under scarification is by no means a model of dignity or even of fortitude. As to my numerous criticisms, he and his aids have not invalidated a single one of them. This I intend to show at my leisure, and, besides, that they have often misunderstood me, and often misrepresented me. My 'Modern English,' copies of which go to America with this letter, is studded with incidental strictures on Mr. White's shallow philology, and these, in the meanwhile, will enlighten heedful readers afresh on the character of his critical pretensions. In a letter from him which you have published, he predicts that this book of mine "cannot fail to be an interesting one." I thank him for his favorable anticipation; and, in return, I wish him a speedy restoration to that peace of mind, serenity of temper, and dispassionateness of judgment by which it was benevolently inspired.

Your obedient servant, FITZEDWARD HALL.

HILL HOUSE, MARLESFORD, WICKHAM MARKET, Oct. 8, 1873.

Notes.

WE are requested to announce for Messrs. A. S. Barnes & Co. that their projected *International Review* will appear six times a year, being changed from a quarterly to a bi-monthly.——There are fifteen Brazilian students at Cornell, mostly pursuing courses in mechanical and civil engineering. They appear to have united in establishing a monthly journal in the Portuguese language, called *Aurora Brasileira*, with a view to its circulation in their native country. Sr. H. de Aquino is the editor. The first number is chiefly filled with the proceedings at the local celebration of the independence of Brazil on the 7th September, and the editor furnishes a poem on the same subject. Prof. Ch. Fred. Hartt begins a series of articles on Indian (Tupí) myths. There is an earnestness about this literary venture which recommends it pleasantly.——We have received from Scribner & Co. the first number of Mrs. M. M. Dodge's magazine for children, *St. Nicholas*. In appearance it recalls, though it hardly equals, the regretted *Riverside Magazine*, and the publishers have borrowed from the same model a bad feature along with the best. We refer to the illustrations of Mr. Stephens, which are feeble in wit, false in drawing, and vulgar in tone. Experience will doubtless show that it is difficult to conduct a magazine of this sort so as to suit at once children who can only read large-letter monosyllables and those who have begun the study of German.——Professor W. F. Allen's

selected catalogue of the Tank Library, now forming part of the Wisconsin Historical Society's Library, has been printed separately from the Society's catalogue. It describes by title and otherwise the principal works in Dutch History, Books of Travel, and General History. Mr. Motley's authorities are carefully pointed out.——The Fifth Annual Report of the Peabody Academy of Science records some very important additions to the Museum, such as remains of the Mound Builders in the Mississippi Valley; stone and bone implements from the prehistoric sites of Denmark and the Swiss Lakes; the very large and valuable collection of relics of the stone age in New Jersey, given by Dr. Charles C. Abbott of Trenton; some casts of ancient Mexican sculptures, etc., etc. "Such public institutions in the county [of Essex] as are willing to provide proper accommodations and are desirous of forming local museums," will receive what duplicate specimens the Museum can spare.——Ginn Bros. announce an edition of Balfour Stewart's 'Elementary Physics,' with questions and exercises by Prof. G. A. Hill.——Mr. William F. Poole, the accomplished librarian of the Cincinnati Public Library, formerly of the Boston Athenæum, has accepted a call to the Public Library of Chicago, his work of organization being nearly over at the former institution, and his talents in this direction being greatly needed at the latter. We dare say he shares the reluctance which Cincinnati naturally manifests in parting with him.——It appears that the newspapers were mistaken in saying that Professor W. W. Goodwin, of Harvard, had resigned his position in that university. He has, we believe, been allowed an indeterminate leave of absence, and will for some time to come reside in some part of Southern Europe, where his wife will seek restoration to health.

—In answer to several enquiries, we would state that Mr. Dorman B. Eaton's pamphlet on the New York judiciary may be procured of Mr. James Miller, 647 Broadway (price, ten cents). A correspondent, writing from Norwich on this subject, says: "I wish to call attention to a statement at the beginning of the pamphlet, which is not literally correct, and that is, that prior to 1846 all the judges in every State were appointed and not elected. In Connecticut, the judges have always been elected by the General Assembly. In the first settlement of the State, all judicial powers were vested in the General Assembly. In 1711, a Superior Court of five judges was constituted, consisting of the deputy governor and four assistants annually appointed by the legislature. Under various modifications, the system was continued until 1818, the members of the Court being, however, annually appointed by the General Assembly. In the Constitutional Convention of 1818, the question most warmly discussed was the election of judges and their tenure of office. It was finally fixed 'during good behavior,' though attempts were made to fix the term at five years, or three years, or during the pleasure of the General Assembly. The limitation of age was seventy years. The judges were elected by the General Assembly under this provision until 1857, when their term of office was fixed at eight years. It will thus be seen that the judges were never appointed in Connecticut except by the election of the legislature. The advocates of constitutional reform in this State allege that an election by the legislature is the worst system that can be devised, as it gives more chance for political trading than any other."

—It is said that there are no text-books to be recommended for students in zoölogy. This is the refrain of Mr. Agassiz's lecture on "The Structure and Growth of Domesticated Animals," published by the Massachusetts Board of Agriculture, and just reprinted in the November number of the *American Naturalist*, and also of other such discourses. Why have we not had, why may we not have, such text-books? In other departments of natural history—in geology, mineralogy, vegetable chemistry, physiology, and botany, we are fairly well supplied with American text-books, which are highly esteemed and much used in the Old World as well as at home. There is no lack of zoölogists, comparatively, at least. Those capable of doing useful work greatly outnumber the botanists. Are they doing their duty in this respect? Much is said, and justly (as in the address above referred to), of the importance and the duty on the part of the community of cherishing and supporting scientific men, especially zoölogists, that they may do their work in research and education. It seems to us that no secondary part of this work and of their duty is the preparation of fit elementary treatises, and their maintenance at the proper level in successive editions. We repeat what we had occasion to remark the other day, that "there is too much disposition among scientific men in this country to look upon the work of popularizing science as something altogether beneath the dignity of the professional investigator, and thus to abandon the field to such third-rate men as publishers may chance to pick up"; and then, we may add, to disparage or endeavor to dispense with all text-books, because poor ones have naturally sprung up like weeds in the fallow ground which should have been preoccupied with better.

—The past summer has been an unprecedentedly dull one among the journalists, owing chiefly to the stand taken by the *Tribune* with regard to the "ball of discussion." The early autumn, however, has been enlivened by a vigorous argument as to the relative merits of the Louisville *Courier-Journal* and the London *Times*. Mr. Henry Watterson, the editor of the *Courier-Journal*, has been travelling in England during this summer, and has written home a number of letters in which he has complained warmly of the dulness of the British press. Since his return, he has also made an address on American journalism. The London *Times*, he hints, would compare unfavorably with many a Southwestern journal for vigor, point, and that peculiar kind of humor which the sons of the Southwest know as "being spicy." But the great difficulty with the *Times* is its impersonality. It is owned, edited, and written, no one knows by whom; and we imagine, though Mr. Watterson does not say so, that he finds it hard to understand how newspapers managed in this way can live. Mr. Watterson has a very high opinion of journalism as a profession, and thinks that Shakespeare, if he were living now, would be editing a paper somewhere. Going over in his mind the list of the successors of Shakespeare, it has occurred to him, he says, that it is a little singular "that a man of such varied and large resources, of such vigorous, current, and racy faculties, as Dion Boucicault, should be comparatively a poor man, wandering about the world and writing plays, when he might be, had he bent himself that way, the editor of the London *Times*." This suggestion at once brought "G. W. S.," of the *Tribune*, into the discussion, he saying that Mr. Watterson is totally mistaken, and that Mr. Dion Boucicault could never have been editor of the *Times*, because, though he has many talents, that gentleman has neither judgment, steadiness, nor a sense of responsibility; is a conspicuous member of that band of Bohemians, to be found all over the world, who possess in perfection the opposite of these qualities—who have "wit, and some culture, plenty of knowledge of the wrong side of the world, views on all questions, and a familiar acquaintance with the arts which make life a failure"; and, finally, that Mr. Boucicault, had he been editor of the *Times*, would have "edited the *Times* into bankruptcy in a twelvemonth."

—The controversy, which had previously seemed a little abstract, now began to have a human interest. The assertion that he was a Bohemian, and had no judgment, steadiness, or sense of responsibility Mr. Boucicault might have possibly passed over; but the insinuation that had he been editor of the London *Times* he would have edited it into bankruptcy in a twelvemonth, touched him closely; and he has written a letter to the *Tribune*, "for his own hand," in which he says that, with reference to the charge that he has so unsteady, reckless, and Bohemian a mind as to unfit him for the discharge of such important and serious functions as those of editing the *Times*, he is obliged to admit the charge to be true. "I have neither the ability nor the conscience," he adds, "to direct the great English newspaper, for it requires the ability to adopt and sustain any set of opinions that may be popular and salable at any given moment, and the conscience to reconcile the art of tergiversation with a character for sound judgment, moral steadiness, and a sense of responsibility." He then proceeds to give a searching comparative analysis of the career of the *Times* and himself since the beginning of the century, and shows conclusively that while he has been engaged in elevating the position of the drama, or rather of dramatic literature, the *Times* has been steadily engaged in degrading journalism to the lowest level. This interesting discussion is still going on, and whatever may have been the character of the English press three months ago with regard to impersonality, it must certainly be admitted that its position is being rapidly changed; for between Mr. Watterson's denials and "G. W. S.'s" assertions we are getting now not only weekly instalments of the personal history of the large number of gentlemen who might have been connected with the London press had their minds tended that way, but of the actual editors, owners, and writers as well, with all of whom, it seems, "G. W. S." is on terms of intimacy, which, if it did not seem so very open, we should say was very close.

—"Mark Twain" has been lecturing in London on the Sandwich Islands with very good success, his object being, as he says, to assuage the rabid and devouring thirst for information on this subject with which the public mind is consuming itself. The delivery of the lecture has given the English newspapers reason to reflect for perhaps the fiftieth time on that attractive topic, American humor, and they seem now to be getting a good deal nearer a comprehension of the matter than they have been before. Hitherto, it seems to have been assumed that any American who made another American publicly laugh was a humorist, and we have been assured that we produce a greater number of them annually than any other people in this world. It did undoubtedly make some persons rub their eyes to be told that the list of American humorists includes not merely the names of such men as Lowell, Holmes, or Irving, but those of "A. Ward," "Mark

Twain," "Josh Billings," and their imitators; but we did our best to believe that the critics on the other side were right. Now, however, some considerations seem to have occurred to them which had occurred to us before, and which may materially modify the general Anglo-Saxon view on this subject. Those considerations are that the classification of all persons who make us laugh as humorists is a little too broad, and that there are other classifications which in future criticisms may be found of great use. The English language possesses not merely the word humorist, but the words wit, satirist, wag, buffoon, jester, merry-andrew—all of which have different meanings; and it formerly possessed another word, which the late Artemus Ward was in the habit of applying with great enjoyment and descriptive force to himself—the good old Saxon word, fool. All these words, however, are fit for use, and as the long list of "humorists" is continually increasing ("Max Adeler," "Bill Arp," and the "Danbury Newsman" are three of the later additions), a discriminating employment of them at home and abroad will be likely to meet a "long-felt public want."

—Mr. Thomas Nast is this autumn and winter delivering lectures which he illustrates with what his great predecessor, Hogarth, would call "caracaturas," drawn by him in presence of his audience. They naturally are pleased with this new feature of our popular American entertainment, and the course of illustrated lectures bids fair to be profitable to the lecturer, and profitable, let us trust, to his hearers and spectators. We believe his topic is American humor, and we hear it said that his favorite specimens he draws from the Western newspapers. One of the best of the kind that we have ever seen is the following. It is told in the Cincinnati *Gazette* about a gentleman named Bennett, now with the departed, we believe, but once a city editor of the Cincinnati *Enquirer*. It is well known in the profession that sometimes it happens that there is absolutely no news whatever, and also that, in spite of this destitution, the various news departments must be filled with the usual fulness. It is under such circumstances that a city editor reveals whether or not he is a man of enterprise. Our Mr. Bennett was; though he appears to have had less versatility than is commonly displayed by persons in his way of life. His regular plan, when news was scarce, was to make small children—offspring of the brain alone—fall from the Newport ferry-boat into the Ohio River, where they would certainly have perished had it not been for the gallantry of a gentleman standing near, who plunged in and rescued them, this gentleman always being some personal friend of Mr. Bennett's, whom he thus delighted to honor. They, however, or some of them, began by-and-by to cease enjoying this distinction, and one of them, a Mr. Kellum, who had several times figured as a saviour of perishing innocents, demanded that the joke should not be repeated. He was assured that his request, though it must have seemed proof of a curiously sensitive disposition, should be complied with, and complied with it was. For on the following day Mr. Kellum read in the *Enquirer* that on the day previous a beautiful little girl, the child of a prominent citizen of Newport, had fallen from the Newport ferry-boat into the river, and that Mr. Kellum, who was standing near by, and who could have rescued the child from a watery grave, refused to render the slightest assistance. Naturally, Mr. Kellum forthwith betook himself to the *Enquirer* office, where he arrived boiling over with rage, and proceeded to make the most severe threats as to what he would do with Mr. Bennett in case this pleasantry continued. Mr. Bennett, however, pulled off his coat and said, "See here, Kellum, you are not a bad fellow in your way; but I can't stand any interference with my department. If I make any statement in the *Enquirer*, you mustn't come around here contradicting it. That isn't journalism." Mr. Kellum began to see what a mysterious thing journalism is, and it is said that from that time on he and Mr. Bennett were excellent friends. This sort of thing was and is perfectly common throughout the country, though of course the West had and has the most of it—a proof rather of the freedom of Western manners than of any difference between the wit of the West and East, for many of these Western editors have been Eastern men. It is a wonderful development of journalism, and very puzzling to the foreign observer not to the manner born. It is wicked perhaps, but it is amusing too. In all conscience, it is better than the mud-flinging in which some of our eminently respectable newspapers indulge themselves.

—The eighth volume of M. Paul Mesnard's edition of Racine's works has a peculiar value for students of French, as it consists of a complete lexicon of the language of Racine, with a grammatical introduction, and a study of that author's style, besides other interesting information. The sixth and last volume of M. Feuillet de Conches's 'Louis XVI., Marie-Antoinette et Mme. Elisabeth,' from unpublished letters and documents, has appeared. It has two portraits of the Queen, at the height of her splendor and in her wretched captivity. Under the title of 'Types révolutionnaires,' the Comte de Martel publishes a study of Fouché and the Communism practised in 1793, and promises a second volume on the same subject. Fouché held that riches in the hands of individuals are only a trust which the nation has a right to dispose of as it sees fit, and he acted accordingly. 'Les Hommes de la Commune,' by M. Jules Clère, has reached a fifth edition. It is a complete biography of all those who took an official part in the insurrection of the 18th of March. From it, it appears that more than forty members of the Government were under the age of thirty-five, and the majority workingmen, with a large sprinkling of cobblers. The labor question is discussed in the interest of the so-called industrial partnerships by M. Charles Robert in his 'Le Partage des Fruits du Travail—étude sur la participation des employés et ouvriers dans les bénéfices.' The author appeals to experience to prove the advantages of this form of co-operation. While it is admitted that the Revolution and the Restoration did little or nothing for primary education in France, the extent to which public instruction existed before 1789 has been open to debate. For the diocese of Rouen, M. de Beaurepaire has undertaken to show (in three octavo volumes) that schools were abundantly provided for all classes ('Recherches sur l'instruction publique dans le diocèse de Rouen avant 1789'). His work is valuable for its facts, but the inferences to be drawn from them will largely depend upon the reader's opinion of the worth of clerical instruction in the period under review. Another historical study of some value is M. T. Perrens's 'Church and State in France in the Reign of Henry IV. and the Regency of Marie de Médicis.'

—The late King of Saxony will be remembered mainly as a scholar, and his reputation would be a creditable one even for a private man. In 1828, when he was but twenty-seven years old, he printed for private circulation a translation of the first ten cantos of Dante's 'Inferno.' It was the first specimen of a work that occupied him for many years. In 1839, his translation of the whole of the 'Inferno' was published, followed the next year by that of the 'Purgatorio,' and in 1849 the work was completed by the translation of the 'Paradiso.' It appeared anonymously, as the production of one who called himself "Philalethes." The indifference with which Dante had been regarded in Germany up to the beginning of the century, and which finds curious expression in the correspondence of Goethe and Schiller, was beginning to pass away under the influence of the newly aroused historical and critical spirit of the times. Schlegel had done much to direct the attention of the lovers of poetry to the surpassing merits of the great Italian poet. Between 1820 and 1830 the study of Dante in Germany was pursued with great zeal. Two complete translations of the 'Divine Comedy,' those of Kannegiesser and Streckfuss, were published, besides translations of the 'Vita Nuova' and the prose works of Dante. Karl Witte had already begun his series of studies, critical, historical, and explanatory, which long since gave him the place of highest authority among the students of the poet, and secured him the gratitude of future generations of scholars. To this same period belong the useful 'Beiträge für das Studium der Göttlichen Komödie' of Abeken, and the earliest publications of one of the most exact and deserving of the students of Dante, Dr. L. G. Blanc of Halle. The work of Prince John was one of the best fruits of this new zeal in Dantesque studies. In spite of the continued and unflagging interest with which these studies have been pursued, and the additions made to knowledge of all that relates to Dante and his works, the translation by "Philalethes," and the abundant comment that accompanies it, remain among the best contributions that Germany has made to the understanding and appreciation of the 'Divine Comedy.' The translation is in blank verse, and aims at as literal a rendering as is consistent with its form. It has few happy poetic felicities, but it is generally simple, direct, and fluent. It has gone through three editions, the last having appeared, with a modest and touching preface, in 1865–6. The comment is of permanent value, especially the part relating to the 'Paradiso,' from the fulness of its references to the passages in St. Thomas Aquinas and other Schoolmen that illustrate the theological conceptions of the poet. It is excellent, also, from the abundance of its historical notes, and it everywhere displays the result of the patient labor of a careful and serious student. In his preface the Prince acknowledges his obligations to his friend Dr. Carus for assistance in the notes relating to matters of physical science, and to the astronomer Lohrmann in those concerning the stars and their times. But this was not the only assistance he received. He called upon other friends for aid they were pleased to render. Before the translation was given to the public it was carefully revised; and at stated times the Prince would summon to his rooms a company of literary men, to whom he would read a bit of his work for the purpose of receiving their criticism upon it. Among those who were present at these readings were Tieck, Förster, and our own countryman, Mr. Ticknor. The relations between Mr. Ticknor and the Prince were intimate. They were correspondents for some thirty years; there were few friends to whom the King was more attached; and of late years the picture of Mr. Ticknor has hung over his desk in his inner private working-room. The life of a king, even of a king dispossessed of power, is not one in which there is likely to be much room

for studies that withdraw one from practical concerns. In his later years he regretted the giving up of his earlier pursuits. He complained of the decline of literary taste and inclination. There was no literary society left in Dresden. Times were changed since the days when he was busy with Dante. Now men cared only for war and physical science. Philosophy in its higher sense was extinct in Germany.

LESSONS OF THE FRENCH REVOLUTION.*

I.

IN 1789, the National Assembly sat at Versailles making a constitution for France. In 1873, a National Assembly is again sitting at Versailles engaged in the same occupation. In 1792, France destroyed her monarchy and established a republic. In 1873, France appears on the point of destroying her republic and recalling the representative of her ancient kings. These are big salient facts, and, from their paradoxical nature, attract an even undue amount of public attention. It is at any rate natural, if not philosophical, to conclude that the revolutionary efforts of eighty years have been in vain, and that the French people are retracing their steps to the point whence they started in 1789. This is one of those occasions on which a crowd of English writers are certain to moralize on the misfortunes of their neighbors. One author reproaches the French for not having founded a constitution on the model of that of England. Another points out that the calamities of France have arisen from the love of equality. A third traces her ruin to the opposition between the feelings of Paris and the sentiments of the provinces. English critics, in short, with one accord, assume that the French Revolution has totally failed, and thrust forward an explanation of its failure, just as in 1862 English critics were convinced that the American Union had broken to pieces, and explained, in most philosophical language, the causes which made a break-up of the Union inevitable. The Union, as a matter of fact, did not go to ruin, and it would be well if educated Englishmen, who lectured glibly ten years ago on the cause of American ruin, should learn by experience to be a little less ready to deliver homilies over French calamities, which, great as they are, may after all not turn out absolutely irreparable. Lord H. Ormathwaite's work is a feeble and somewhat Pharisaic sermon over the errors and misery of France. It is written with the twofold and not very consistent object of eulogizing the Bonapartes, and of proving that, "had the French been contented to follow the example of England, they had all the materials with which to construct the durable constitutional monarchy, composed, as ours was, of the monarchical, aristocratic, and democratic elements in due proportion to each other." As his lordship never gives any proof that these materials really existed, or affords any real explanation of the reasons why the French did not make use of their supposed advantages, we cannot say that his book effects much towards explaining the course of French politics. Its chief singularity consists in the proof which it gives that an educated Englishman may, with all the experience of eighty years to guide him, look at the Revolution from the point of view which was naturally occupied by Burke, and after all see less far into its nature than did the author of the 'Regicide Peace.' The 'Lessons of the French Revolution,' in short, teaches to our mind scarcely any other lesson than that conservative platitudes which we had supposed to have fallen into disuse, still exert considerable influence over gentlemen educated enough to write them down and ill-informed enough to think them worth publication. The book, however, and others of the same class, derive an interest from the questions they suggest without even giving them an answer. Lord Ormathwaite, and authors of greater ability than he, assume expressly or tacitly that the French Revolution has ended in failure. There is a good deal in the circumstances of the times which suggests this conclusion, whilst there are considerations which make it difficult to adopt this conclusion without reserve. The two enquiries which force themselves upon the mind of any one who considers the condition either of France or of Europe are—first, Has the Revolution failed? secondly, What are the nature and causes of at any rate the appearance of failure?

The grounds which suggest that the Revolutionary movement has missed its mark lie on the surface, and arrest the notice of English and American critics. The immediate object of every Revolutionary leader, from Mirabeau to Robespierre, was to establish the freedom of France. They all were, like Danton, willing enough to do acts by which their reputation might be tarnished, but they all, like him, supposed that by their policy they secured that France should be free. This end has indubitably not been attained. The government of the Duc de Broglie is certainly not the kind of government which any statesman meant to found, and we all know that it is quite on the cards that the government of the Duc de Broglie may be succeeded by exactly that rule of monarchical despotism, supported by priestly bigotry, which all the heroes of the Revolution thought themselves destined to destroy. Nor does the mere failure to found popular government in France measure the whole extent to which the Revolution may be held to have missed its mark. The Legitimist restoration, even should it take place, may probably be a merely transitory phenomenon in French politics. The revived influence of the priesthood is a far more permanent fact, and would seem to any Liberal of 1789 an infinitely more disappointing result of the Revolutionary struggle. All the efforts of the eighteenth century were directed to the spread of enlightenment and the destruction of superstition, and now, when we are approaching the end of the nineteenth century, France may appear to be considerably more superstitious and less enlightened than a hundred years ago. The pilgrimage to Lourdes, the support given by the French Government to all the pretensions of the priesthood, are signs of a state of opinion which would have seemed almost incredible to Voltaire or Rousseau. They and their disciples, one and all, assumed that the power of superstition was, if not dead, on the point of death. They all believed that France was the country destined to give the last blow to priestly tyranny; and of all the predictions which would have seemed to them impossible of fulfilment would have been the prophecy that France should become the last support of the Papacy. If the matter be looked at from a somewhat different point of view, the failure of the Revolution seems even more conspicuous than when you look at the political condition of modern France. The very principles on which the Revolutionists relied have fallen into discredit. All the grand maxims or platitudes which make up the declaration of the rights of man seem to have lost their magic power. The very name of a republic was at one time sufficient to cause excitement throughout Europe. It now is a name with which men can no longer be either charmed or terrified. The French may establish a republic if they like to do so, and no monarch will interpose to prevent them. But if the republic is established, it will be in all probability as humdrum and, so to speak, as commonplace a form of government as any of the constitutional monarchies existing in Europe. Its establishment excites no opposition from monarchs, because it arouses no enthusiasm among their subjects. The grandiloquent maxims and sentiments of the Revolution have suffered a good deal from the errors of their authors, but they have suffered still more from the searching criticism to which for more than eighty years they have been exposed. Any tyro in political philosophy can now expose the fallacy underlying the doctrines of the social contract. Any one who thinks it worth the trouble can point out the errors involved in the assumption that men are born equal, or that the will of the people is the necessary source of sovereignty. The words Liberty, Equality, and Fraternity are still to be seen put up on the public buildings in France. They are a sort of official intimation that France is still a nominal republic. But they no longer stir the feelings even of the multitude. They resemble the formal statement on coins that the English Queen rules *Dei gratia*. This formula had once a definite and important meaning. It now is an historical formula, and nothing more. Suppose, then, for a moment that Mirabeau or Danton could arise from the dead and see the result of his labors. He would find that France is not free, that kings are still powerful, that nations are still superstitious, that the Roman Catholic priesthood hold doctrines which even the priests of 1789 would have called superstitious and yet have acquired a new lease of power, that the grandest maxims of the Revolution have been discredited by critics and hardly command the belief of the populace. His first, if not his last, impression would certainly be that all the heroism, the struggles, and daring of the Revolution had been in vain. He, like modern English critics, would pronounce the greatest effort ever made for the promotion of freedom to have ended in failure.

There is, nevertheless, another side to the picture which is constantly overlooked by Englishmen or Americans. The Revolutionary movement in France is only a part of a great change influencing the whole of the civilized world. This general Revolution, which dates rather from the Declaration of Independence than from the assembling of the States-General, has not yet nearly run out its course. You can no more measure its results by looking solely to the condition of France than you could have determined whether the Reformation had succeeded or not by looking solely to the condition of French Protestantism after the Revocation of the Edict of Nantes. To this must be added, that no great movement which the world has seen has ever produced exactly the result which was looked for by its original authors. No body of men, for example, ever produced greater effects by their labors than did the Pilgrim Fathers; but if the crew of the *Mayflower* could revisit Massachusetts, they would be perplexed to find in modern Boston the realization of the political and religious ideal in search of which they crossed the Atlantic. But when due allowance is made for the extent to which every great movement frustrates the hopes of its originators, it must, we conceive, be admitted that the general Revolutionary movement has not failed of some

* 'Lessons of the French Revolution—1789–1873. By Lord H. Ormathwaite.' London: Richard Bentley & Son.

very marked success. The substance of the Revolutionary doctrines has again and again been obtained when the forms in which these doctrines have been expressed have become discredited. Thus, no dogma has been more attacked than that of the sovereignty of the people, and Lord Ormathwaite, in common with the school to which he belongs, notes a belief in this dogma as one of the special errors of the Revolutionists. The theoretical objections to the doctrine are easily enough perceived. In practice, however, the sovereignty of the people, or something very like it, has become a received axiom throughout Europe and America. Thus, in England no one ever maintains in fact that an institution or law can be permanently supported which runs counter to the deliberate convictions and wishes of the vast majority of the people. Even in states like Prussia or Austria, where the power of the crown is undoubtedly much greater than it has been for nearly two centuries in England, a tacit if not expressed deference to the will of the nation forms part of the doctrine of government. No minister has, in a certain sense, defied the voice of the people so vigorously as Bismarck, yet any one who examines his career will see that the source to which the great German statesman owes his strength is that he has sought the objects which command the strongest sympathies of the whole German Empire. The dogma of popular sovereignty may be denied, but respect to the will of the nation is the rule to which all modern governments, except the Government of France itself, make their policy conform.

In nothing, again, have the Revolutionists in appearance more completely failed than in establishing the equality of mankind. Yet even here the failure has been, perhaps, rather apparent than real. The teachers who wrote or harangued about the equality of man had before their eyes a society which, originally founded on feudalism, exhibited the most marked distinctions of classes. Any student who wants to realize the condition of Europe, say a century ago, should examine the state of Switzerland. The small Swiss republics kept up all the distinctions of classes which had gradually been more or less broken down throughout the rest of Europe. One canton might be a little more liberally governed than another, but wherever the observer looked he would find distinctions of rights depending upon distinctions of birth. Small oligarchies ruled the towns, the towns tyrannized over the country districts, and the greater cantons held the smaller in subjection. Inequality was everywhere the rule. The proclamation of human equality was in effect a protest against a system based on the inequality of classes. The protest has done its work. Such a condition of things as was to be found in Switzerland is now to be found in no corner of Europe. Let any one consider how impossible it would be at the present day to introduce into any civilized nation the rule that the nobility and clergy should be free from the payment of all direct taxes, and then remember that this rule prevailed in France down to 1789, and he will realize that even the doctrines of equality have not been preached in vain for the last eighty years. Nor, again, has the Revolutionary movement really failed in effecting the spread of what was known in the last century as enlightenment. Persons who are astonished at the revival of superstition and the increase in the claims, if not in the power, of the Catholic priesthood, are apt to forget the immense progress made throughout Europe in establishing that freedom of opinion and liberty of discussion which, in the long run, are absolutely fatal to priestly domination. The progress that has been made may be measured by observing how entirely impossible it would be to repeat in any country in Europe transactions which took place as it were quite naturally during the last century. No existing government could hinder, or would think of hindering, the publication of a work such as the famous 'Encyclopædia.' There is not to be found a state in Europe where the tragedy of Calas, or one in any degree like it, could take place. It is safe to publish in Rome itself works which eighty years ago would have exposed their author to prosecution in England. The judge and jury who could scarcely bear with calmness to hear Tom Paine's so-called blasphemies read out in court would have found it hardly possible to look with toleration on works, such as Colenso's criticisms or 'Literature and Dogma,' which now lie on every drawing-room table, and are considered to have rather a religious tendency than otherwise. In many respects, in short, the triumph of what were once termed Revolutionary principles has been so complete that we have ceased to think the principles themselves revolutionary, and underrate the effect of the movement with which they are connected.

Our first enquiry, therefore, leads to a conclusion which, though it may sound paradoxical, is really obvious enough, and is apt to be overlooked only because it is opposed to the prejudices both of extreme Liberals and of ardent Conservatives. The Revolution has, as the best French writers admit, ended in failure, or something very like failure, as regards France herself, and there is too much reason to fear that the fate of France in the 19th century may bear a melancholy resemblance to her fortunes in the 16th century, and that the country which was the apostle of the Revolution may fail in establishing her own freedom, just as the country which was all but the leader in the struggle to reform religion failed in freeing herself from the domination of Rome. But as regards Europe generally, the Revolution has neither failed nor seems likely to fail. Its essential doctrines have spread far and wide, even where the forms in which these doctrines were expressed have been rejected. The question, however, remains, how it has happened that France has failed in her efforts to establish anything like rational freedom. This enquiry is so curious in itself that it deserves separate consideration.

Oldport Days. By Thomas Wentworth Higginson. (Boston: J. R. Osgood & Co. 1873.)—The announcement immediately below the author's name that the ten heliotype illustrations are from views taken in Newport, R. I., expressly for this work, at once dispels the slight mystification of the catch-title. In so doing, it reveals perhaps too much. These essays, many if not all of which had already appeared in the *Atlantic*, find in Newport only a feeble *nexus*. Five only out of the ten can be fairly said to relate naturally and directly to Newport, while the other five—"An Artist's Creation," "Madame Delia's Expectations," "Sunshine and Petrarch," "A Shadow," and "Footpaths"—have no necessary connection with the place. It is only by reference to the essayist himself that the real unity appears. This notwithstanding, and in spite of a certain thinness in the matter, 'Oldport Days' will generally, we imagine, be found entertaining.

As a novelist, Mr. Higginson was already well known, and we need not detain ourselves with his "Haunted Window" or "Madame Delia's Expectations," of which the gaiety of the one cancels the gloom of the other. As a poet, however, he has less frequently appeared in print, and we have read with interest and attention the versions now put forth of a dozen or so of Petrarch's sonnets. After carefully comparing them with the originals, we feel obliged to say that we get more of Mr. Higginson than of Laura's lover. As accident or faulty judgment would have it, he puts in the forefront the very poorest of his efforts—Sonnet 129. The first line, for instance, is but half a rendering of the Italian:

"O joyous, blossoming, ever-blessed flowers!"

It says nothing of the lucky grasses, the "ben nate erbe," equally with the "Lieti fiori e felici" the object of the poet's apostrophe and envy. The plain which, according to Petrarch, preserves some vestige of Madonna's lovely footstep, according to Mr. Higginson

"—— hold'st her memory in thy leafy bowers."

In the next line the "spring-time" implied in *acerbe* is properly enough expressed, but its repetition immediately afterwards—

"And spring-time's pale and tender violets"—

conveys the false impression that the repetition is Petrarch's also. The same defect, we may here point out, recurs in Mr. Higginson's Sonnet 223 ("Qual donna attende"), which we have marked as one of his best:

"There learn *soft* speech, beyond all poet's skill,
And *softer* silence, and those holy ways."

Petrarch applies no epithet to "speech," and would certainly not have chosen "soft"; while "softer silence" really stands for *'l bel tacere—le beau silence,* or Laura's gift of holding her tongue at the right time. On the other hand, where Petrarch himself repeats, Mr. Higginson has been at needless pains to vary the form. Thus, in the same sonnet, the phrase "Ivi s' impara" ("There thou mayst learn") occurs twice, and is caught up again at the close in "Non vi s' impara," which is here rendered "This none may copy," instead of, more naturally, "Thou mayst not learn," or "Mayst not learn there."

But to return to No. 129. Such blemishes as "*your* towers" for "thy" (spoken of a grove), and "can" for "canst" (joined by "and" to "mirrorest"), have been strangely overlooked in this elaborated version. Finally, the last three lines of the sonnet are neither faithful nor felicitous. Our author is, indeed, seldom notably successful with the climax of the sonnet. In 191:

"O stream too bright to grieve!
Why can I not float with thee at thy call?"

is a weak perversion of:

"Che non poss' io cangiar teco viaggio?"

—"Why can I not exchange courses with thee?" And in general, it must be said of Mr. Higginson's paraphrases that they too often rob the original of its vigor, often strangely overload it with his own conceits, or even obscure the sense altogether. We might have instanced in 129 the translation of *ascolti* (givest ear to) by "*keep'st* her words *for amulets*"; but we will conclude our fault-finding with a few connected examples from 123 ("I' vidi in terra"):

"I once beheld on earth celestial graces,
And heavenly beauties scarce to mortals known,
Whose memory lends nor joy nor grief alone,
But all things else bewilders and effaces.
I saw how tears had left their weary traces
Within those eyes that once *like sunbeams shone*,
I heard those lips breathe low and plaintive moan,
Whose spell might once have taught the hills their places."

For the sentence first italicized, the Italian reads: "Since all I see seems dreams, and shadows, and smoke." In the second case, Laura's eyes did not shine "like sunbeams," but "a thousand times they had filled the Sun with envy." The last line is simply incomprehensible as a version of

"Che farian gir i monti e stare i fiumi"

—"Which (*i.e.* the "moan," not the "lips") would make mountains move and rivers pause."

Here, however, is Mr. Higginson at his best, and with this we take leave of him (Sonnet 261: "Levommi il mio pensiero"):

"Dreams bore my fancy to that region where
She dwells whom here I seek, but cannot see.
'Mid those who in the loftiest heaven be
I looked on her, less haughty and more fair.
She touched my hand, she said: 'Within this sphere,
If hope deceive not, thou shalt dwell with me:
I filled thy life with war's wild agony;
Mine own day closed ere evening could appear.
My bliss no human brain can understand;
I wait for thee alone, and that fair veil
Of beauty thou dost love shalt wear again.'
Why was she silent then, why dropped my hand
Ere those delicious tones could quite avail
To bid my mortal soul in heaven remain?"

A Sketch of the Life and a List of some of the Works of John Singleton Copley. By Augustus Thorndike Perkins, A.M. (Boston: Privately printed: 1873. 4to, pp. 144.)—This book derives its main interest rather from the list than from the memoir, as the latter is but an abridgment for the most part of the life in Allan Cunningham's well-known book. No importance attaches to Copley's pedigree, whether we hold with Burke that the father of the artist was an Irish squireen, or with Hinman we note that there were Copleys in Connecticut of traditionary repute as painters. It is certain that Richard Copley of Boston, whose widow, Mary (Singleton) Copley, administered on his estate in 1748, would have dropped for ever out of mind but for the lucky fact that he left behind him a son, John Singleton, then aged some ten years. In a review of the Exhibition in 1811, a London critic wrote that the father of the artist was parish clerk at Salem. He was undoubtedly a tradesman in Boston, and possibly not a very successful one. His widow seems to have married soon, but at all events she was wedded, May 22, 1748, to Peter Pelham of Boston. Pelham was an artist of considerable ability, a very good engraver, and was an emigrant from London who had resided some twenty years among us. He lived for three years and a half after the date of this marriage, and had one son by Mary Copley.

It is not idle to suppose that Copley derived the rudiments of his art from Pelham. The latter could draw, paint, and engrave, and was therefore able to give all the instruction a boy of fifteen could receive. Pelham published a number of very good mezzotint engravings of the resident clergymen, and in 1753, two years after Pelham's death, Copley published in the same style the portrait of Rev. William Welsteed, signed "J. S. Copley, pinxt et fecit." Copley was, then, no prodigy, but simply an admirable example of the success obtainable by native ability well grounded in the essentials of the art, and imitative solely of nature. It must also be remembered that in drawing and painting portraits the lack of academic instruction would be least perceptible. The portrait-painter is always making variations of one theme, and each picture is a source of instruction in a limited field. It is enough praise to give Copley to say that he pursued his art with industry and intelligence, and that his careful study of nature was rewarded by the power of reproducing his subjects with vigor and grace.

From 1753 to 1774, Copley delineated the faces and figures of his contemporaries with a constantly increasing success in fame and fortune. His after-life belongs rather to the history of English art than of our own, and need not here be discussed. The record of his twenty years of American art-life has been investigated by Mr. Perkins with the results detailed in this volume. The book is a list of about three hundred pictures, arranged according to the names of the persons depicted, in alphabetical order. The greater portion of the pictures have been examined by Mr. Perkins; the remainder have been described by the present possessors. The descriptions of the pictures have a somewhat quaint appearance, as they give the details of the costume and accessories; yet there is little more to be said of any portrait beyond general criticism, and in this case the particularity of the description affords the means of future identification of the pictures. Mr. Perkins has performed most acceptably the task of collecting information in regard to Copley's pictures. Of course there are a few errors and more omissions, all of which can be corrected in another edition. But the main fact remains that he has shown us not only the industry of the artist for twenty years, but the more satisfactory proof of the preservation in this country of so many interesting portraits. So many art-critics are content to give their impression upon inspecting one or two pictures, that it is pleasant to find such an example of patient industry in the accumulation of materials for the history of an artist. We not only respect Mr. Perkins's zeal in cataloguing, but we shall be prepared to confess the value of his judgments when we reflect that he has carefully examined more of Copley's pictures than any other living critic.

It is, of course, impossible to give any description of the contents of the book; but we will mention the names of a few of the more distinguished patrons of the artist: John Adams, John Quincy Adams, Samuel Adams, Thomas Amory, Rev. Nathaniel Appleton, Judge Samuel Barrett, Gov. James Bowdoin, Gen. William Brattle, Rev. Samuel Cooper, John Singleton Copley, and many members of the family, including his son, Lord Lyndhurst, Thomas Fluker, Gov. Moses Gill, Harrison Gray, Thomas Hancock, John Hancock, Rev. Edward Holyoke, Nathaniel Hurd, Gov. Thomas Hutchinson, Henry Laurens, Judge John Lowell, Judge Nymphas Marston, Peter Oliver, Andrew Oliver, *Col.* James Otis, Lady Pepperrell, Josiah Quincy, Samuel Quincy, Paul Revere, Judge Richard Saltonstall, Sir Roger Sheaffe, Sir John Temple, Gen. Joseph Warren, Brook Watson, Sir John Wentworth, Judge Adam Winthrop, and George Washington. Certainly this is a famous list of worthies to be painted by one artist, and we repeat that our thanks are due to the chronicler who has made public the existence of these invaluable illustrations of our national history. As regards Copley's rank as an artist, there need be little dispute. He was not only almost the first in point of time in New England, but he still remains at the head of the list in merit. It is, moreover, no national vanity which makes us consider his name as one of the ornaments of the Royal Academy. He earned his position there in a competition with the giants of the English school, and his fame will probably be as enduring as that of any of his associates. His highest repute is as a portrait-painter; and we may esteem it a fortunate chance not only for ourselves, but for the artist, that so great a portion of his life was spent in the study of nature. Had he lived in London, he would probably have adopted the prevailing fashion, and wasted on frigid allegories and ambitious historical pieces the talents which have preserved for us the great men of our Revolutionary period. As the matter stands, his fame, at least in America, grows from year to year, and we shall be much surprised if this book of Mr. Perkins's be not an important aid in extending and increasing it.

Foods. By Edward Smith, M.D. (New York: D. Appleton & Co. 1873.)—This volume is one of the international scientific series now in process of publication under the superintendence of Prof. Youmans. The author tells us in his preface that it has been his object to produce a work "which should embrace all the generally known and some less-known foods, and contain the latest scientific knowledge respecting them, whilst at the same time the subject should be treated in a popular manner." In this last particular the book must certainly be considered a success, for it contains a clearly written description of all the principal articles of food in use among civilized nations, including modes of cultivation, methods of preparation by cooking, and rules for the detection of adulterations. For descriptive purposes, foods are divided by Dr. Smith into *solid* and *liquid* foods, a rather primitive mode of classification, which has the disadvantage of separating such closely allied articles as milk and butter. It is moreover not very strictly adhered to, for we find honey and molasses described amongst the solid foods. The last part of the book is devoted to gaseous food, *i.e.*, atmospheric air, a substance not usually regarded as a food, but which naturally finds its place under the comprehensive definition adopted by the author, viz., "a substance which, when introduced into the body, supplies material which renews some structure or maintains some vital process." The style throughout is easy and readable, and the dryness of the descriptive portions is relieved by extracts from cookery-books of the fourteenth century, and by a scene in a police-court illustrating the effects of alcoholic liquors.

Dr. Smith has, unfortunately, not been equally successful in giving us "the latest scientific knowledge" respecting the various articles of food. The principal scientific data of the volume are the author's tables, originally published in 1859, showing by the graphic method the effect of various sorts of food on the respiration, and Frankland's observations on the combustion-warmth of various nutritious substances. Many important contributions made during the last few years in the Munich Laboratory and elsewhere to our knowledge of the physiology of nutrition are scarcely even alluded to; though this is the less to be regretted, since our estimate of the nutritive value of any given food must, after all, in the present state of science, depend chiefly on the result of long practical experience. It cannot be supposed, however, that it was a recognition of this fact which led the author thus to ignore recent investigations; for the tendency, manifested through-

out the work, is rather to exaggerate than to undervalue the importance of scientific data. Thus, we find conclusions drawn as to the nutritive value of foods from their effect on the excretion of carbonic acid, though, in the present state of our knowledge of the processes which lead to this excretion, such inferences are hazardous in the extreme.

In a popular treatise one does not, of course, expect minute details of a scientific nature; but from a writer of Dr. Smith's reputation one may fairly demand that such details as he does give shall not be characterized by gross inaccuracy of statement. When, therefore, we are told that the muscles of the heart are not striated; that in bread-making carbonic acid is produced by the change of starch into sugar; and that eighty-seven per cent. of the animal body consists of water, we cannot help feeling that a strange degree of carelessness has entered into the preparation of his work. Although the book will certainly not increase his scientific reputation, it deserves and will undoubtedly meet with an extensive sale, for it contains, in a convenient form for reference, a large amount of information likely to be useful, not only to every practising physician, but to every father of a family, and, in fact, to every one who wishes to know something of the nature of those substances by means of which vital activity is maintained.

A School Manual of English Etymology, and Text-book of Derivatives, Prefixes, and Suffixes. With numerous exercises for the use of schools. By Epes Sargent, author of the 'Etymological Reader,' etc. (Philadelphia: J. H. Butler & Co.)—This is a very good little book. It has, besides the usual array of prefixes, suffixes, and derivatives, words from Anglo-Saxon, Latin, and Greek, a large body of exercises, in which the scholar is set at work investigating, comparing, explaining, and composing. This is surely the true way of studying language—making the lessons as little as possible the work of memory, as much as possible the work of reason, judgment, active energy. The exercises seem to be prepared with skill. It is not quite plain that they would be as good in the hands of a good teacher as the continuous text of Milton or some other classic, with which the whole mind of the scholar might be awakened to continuous interest and effort, but they certainly would be better for a teacher unskilled in etymology; and for every one they have the advantage of bringing up at each lesson just the words which the lesson naturally calls for. The book contains no very profound or subtle philologist's work. It is not like Haldemann's 'Affixes'; but what is done is well done, under the guidance of good authorities, and with sound judgment and caution, as such elementary works should be. There should be an alphabetical vocabulary of all the words. Old scholars and practised etymologists are often worried by a new dictionary which has its words only in etymological groups. What beginner in Anglo-Saxon has not grumbled over Ettmüller?

A preface and introduction contain a brief history of the English language and some other general matter, well chosen for the most part, and well expressed. Some of it, however, needs retouching. There is no objection to quoting Brande and Lord Stanley, and referring to Ernest Adams, G. P. Mason, James Stormouth, and Dr. James Douglas as authorities used along with Scheler, Max Müller, Whitney, and the like. Every man knows best to whom he is really indebted. But we do not quite like the reference to "Dr. Mahn of Prussia," with no mention of 'Webster's Dictionary,' which *is* Dr. Mahn, we suppose, so far as this book is concerned, though Mahn himself would not probably like an absolute identification with the American work. On page 26 we read:

"The number of words in the English language is probably about eighty-five thousand. By actual enumeration of those contained in the best dictionaries, it has been ascertained that 13,330 Anglo-Saxon words (remotely Teutonic), and 29,354 of classical origin (from the Latin and Greek), are now registered."

Instead of the "best dictionaries" it should be said "Johnson's dictionary," for this is M. Thommerel's count of the words in that very venerable but not very copious old book. There will be plenty of boys and girls sharp enough to notice that 13,330 and 29,354 do not make 85,000. There were said to be more than 114,000 words in the Webster of 1864, and if what is called Old English be included, it would be easy now to add 10,000 more. But Mr. Sargent doubtless uses *English* with some critical limitations, and would rightly reject large numbers of this great heap of vocables. On page 23: "We may reason thus: As the act of *binding* precedes the existence of the bond, *bond* is derived from *bind*." That would be very poor reasoning. Things are not named from the order of their creation. The order of derivation should be deduced from the forms of the words, and that suggests in this example, as in so many others, that the noun and verb are from a common root, and not either from the other, Webster or Mahn to the contrary notwithstanding.

We are sorry to see that Mr. Sargent favors the monstrous spelling of the English language which is now in use. He tells his pupils that though it is "puzzling, it gives the origin and history of the words, and we gain by it much more than we lose." He might as well talk of preserving the history of America by never making any new maps and faithfully reprinting old Ortelius for a school geography till the latest generation. Faithful phonetic writing is the foundation of scientific etymology. That the English is not respelt into some system is the regret of all scientific linguists, and the standing reproach of English and American scholars. Has Mr. Sargent never noticed the infinite labor with which Ellis accumulates his huge volumes of evidence to establish the real history concealed in the shell of our spelling? or heard the groans of the Germans over English anomalies? or of the Japanese? or imagined universal childhood reciting its spelling-lesson in that time seen in prophetic vision by President Grant, when all the world shall learn English? As the school-bell takes the place of Webster's morning drum and follows the sun round the world, will not that world then be girt with one unbroken wail?

Poems. By W. D. Howells. (Boston: J. R. Osgood & Co. 1873.)—Mr. Howells having drawn about himself a public which warmly admires his later productions, it is no more than is natural and usual that his earlier ones should be brought into the light, so that his friends may have all there is of their favorite, and see him from as many points of view as possible. This volume of verse, then, contains some pieces written a number of years ago, before Mr. Howells had won an enviable reputation by what he had written in prose, and these earlier pieces are doubtless more numerous than the poems written of late years. Almost all of them, however, the old and the new alike, have something of the qualities which are admired in the author's other productions. The style in general—of which it is not fair to speak first in speaking of Mr. Howells's work, although fairer than it would be in the case of nine out of ten writers, so carefully and successfully does he attend to it—seems to be not altogether equal to that of his prose, his ear for the music of metres and rhythms seeming to be not so good as might have been expected. Though, for that matter, we do not know what very rational ground there may be for inferring that an author who writes smooth and finished prose of a somewhat dainty diction should have the natural, elegant grace of a Longfellow in handling all sorts of metres, however fluent or however rigid. Yet one does at first make the demand. Some of Mr. Howells's metres appear to us to move a little stiffly; and these not his hexameters and pentameters only, nor only one or two rather odd metres which we take to be variations of his own devising, but some which are common to all the poets. Of the more important qualities which shine in our author's prose works—as, for instance, of the easy humor, sometimes slyly keen and sometimes poetical and delicate, which doubtless is his strongest point—there are here plenty of specimens, as, for instance, the fanciful "Little Bopeep," which in its gaiety and prettiness is very taking; while in "Caprice" and "Before the Gate" we have the slyer humor, and the close, observant glance which finds the material for the humorous touch, and the insight which must always in some degree accompany this gift. In these last two poems, also, the neatness with which some feminine mysteries are dealt with may be mentioned as a specific form of the general capacity for humorous observation with which Mr. Howells's stories and sketches have made us more familiar; and equally visible are the refinement and sincere good liking with which women are always treated in Mr. Howells's books. If, besides this, there is in the present volume a certain quantity of what elderly men or unrighteous men would call sentimentality about the sex, youth may probably plead itself as its excuse for this transgression, which certainly has been here committed; as has also a certain amount of sighing and grief. But these latter the author ingenuously confesses to have been, in part at least, done with malice, when care was a stranger to his heart. A few such pieces we believe we should have left out; but doubtless the audience for whom the collection was made would not thank any one who should make such an omission.

"The First Cricket" we had intended to quote as a specimen which seems to us the best of these poems—good enough in its way to be placed beside "Bopeep," with its gaiety of fancy, or beside "Forlorn," imaginatively and delicately sombre—something as Hood's "Haunted House" is. But, as being rather more cheering, if we consider the season of the year, and what impends over us, we take instead something quite equal to that poem—"In Earliest Spring":

> "Tossing his mane of snows in wildest eddies and tangles,
> Lion-like, March cometh in, hoarse, with tempestuous breath,
> Through all the moaning chimneys, and thwart all the hollows and angles
> Round the shuddering house, threating of winter and death.
>
> "But in my heart I feel the life of the wood and the meadow
> Thrilling the pulses that own kindred with fibres that lift
> Bud and blade to the sunward, within the inscrutable shadow,
> Deep in the oak's chill core, under the gathering drift.

"Nay, to earth's life in mine some prescience, or dream, or desire
(How shall I name it aright?) comes for a moment and goes—
Rapture of life ineffable, perfect—as if in the brier,
Leafless there by my door, trembled a sense of the rose."

Evidently Mr. Howells, whether or not he hereafter produces many poems of a high order, will have enough of poetry in store to transfuse with some of the divine light such portions of his work in prose as may be the better for the transfusion.

(LATE HOLT & WILLIAMS),

25 Bond Street, New York.

HARPER'S CATALOGUE. The attention of those designing to form libraries, or increase their Literary Collections, is respectfully invited to Harper's Catalogue, which comprises a large proportion of the standard and most esteemed works in English Literature—*comprehending over three thousand volumes.*

Librarians, who may not have access to a trustworthy guide in forming the true estimate of literary productions, will find this Catalogue especially valuable for reference.

The Catalogue is arranged alphabetically by the authors' names, anonymous works by their titles. The index is arranged by the titles of the books, besides having numerous appropriate heads, each general head being followed by the titles of all works on that subject.

Harper's Catalogue sent by mail on receipt of six cents.

Address HARPER & BROTHERS,
Franklin Square, New York.

DEAN HOWSON'S NEW BOOK.

THE CHARACTER OF ST. PAUL.

Being the Hulsean Lectures for 1862. By J. S. Howson, D.D., joint author of Conybeare and Howson's 'St. Paul.' 12mo, $1 75.

CONTENTS.

I. Tact and Presence of Mind.
II. Tenderness and Sympathy.
III. Conscientiousness and Integrity.
IV. Thanksgiving and Prayer.
V. Courage and Perseverance.

FOREIGN BOOKS Reviewed in the *Nation*, and books in all languages, at SCHOENHOF & MOELLER'S, Importers, 40 Winter Street, Boston.

THE WEEK IN TRADE AND FINANCE.

NOVEMBER 3, 1873.

THE financial situation has steadily improved. The banks have gained largely in legal tenders, and, according to the best information we can get, they now hold about $15,000,000. At one time the amount held by them had fallen off to $5,000,000. The "pooling" arrangement was discontinued on the 1st inst., but the banks still have the right to avail themselves of the use of Clearing-House certificates, which will probably continue for some months to come.

Money during the week has been active at rates varying from 7 per cent. per annum to ¼ per cent. per diem. Commercial paper has moved very slowly, and only the best names have been salable at any rates. The lowest quotation we have heard for paper was 12 per cent., but we judge little if any has been placed at that. Good names have been readily obtainable at 18 per cent. and even higher.

The trustees of the Union Trust Company met on Thursday, and, as stated in the *Nation* a few weeks ago would probably be the case, they voted to increase the capital from $1,000,000, the present amount, to $2,000,000, and to resume business on or before December 1. 25 per cent. of the new capital is to be paid in on or before November 20, 25 per cent. by December 10, and the remaining 50 per cent. at the call of the trustees, after December 1, 1873, upon 30 days' notice.

The failure of Messrs. Hoyt, Sprague & Co. took place on Wednesday, followed on Thursday by that of Messrs. A. & W. Sprague, of Providence. An examination of the assets and liabilities of the two firms, by a committee appointed by the Providence banks to do so with a view to rendering assistance and enabling the latter firm to continue their mills in operation, has revealed the fact that the total liabilities of the Providence house amount to $11,475,443, while their assets are $19,495,247, leaving a surplus of assets over liabilities of over $8,000,000. Besides this, the surplus assets of Messrs. Hoyt, Sprague & Co. amount to $3,700,000, making the total surplus of the two firms $11,700,000. It is sincerely to be hoped that an arrangement may be made with the creditors whereby the Providence firm may continue its business, as, in the event of the stoppage at the mills, thousands of operatives will be thrown out of employment for the winter, and much suffering will ensue in consequence.

There were rumors current on Friday and Saturday affecting the standing of a large dry-goods jobbing-house, but the house will undoubtedly be able to sustain itself, as most of their liabilities are on open-book account, while those in the form of endorsements on paper are understood to be fully provided for. It is a noticeable fact that all the houses among the merchants who have become embarrassed during the present financial disturbance have been extended in business beyond the bounds of prudence, and the great wonder is that so few mercantile failures have taken place; from which we are brought to the conclusion that business has been conducted upon sound principles, and we need have no fear that suspension will be in any way general among mercantile houses.

The Street was surprised on Saturday at the announcement that the directors of the Bank of England had raised the minimum rate of discount to 8 per cent. Saturday being a holiday in London, the raising of the Bank rate created considerable comment, there having been no news received from abroad which would influence the directors in their action. Possibly there may be a storm brewing over the water which may develop itself during the present week.

The stock market has been free from "special features" and the course of prices may be summed up in a very few words. The market remained steady, comparatively speaking, until Thursday, when the Hoyt, Sprague & Co. and A. & W. Sprague troubles brought about a very uneasy feeling, which, on Friday, developed itself into a panic. The market gave way on everything, and on Saturday morning the lowest prices of the "season" were made. Central and Hudson sold at 79¼; Harlem at par; Lake Shore at 57¼; Wabash at 33½; Northwestern Common at 31⅝; Rock Island at 83; St. Paul at 31½; Ohio and Mississippi at 21½; Union Pacific at 14¾; C., C. and I. C. at 16½; Western Union at 43¼; and Pacific Mail at 25. Every small operator in the exchange went "short" of stocks, expecting new and important failures among merchants would send prices down still lower, but when it became known that the merchants had pretty much decided not to fail, and that Claflin was all right, the scramble which ensued to buy back the stocks they had previously sold sent prices up more rapidly, if anything, than they had come down. The advance which followed was equal to 4 per cent. on Central and Hudson; 7 per cent. on Lake Shore; 4 per cent. on Wabash; 4 per cent. on Northwestern Common; and 6½ per cent. on Western Union.

The following shows the highest and lowest sales of the leading stocks at the Stock Exchange for the week ending November 1:

	Monday.		Tuesday.		Wed'day		Thursday		Friday.		Saturday		Sales.

Several railroad corporations, we regret to say, have defaulted in the payment of the interest on their bonds due November 1. Among these, the Kansas Pacific, which is understood to have spent its earnings in building a new line of road, expecting to sell bonds to reimburse itself in time to meet the interest payments on 1st inst.; but the present being a very bad time to negotiate new railroad bonds, and it being impossible to procure money, the Company was forced to let the interest go by default. The Chesapeake and Ohio Railroad Company was unable to provide sufficient funds in time to meet its interest, although one of its directors offered to advance $100,000 in gold, provided the others would provide the balance required—$350,000. As may readily be imagined, bonds on new roads are just now in no demand whatever, while bonds of the old roads are inactive and generally lower.

The gold market has remained steady at about the quotations current last week. The range of fluctuations has been between 108⅛ and 108¾.

The public debt statement for the month of October shows an increase in the debt of about $3,000,000. The market for Government bonds has fallen off in the absence of any considerable demand, while there has been a disposition on the part of Eastern savings institutions to sell, influenced, no doubt, by the probability of many mill hands being thrown out of work, and that consequently a considerable demand will be made upon them for money on deposit.

THE MONEY PANIC.

NICHOLSON'S

SCIENCE OF EXCHANGES,

FOURTH EDITION,

gives full and concise information on all financial questions and the basis of commercial transactions.

Free by mail, price $2 50. 8vo, 220 pages.

"In a little book called 'The Science of Exchanges,' by N. A. Nicholson, M.A., of Oxford, there is packed much more information about coins, currency, prices, money, value, and exchange than it falls to the lot of most men, even of so-called 'financiers,' to know. Cassell, of London and New York, is the publisher."—*N. Y. Paper.*

ECLECTIC MAGAZINE

Of Foreign Literature and Science. $5 a year, 45 cents a copy.

E. R. PELTON, Publisher, 108 Fulton Street, N. Y.

THE GREATEST NEWSPAPER ever published in America is THE TRIBUNE Extra (No. 12), of thirty-two pages, containing a full and connected report of the entire proceedings of the recent session in this city of the World's Evangelical Alliance. Two large editions of this Extra have been exhausted by the demand from all parts of the Christian World, and a third is now ready, from which orders will be promptly filled.

The Extras Nos. 6, 7, and 8, containing in full Henry Ward Beecher's Yale Theological Lectures, and Agassiz's Answer to Darwin in twelve lectures on the Method of Creation, will be sent with the Alliance Extra to any address for 40 cents; and all the above with Extra No. 10, the Report of the Portland Meeting of the American Association for the Advancement of Science, for 50 cents.

The Farmers' Extra, No. 13, just issued, contains twenty-five letters from the special correspondent of The Tribune among the Farmers and Grangers of the West, and gives a faithful and impartial account of the causes, condition, and results of the "Farmers' Movement." Price, by mail, ten cents.

THE TRIBUNE Extra No. 14 (in preparation) will give a full account of the Adventures and Explorations of the Hayden Expedition in Colorado during the season of 1873. Price ten cents.

All The Tribune Extras, Nos. 1 to 14 inclusive, sent by mail to any address for One Dollar. Address

THE TRIBUNE, New York.

The Nation.

NEW YORK, THURSDAY, NOVEMBER 13, 1873.

The Week.

WE have as yet to hear of any newspaper or man of any influence and reputation for financial sagacity who is in favor of inflation. Indeed, one of the most remarkable things about the present crisis is that, though it is taken for granted on all hands that Congress, as soon as it meets, must inflate, the avowed object of every one who speaks or writes on the subject, including the President and Secretary of the Treasury, is to get back to specie payments as soon as possible. It is also a singular fact that the cheaper money gets (it has been lent at 5 per cent. within the past week), and the more greenbacks come into the banks, and so into the circulation again, the louder becomes the cry for another issue of legal tenders. The Chamber of Commerce of this city has now this subject under consideration, and they might do a very good thing by exposing, by the publication of a few simple figures, the absurdity and impudence of the truculent beggars who are now getting ready for their descent upon the Treasury at Washington.

Messrs. W. A. A. Carsey, G. W. Maddox, and H. M. Walton have petitioned the President to call immediately an extra session of Congress, and begin work on the internal improvements which he recommended in his last message, and at the same time issue some legal tenders to set the financial machine in operation again. These gentlemen, however, do not ask it as a personal favor, but as representing the Federal Council of the International Workingmen's Association, and their proposal is of some importance as an example of the kind of appeal that will be made to the Government during the winter. The sum and substance of all the talk one now hears about internal improvements, and "the duty of the Government in this hour of our financial trouble," is simply this, that every large insolvent corporation, and almost every insolvent individual, in the country is going on to Washington, or going to get somebody else to go on to Washington, to get a few greenbacks, or to get a little em ployment on Government work, or to get a small guarantee of bonds; and the Government may as well make up its mind first as last that the alternative before it is to pay everybody's debts or pay nobody's.

The Pennsylvania Reformers are having a fight with their Ring almost as important as the struggle with Tweed, in this city, two years ago. The Ring is determined to prevent the adoption of the constitution, and the Constitutional Convention is determined to prevent frauds in the vote on this question, which takes place next month. For this purpose the Convention passed an ordinance before adjourning that the vote should be taken in Philadelphia under the supervision of a special commission, and not under the Ring registry law. It seems hardly credible, but it is nevertheless a fact that the Ring have got Chief-Justice Read to write a letter declaring the act of the Convention illegal. The Pennsylvania Assembly, it seems, undertook to pass an act imposing certain limitations on the Convention, one of which was that the vote on the amended constitution should be taken under the Registry law. If the Assembly can limit the Convention's powers in one way, it can in another, and it follows logically and inevitably that the Assembly can take away all power from the Convention, and, in that way, from the people, and, in fact, pocket the State of Pennsylvania, and do whatever they please with it. This question about the powers of constitutional conventions has arisen a dozen times in American politics, and it is in reality a practical question, and not a legal one. The Secretary of State says that he shall disregard the constitutional ordinance in issuing election notices, and affairs seem to be in a very critical condition.

The case of the Bank of England forgers has had a curious sequel. It will be remembered that in March last the head of the gang, George Macdonnell, was arrested on board the *Thuringia* as she was entering this port, and, greatly to the surprise of the counsel of the Bank of England, was found to have nothing of value in his possession. The arrest was made by Captain James Irving and Officer James Farley of the detective force; and these two officers are now being tried by the Police Commissioners for having secured and appropriated the proceeds of the forgery which it was expected would be found on the person of Macdonnell. From the evidence in the case these facts are clear: For the purpose of arresting Macdonnell, the New York counsel for the Bank—Messrs. Blatchford, Seward, Griswold, and Da Costa—had secured the services last spring of Pinkerton's Private Detective Agency (a rival of the municipal force), when suddenly Irving and Farley appeared on the scene with an order from Inspector Bailey, of the London police. They told the firm very plainly that they, and nobody else, were going to arrest Macdonnell, and, by their threats, secured employment in the case. The firm, however, not feeling very safe, got Deputy-Sheriff Judson Jarvis "deputized" as United States marshal to co-operate with Irving and Farley. The *Thuringia* was boarded by Irving and Farley, but Mr. Judson Jarvis was prevented by the quarantine officers in charge from coming on board, and, when he at last did get on the ship, Macdonnell had nothing in his possession.

Mr. Jarvis is of the opinion that while he was trying to get on board Macdonnell was "cleaned out" by the detectives, and some of the evidence points that way. Macdonnell is an old New York forger, well known to the police here; and as he was a man of education, and had capital at his command, it was antecedently probable that he would make any arrangements he could with the police. He has made a confession, in which he says that he telegraphed Irving to meet him first on the *Cuba* and then on the *Thuringia;* that when Irving and Farley appeared on board, and explained to him that they should be obliged to arrest him, he handed to them $17,250 in U. S. bonds, a draft for £500, and a diamond ring worth £400, on the express understanding that it was to be used for his defence in New York; but that, though often requested, they kept all of it, except $6,000 in bonds, which they returned. The detectives deny the whole story, and the evidence is hopelessly conflicting. Indeed, most of the evidence is not in the case at all, for the Police Commissioners, who are trying it, have got an opinion from the learned Corporation Counsel, Mr. Delafield Smith, in which he takes the ground that the confession of Macdonnell must not be regarded at all, chiefly because Macdonnell is a felon. It will be news to most people that the only way to enquire into the character of a public employee, like a detective, is by the aid of the common-law rules of evidence; but then an enquiry into character by Hugh Gardner, Oliver Charlick, and "Hank" Smith, guided by legal opinions furnished by Delafield Smith, the accused being defended by Oakey Hall, is a curiosity in itself.

The labor question is attracting the attention of the authorities in Brooklyn, and a movement is on foot to get the city to spend a hundred thousand dollars in securing "the largest possible relief to the most needy and deserving laborers." The discharge of laborers all over the country seems to be considerable, and it is certainly the duty of those in comfortable circumstances to relieve distress during the coming winter. Issuing town or city bonds is not the way to do it. The money for the loans must be raised by taxation, and the increased taxation will fall next year on the very workingmen who now get the aid, and then more loans will have to be raised in Brooklyn and elsewhere. If any city in the United States wishes to ruin its credit, the way to do it is to get some enterprising broker to market a few issues of bonds in aid of the suffering poor.

The trial of Tweed has begun, or rather a beginning has been made of getting a jury for the purpose of the trial. The counsel for the defence at first resorted to the extraordinary device of submitting to Judge Davis a paper suggesting to him that he was biased against the prisoner, and therefore unfit to try the case. This not unnaturally occasioned a little warmth of feeling, and on a subsequent day a disgraceful scene occurred, in which that distinguished jurist, Mr. Wm. O. Bartlett, having been told that a point was decided, and that the Court wished to hear no more argument upon the matter, requested to know whether he might not cite a case; on being asked what case he had in mind, he began with some distant allusions to the late Chief-Justice Chase, apparently meaning to draw a moral from Mr. Chase's politico-judicial career for the benefit of Judge Davis; but he was again told to sit down. The difficulty of getting impartial and at the same time highly intelligent jurors for such trials as this was well illustrated on Monday in the case of Mr. Daniel Bradley. Mr. Bradley, who had been drawn as juror, was a citizen for seven years of Tweed's ward (the Seventh), by occupation a stable-keeper, and about thirty-five years old. He testified that he had formed no opinion as to Tweed's guilt; should not know him (here he pointed at Tweed himself, who was in court) "if he was sitting right there"; had heard plenty of talk about Tweed, but had enough to do to mind his own business without forming opinions; did not know whether he had ever voted for Tweed, for he had generally voted the Democratic ticket straight, apparently without knowing the names on it; had heard that Wm. M. Tweed and Green (the Comptroller) were "engaged together in frauds," and "didn't want to get on the jury a bit." His answers caused a great deal of merriment, and he was challenged peremptorily by the prosecution.

No explanation has as yet been given of the $187,000 illegally deposited by the Secretary of the Treasury with the First National Bank of Washington, and lost in the panic on the bank's failure. It is now said, however, that the Secretary, frightened at the noise made in the newspapers on the subject, induced Jay Cooke & Co. to deposit securities with the Government to the amount of $200,000, thus making the Treasury safe. Where Jay Cooke & Co. got this money, no one seems to know, as the firm are insolvent, and making terms with their creditors; and the creditors of Jay Cooke & Co. and the First National Bank, who find the Government treated as having a preferred claim, are naturally alarmed. Altogether, it is a very mysterious piece of business, and one which will need clearing up.

The Canadian Opposition has gained a decided victory, and forced the resignation of the ministry. After a long debate on the Pacific Railroad scandal, at the close of which Sir J. Macdonald made a speech in which he defended himself on all sorts of grounds, among others that he had done nothing more than many other ministers both in Canada and out of it, the temper of the House of Commons was so clearly adverse that he suddenly sent in his resignation. A new ministry was at once formed, with McKenzie as Premier, and Parliament was prorogued. It has since come out, greatly to the disgust of the Opposition, that just before retiring the ministry filled a number of vacant offices.

It seems useless, in the present uncertainty as to the facts, to attempt to say exactly what the "case of the *Virginius*" amounts to. The facts known are that, on the 23d instant, the steamer left Kingston, Jamaica, having on board a large number of Cubans and a quantity of war material. She sailed under the American flag and had American papers. The *Virginius* was subsequently overhauled by the Spanish gun-boat *Tornado*, and taken into Santiago de Cuba, where four of the passengers were at once shot, according to official dispatch to the Captain-General, "for being traitors to their country, and for being insurgent chiefs." Their names were "Bernabe Varona, *alias* Bembeta, general of division; Pedro Cespedes, commanding general of Cienfuegos; General Jesus de Sol; and Brigadier-General Washington Ryan"—the last an old Cuban filibuster and American citizen. Where the *Virginius* was boarded, whether on the high seas or not, is not yet clear, and the matter is already the subject of correspondence and negotiation between the Spanish Government and our own. The Cubans have held an indignation meeting in New York, but sympathy with either side seems to be quite wasted. The Cuban sympathizers are spending their days and nights in trying to embroil this country in a quarrel with Spain, and the Spaniards in return (who cannot govern their own country) are shooting and cutting the throats of the sympathizers wherever they find them. The American Consul at Santiago, it is said, was absent without leave; but he denies this.

Beyond the report of a severe defeat sustained by the Republican troops at the hands of the Carlists, there is little that is new in the affairs of Spain. But it is certain that things improve under Castelar. The army is gaining in discipline and numbers; this may be said without saying much for its present condition, which the continued resistance of the Intransigentes and Carlists shows to be poor at best; but any change for the better gives more certainty about the future. Then the chiefs of the Conservative and Radical parties which divided the old Cortes under Amadeus, have at last decided to give in their adhesion to the Republic *de facto*, as represented by Castelar's dictatorship. The Conservatives have held a meeting in Madrid, at the house of Admiral Topete, under the presidency of Marshal Serrano, at which, without coming to any conclusion about monarchy or republic, it was agreed to support the present government in the restoration of public order. The Radicals met under the auspices of Senor Martos, and made overtures for union of action with the Conservatives, who refused to have anything to say to them; but they then passed resolutions binding themselves to support a republic based on the national unity, the most absolute integrity of the Spanish territory, and the decentralization "established by the constitution of 1869, and to combat by all lawful means within their power the application of the federative system to the Spanish Republic."

The letter of the Comte de Chambord, besides making him an impossible candidate, naturally has had a dissolving effect on the Legitimist majority, and one of its first results was the desertion of a considerable portion of the Left Centre, which had voted with the Monarchists at the overthrow of Thiers, and this now leaves it very doubtful whether they could hold their ground in an open fight in the Assembly. The only piece of comfort which has fallen to them since Chambord's *fiasco* is to be found in MacMahon's message, in which he says the Government must have more power and a more permanent tenure of office if it is to preserve order. He causes it to be understood also that, if the Republic is definitively proclaimed, he will not remain President, though he has no objection to command the army. These declarations and hints have opened up the road to a compromise, by which the Republic is not to be definitively proclaimed, but MacMahon's powers and the present provisional state of things are to be prolonged for five years at least, and which at this writing is likely to be adopted. In this way, the Monarchists obtain a respite, during which they hope "something will turn up," and the Republicans obtain a further chance of familiarizing the people with republican forms, and associating the Republic in the popular mind with order and tranquillity.

Those who are dissatisfied with the present state of things in France, and long for the meeting of a Constituent Assembly to draw up a brand-new constitution, would do well to read Mr. Freeman's paper, in the last *Fortnightly*, on the growth of commonwealths, in which he repeats, and enforces with numerous illustrations, a suggestion made many months ago in these columns, that the government which the French are now building up, piecemeal, as the wants of the hour dictate and as party struggles will permit, is, as long as the work is done peaceably, and in fair parliamentary fight, far more

likely to last and be useful than any "fundamental law" which could be drafted by a Constitutional Convention. In fact, we do not hesitate to say that the majority is rendering France one of the greatest services she has ever received in refusing to dissolve, and thus accustoming the country to the spectacle of constitutional changes, without bloodshed, "manifestations," or "appeals." If constitutions drawn up by "thinkers" on "great principles" could save nations, France would now be the happiest and best-governed country on the globe.

Mr. Richardson's plan of secret resumption, if successful, would be hailed with delight by several other countries which are laboring in a heavy sea of paper money. Austria, France, Italy, and Turkey are all in financial difficulties. Austria has been bearing an irredeemable paper for over twenty years, and is just going through the first panic, produced by the upward turn taken by the Empire after 1866. The establishment of representative institutions in that year, the pacification of Hungary, and the release from Venetia, gave a prodigious impetus to industrial and commercial enterprise, and the progress of the country has since that period been very remarkable; in fact, it may be said to have emerged from mediæval into modern life. The consequence has been a rapid growth of habits of speculation, which the preparations for the great Exposition of last summer stimulated to a deplorable degree, resulting in the panic of last April. That panic was momentarily suppressed by Government making heavy loans, but there was no real recovery. Confidence has been declining all summer, under the spectacle of the commercial failure of the Exposition, and the innumerable financial and banking companies which have sprung up during the last seven years have been gradually going to the wall, and the panic has now broken out worse than ever. It is agreed, on all hands, that these institutions, representing a nominal capital of about $70,000,000, will have to be wound up somehow, and it is proposed to take their shares at their real value, and out of the whole build up one big bank, a process which a syndicate composed of the Rothschilds and two other houses are trying to bring about. Among the other catastrophes of the crisis, and one which will illustrate its nature, is the collapse of thirteen building companies, which were organized to erect buildings on the land reclaimed by the regulation of the banks of the Danube. They bid against each other for lots offered for sale by the Government, broke down in the first panic; then tried to pull through by coalition, and now collapse altogether.

In Italy, the deficit for the current year is expected to reach at least $30,000,000 in a revenue of $260,000,000, and some estimate it as high as $50,000,000; and the debt is $807,472,920, and there is a full supply of irredeemable paper. In France, the situation is fully as perplexing. The Bank of France was, before the war, the greatest and perhaps the most carefully managed in the world. It suspended specie payments after the war, but never had paper enough out to depreciate it sensibly, and gold and paper circulate nearly at par; or rather, the paper circulates nearly at par, for the gold has disappeared. The times, too, are growing bad in France. The indemnity to Germany begins to tell, because the money to pay it was borrowed, and people now begin to feel fairly the burden of the loan; and as all classes are economizing, and the political future is very uncertain, business is bad and grows worse. Applications for discount begin to press on the bank, and it has not money to meet them, and has raised its rate of interest to stave them off. But the necessity of issuing more paper, and thus parting company with gold, stares it in the face, and specie payments recede visibly into the remote distance.

Poor old Turkey brings up the rear among nations in difficulties. She, like a great many gentlemen in this country at the present moment, is laden down with "assets" on which she finds difficulty in "realizing." She has borrowed, between 1854 and 1871, $354,810,000, and we believe the financiers in London and Amsterdam are just now enquiring with some anxiety what has become of the money, and it appears that a very large share of it has gone into palaces, and iron-clads, and jewelry, while no Turkish port possesses a good wharf or public warehouse, there are no roads through the interior, the taxes are farmed out, the total debt is $733,620,000, and there is every year a heavy deficit in the revenue. Another loan is now needed, but lenders have grown wary, so extensive reforms are promised. The Minister of Foreign Affairs writes to London that the Vacouf—real estate belonging to the mosques—is to be "secularized," and sold outright in Constantinople, and throughout the rest of the empire subjected to taxation. The tax on tobacco, hitherto only levied at Constantinople, is to be extended to the rest of the country. The stamp tax is to be collected with greater efficiency, and the public mines and forests leased to the highest bidder, and improvements are to be made in the general system of collecting. Nevertheless, as these are all nothing but promises, the "moneyed mind" still hesitates, and asks for proofs. Whichever way we look in Europe, political finance is in a bad condition, which furnishes another strong argument for our getting out of the slough while we may.

The Japanese Government, to complete its imitation of European civilization, aims at establishing a foreign postal service under the control of its own officials, and has made a convention with the United States, which will likewise be pressed for acceptance upon all the Treaty Powers. This news has been received with anything but favor by foreign residents, who have under their eyes the "abject failure" of the telegraphic and railroad enterprises of the Japanese. The Americans, especially, look with alarm on the proposal to entrust their letters to Japanese officials; and we do not know that their confidence will be wholly restored by the appointment, as superintendent of foreign mails, of "a gentleman whose acquaintance with his duties is best vouched for by the fact that he occupied the 'British desk' in the Post-office at Washington." We have formerly had occasion to point out the low grade of American civil servants in the employ of Japan; and, while we know nothing—not even the name—of the superintendent just mentioned, we venture to think that his nationality does not afford all the assurance which the American, let alone the European, resident requires in the present instance. We are credibly informed that the need of the service first occurred to the Pacific Mail Steamship Company, and that both the agent who negotiated the convention in Japan and the minister who supported him have interested relations with the company. This may or may not be the case; and if it is, it must be admitted that the innovation is only a logical development of the transformation of the Japanese Government, and was sure to be attempted sooner or later. That it will share the unsuccess of kindred experiments, and will for a time inflict a certain amount of damage on foreign interests in the country, is also pretty certain.

The steps which Japan is taking to educate native civil servants, and which consist chiefly in sending them abroad, are not producing the desired fruit. There are some exceptions to the following picture of them which we take from the *Japan Mail*, but it is applicable in the main:

"The majority of these youths come back to their own country with the most imperfect understanding of what they have seen elsewhere, a superficial smattering of two or three 'ologies' or 'isms,' a taste for beef and beer, and a prodigious contempt for their own country. They are insolent to their fellows, ambitious of the notice of foreigners, contemptuous towards the learning and traditions of Japan, and profoundly ignorant of ours. Their minds, which might have been of some use if developed at home, bear the same relation to those of their more regularly educated countrymen who have remained in Japan as gruel does to good solid brain matter. They have not a single well-defined thought or belief, except the conviction of their immeasurable superiority over the general average of their fellows. Their language is euphuistic and absurd. If educated in America, they deliver themselves of the feeblest platitudes on the subject of republican institutions; if in England, they are equally profound in praise of monarchy. Of the working or meaning, of the safeguards or dangers, of the underlying principles, of the advantages and disadvantages, of these two widely different systems, they know no more than a child does of conic sections."

THE PROPOSED SCHEME OF INFLATION.

IT is all but certain that a vigorous effort will be made in the coming session of Congress, not to return to specie payments, but to inflate the currency, and postpone indefinitely a return to specie payments. The West will probably support this plan very energetically, and it will meet, we fear, only a half-hearted opposition from the Eastern members, for the very simple reason that the monetary crisis through which the country is passing has proved so severe that nearly everybody, whatever his general opinions may be on the conditions of sound finance, has an almost overwhelming personal interest in the provision of an immediate escape from the present trouble. Everybody who owes money, or who has investments which have undergone "shrinkage," or the future of which the present stringency has endangered, no matter how honest-minded he may be, or however deeply convinced of the dangers of irredeemable paper, will be himself easily reconciled to a measure which promises to defer the evil day, and to give him a chance of getting rid of his encumbrances before the "grand crash" comes.

The form which the proposed inflation will take, and in which it will be recommended, we are assured, in the President's Message, is already foreshadowed. We have it lying on our table in a dozen printed pamphlets or programmes, and Treasurer Spinner has set it forth with some elaboration in his recent report. Stripped of details and technicalities, the plan is substantially this: That the United States should issue a certain quantity of bonds, bearing interest at $3\frac{65}{100}$ per annum, and should issue an equal quantity of greenbacks, which should be exchangeable for the bonds, the bonds being also exchangeable for greenbacks at par at pleasure of the holders. The theory of the plan is that it would supply the currency with that "elasticity" in which the present crisis has shown that it is wanting, and which is supplied to redeemable currency by the action of foreign exchange. That is to say, when money was plenty, or, in other words, lying idle—in the summer, for instance—the owners, instead of handing it over to the New York banks to be lent by them to brokers for purposes of speculation, would put it into the bonds for the sake of the interest, and then, when it was wanted again in the fall "to move the crops," would draw it out. In short, the Government would, at a small annual cost in interest, supply a machine by which the process of contraction and expansion could be carried on by the people themselves as their wants might dictate. If too much money is afloat, it is argued, it will be taken out of circulation and put into bonds; if too little, the bonds will be used to draw it forth; and, as the history of the greenbacks has shown, currency thus issued and secured will at all times command as much of popular confidence as, if not more than, any redeemable paper ever did. The great defect of our present currency is, it is said, not that it is not redeemable in coin, for the community, we see, values it as much as if it were, but that no power to expand it is lodged anywhere; and it is to the exercise of this power of expansion we must always look, as the history of the Bank of England proves, to prevent or mitigate panics. The "reserve" has never yet prevented one, much importance as some writers attach to it. In fact, in every monetary crisis from which England has suffered, it seems to have served no purpose but to increase the popular terror by the spectacle of its decline.

What, then, are the objections to the proposed plan? If, as many good judges think, we are suffering from a scarcity of legal-tenders, what is the harm of issuing more of them, if we provide the means of natural contraction when they are in excess? The answer to this question is, it seems to us, obvious, and it is an answer which is to be found on every page of financial history. The proposed issue would be inflation pure and simple, and would, in spite of the convertibility into bonds, have all the consequences of inflation. The bonds would, in fact, serve no other purpose than that of supplying the country banks with a place of safe deposit for their unemployed balances during the hot weather, and might thus, in some slight degree, restrain speculation in Wall Street. It would do nothing whatever to prevent or mitigate the fall and winter stringency, and for the simple reason, which all inflationists overlook, *that all issues of irredeemable paper are at once absorbed, irretrievably, by the consequent rise in prices*, and that once they have entered into prices there is no means of extracting them but *forcible* contraction. Suppose we have now $400,000,000 greenbacks afloat, and we add to this $50,000,000 more. The new issue at once raises prices, and thus renders $450,000,000 as necessary to the discharge of the ordinary business of the country as the $400,000,000 were previously. In other words, every man needs $4 50 to produce the result which he had previously produced with $4; and, this process once accomplished, the notion that your $50,000,000 will ever go back into bonds is a chimæra, and one of a very dangerous sort, which has been a hundred times exposed, and which, nevertheless, is continually reproduced as the basis of new schemes of inflation. $5,000,000 or $10,000,000 might possibly every summer, for a year or two, go back to Washington in the dull season, but the quantity would steadily diminish. The pressure of trade on the currency limits would be speedily as great as ever, and the demand for further expansion—that is, for more greenbacks and more bonds—would be as loud in four or five years as now, and would be supported by the same arguments. The phenomena of the financial situation would be the same as now; the fever of speculation, excited by the prospect of indefinite, never-ending inflation, would be higher than it has ever been, and in a very short time we should have to seek relief in a general "wiping out," or, in other words, national bankruptcy.

The use of redeemability in coin, as we all now know, or ought to know, is to keep up our monetary connection with the other civilized nations. To say that foreign exchange may be left to take care of itself as long as our foreign trade amounts to $1,000,000,000 a year and is yearly increasing, and our payments of interest abroad to $100,000,000, is useless. As long as this is the case, the state of the foreign market must be a serious consideration to us. But, in addition to this, it is only through monetary connection with the civilized world that any natural check on undue expansion can be exercised. If we were in proper monetary relations with the rest of the world, or, in other words, if our paper were redeemable in coin, we could not issue too much, or enough to affect prices permanently in our own country; because, as soon as this tendency to a rise showed itself, all persons having payments to make abroad in behalf of those who use foreign goods would begin to contract the currency by exporting bullion; and they would do this, not in the hot weather, or for the pious purpose of preventing speculation, but at all seasons of the year, in the ordinary course of their business; and it is on the conduct of the mass of men in the ordinary course of their business that all sound financial legislation has to be based. Currency, on the other hand, which men cannot contract in the ordinary course of their business by diffusing it over other countries, inevitably and permanently raises prices, and all efforts to prevent it by offering them tempting little investments in Government bonds will prove futile.

What we are saying here is not, we beg our readers to remember, any theory of our own. It is an inference from the experience of many ages and many nations. It is firmly imbedded in financial science, and we most earnestly trust that the thinking people of the country will examine it, and lay fast hold of it, in this most serious juncture, and not be led away by fantastic theories and quack remedies. We stand at the parting of two ways—one leads through some suffering, much of which has been already endured, to as sound a currency as human nature and the physical conditions of human life admit of; the other leads rapidly through several stages of drunken enjoyment to a bottomless pit of repudiation. The adoption of the proposed plan of issuing interchangeable bonds and greenbacks would be an unmistakable choice of the latter. Fresh issues would be called for year after year, and with the same result. Our financial separation from the rest of the world would grow wider and wider; the disadvantages of our producers in the markets of the world, and the consequent difficulty of the profitable exportation of any commodity but bullion,

would become greater and greater; we should consequently have that famous old "balance of trade" perennially against us, and have the Boutwells and Kelleys for ever inviting us to try to turn it in our favor by piling on higher duties, and have them continually telling us, when it would not turn, that it was because American industry was "not sufficiently protected." The story is an old one; it is one of the most familiar now in human experience. We surely can extract some wisdom from it.

THE RESULTS OF "HARMONY AND DISCIPLINE" IN NEW YORK.

TO make inferences from the results of the fall elections in "off-years" as to the general political drift of opinion, is usually unsafe. Since the war, the money and men controlled by the politicians who manage the State governments have been so small in comparison with the money and men controlled by the central power at Washington, that to maintain a continued direction of the affairs of the country, vigorous action once in four years has been quite enough. Provided the country can be induced once in four years to confide the great machinery of the civil service to the dominant party, it makes less difference now than formerly what is done at intermediate periods. Looking back for a period of twelve years, we may see that since the Republican party came into power, there have been ebbs and flows of the tide at almost regularly alternating biennial periods. In 1860, Mr. Lincoln was elected; in 1862, there was a Democratic revival; in 1864, Mr. Lincoln was re-elected by an overwhelming majority; in 1865, there was again a Democratic revival; in 1868, General Grant was elected by a decisive vote; in 1870, there was a "conservative" reaction; in 1872, General Grant was re-elected by an overwhelming vote; and now, in 1873, we see again the movement in the direction of "conservatism" begin which will undoubtedly by next year have attained considerable strength. Whether it will be followed by the usual Republican "tidal wave" in 1876 remains to be seen; but the steady alternation of ebb and flow for the past twelve years is enough to make us hesitate before we draw any very far-reaching moral as to the next Presidential election from this autumn's vote.

Nevertheless, the falling-off in the Republican vote this year has been so unusually enormous that some explanation seems necessary, and the explanation given by the leading Republican organs themselves is a simple one—that of gross mismanagement. Of what sort the mismanagement has been, the canvass in this State has furnished a most conspicuous illustration. A year ago, the grasp of the Republican party on New York seemed as firm as the most ardent partisan could have desired. It had in its control not merely the well-disciplined force of the largest custom-house in the country, but it had the prestige of an overwhelming victory in the Presidential election; and, more than this, it had fortunately allied itself with, and to a very great extent obtained the direction of, the Reform movement—the only really popular movement which had taken place in municipal politics for many years; while at the same time everything gained to the Republicans by the rising against Tweed's Ring had been doubly lost to the Democrats through the long association in the public mind of corruption with the dominance of the Democratic party. More than this, by very skilful manœuvres, the leading Republican politicians freed themselves from any suspicion of alliance with the faction known as Apollo Hall—an organization got up, as every one in the city knew, by a leading Democratic politician of the lowest order, for the purpose of selling its vote to the highest bidder.

Affairs being in this position, what was the true policy for the Republicans to adopt—not to adopt as moralists and children of light, but as children of this world, as politicians endowed with ordinary shrewdness? Obviously, it was to associate themselves so intimately with the Reformers, and manifest publicly such an utter loathing of all corrupt alliances and all bargains and sales of votes, as to convince the solid, respectable, and intelligent part of the community that there was but one way to obtain the fruits of reform—by voting the Republican ticket straight. But this is not the way in which the politicians looked at all. To judge by what they have done, at least, the leaders evidently regarded the party vote as a force which only needed a proper amount of exhortation and intimidation to bring it out, in accordance with a theory of long standing that, no matter what nominations are made, the voter can be made to cast his vote by an appeal to "harmony," and, no matter what scandalous wire-pulling may go on in caucuses and committees, the leaders themselves can be forced to work in harness by the more forcible means of "discipline."

Looking at the matter, for instance, simply as politicians, one would have said that a winning card for the Republicans to have played this year was the renomination of General Barlow. General Barlow's name was one of the chief connecting links between the party and the Reform movement. He had been concerned in the prosecution of the Erie thieves, and was now engaged in the prosecution of the members of the Tammany Ring themselves. He had distinguished himself in the army; his reputation was above suspicion; and, more than all, his name was widely and favorably known. He was eminently a public character. Besides this, it was understood by every one that the dishonest Republican politicians, and particularly the members of the "Canal Ring," were opposed to General Barlow, who had himself written a letter denouncing the principal member of the Ring, Mr. William B. Taylor, as a corrupt and venal man. A child in politics would have foreseen, under these circumstances, that if the managers dropped General Barlow, this letter would unquestionably see the light, be read by every human being in the State, and disgust every human being who read it.

The reason why General Barlow was dropped was the necessity of maintaining what is called harmony. It was the necessity of maintaining "discipline" which led to the affair in the Eighteenth Assembly District in this city—small in itself, but important as an indication of the way things have been going. The Eighteenth Assembly District lies in the upper portion of this city, and is inhabited partly by the class of men who furnished the bone and sinew of the Reform movement—men of wealth, intelligence, and, in the main, taking little or no interest in the game of politics as it is usually played. It embraces a much larger portion of ignorant and easily-controlled voters, who can be "voted" in any way the dominant party pleases. Two years ago, the Republicans having, as they supposed, secured the support of the Reformers of the district, put up as candidate for the Assembly Mr. Bernard Biglin, a man of extremely doubtful antecedents himself, and belonging to a class—that of "professional rowing-men"—which has always been in very bad odor. To set on foot some religious enterprise for the Christianization of the heathen by placing at its head an active gambler, would not be much more singular than to select a "professional rowing-man" as a Reform candidate. These general considerations, however, there was no necessity of applying in this case, for any one who had ever seen Mr. Bernard Biglin knew him to be totally unfitted by cultivation or natural endowments for the position he was called upon to fill. The rich and intelligent voters protested, but they were solemnly assured by the managers that no one but Mr. Biglin would have any chance, and that the discipline of the party required them to vote for him.

A few gentlemen nominated an independent candidate of reputation and ability, and the result showed that the Republicans had quite enough votes to spare to make it a ridiculous absurdity to say that their candidate—commonly known as "Barney Biglin"—was a necessity to the party. The independent candidate secured a very respectable vote, but Barney was elected, and Barney went to the Legislature. What he did there is best known to himself, for he is not a man to distinguish himself in debate; but this year, if it will be believed, he was again nominated, and the most wealthy and intelligent part of his constituents again bolted. This year the independent candidate was Mr. William G. Choate, a man of education, position, and reputation, between whom and Mr. Biglin it would be ridiculous to institute comparisons;

but Mr. Biglin had secured the regular party nomination, and Mr. Biglin must be elected. Party discipline must be maintained at all hazards, and so in the chief Republican organ and chief Reform newspaper appeared paragraphs exhorting the supporters of Mr. Choate to abandon him and vote the straight ticket, arguing, of course, exactly as the case had been argued before, that no one but Mr. Biglin could be elected. The result is exactly what might have been expected. Mr. Biglin is again declared elected; but this year, some queer facts connected with the returns appear. The returns themselves are not made known by the Republican and Reform Police Commissioners till the day after the election, and loud cries of fraud are raised. The knowing Democrats call a meeting of Tammany Hall, and, amid much virtuous indignation, Mr. Oliver Charlick is expelled from the Tammany Committee for connivance at these frauds; so that the result of two years' disciplining of the voters of a single Republican and Reform district is the confirmation of the old suspicion that, no matter how much interest a man of intelligence and education may take in politics, he can effect nothing, and will be defrauded in the end.

As for the alliance made this year with Apollo Hall, we hardly know how to speak of it at all. It is so impossible to understand the calculations on which this alliance was based, that one feels almost inclined to attribute it to the machinations of the malignant European despots who, a few years ago, took such delight in any development in American politics which pointed to "a failure of free institutions." Why any one in the world should have supposed that a bargain with Apollo Hall would enure to the advantage of the party, particularly after its overtures had just been rejected with contempt by Tammany itself, and the alliance had been declined the year before on high moral grounds, we cannot imagine. But, whatever may have been the origin of the delusion, the alliance was effected, and, the alliance having been effected, party "fidelity" required that the ticket should be swallowed. Down to the very last day before the election, the *Times* was exhorting its readers to vote for the ticket as a whole, not because it approved of the alliance with Apollo Hall, or the rejection of General Barlow, but for the sake of "discipline" and "harmony."

And now the din of battle is over, the vote has been polled, and the Democrats have carried the State and the Senate; and on turning to the columns of the newspaper to which we have just referred—the same newspaper which advised the voters of one of the most important districts in the State to vote for "Barney Biglin," for the sake of "harmony," and swallowed the rejection of Barlow and the nomination of Taylor as a matter of "discipline," and exhorted Republicans to vote the straight ticket after the alliance with Apollo Hall for the sake of "harmony" and "discipline" together—what does this newspaper say? It says that the defeat of its party was due to these causes—putting up "all sorts of candidates" for office, and trusting to the "party papers" to "pull them through"; leaving "the management of the party in New York in two or three hands" of such a character that the *Times* does not like to mention them by name; and the alliance with Apollo Hall. We might add some reflections of our own on the queer reputation for extraordinary shrewdness which our politicians have managed to acquire, and the evidence of this shrewdness shown in the result of this election, but they are reflections which "make themselves."

THE ODIUM PHILOLOGICUM.

OUR readers and those of the *Galaxy* are familiar with the controversy between Dr. Fitzedward Hall and Mr. Grant White, of which Mr. White announces the close, so far as he is concerned, in our issue of to-day. When one comes to enquire what it was all about, and why Mr. White was led to consider Dr. Hall a "yahoo of literature," and "a man born without a sense of decency," one finds himself engaged in an investigation of great difficulty, but of considerable interest. The controversy between these two gentlemen by no means brings up the problem for the first time. That verbal criticism, such as Mr. White has been producing for some time back, is sure to end sooner or later in one or more savage quarrels, is one of the most familiar facts of the literary life of our day. Indeed, so far as our observation has gone, the rule has no exceptions. Whenever we see a gentleman, no matter how great his accomplishments or sweet his temper, announcing that he is about to write articles or deliver lectures on "Words and their Uses," or on the "English of Everyday Life," or on "Familiar Faults of Conversation," or "Newspaper English," or any cognate theme, we feel all but certain that we shall soon see him engaged in an encounter with another laborer in the same field, in which all dignity will be laid aside, and in which, figuratively speaking, clothes, hair, and features will suffer terribly, and out of which, unless he is very lucky, he will issue with the gravest imputations resting on his character in every relation of life. We have seen so many illustrations of the tendency of these attempts to improve popular speech to end in vituperation, that we have felt ourselves obliged, in the interests of peace, to exclude them from our columns, and even to decline answering the enquiries of correspondents on nice points of grammar or usage. Our late contemporary, the *Round Table*, having less regard for public order, or greater love of sensation, at a very early period in its brief life engaged the services of a professional word-critic of the name of George Washington Moon, who was then fresh from a very ugly encounter with Dean Alford. The result was a series of rows, in which Moon was compelled to tell several of his adversaries his low opinion of their morals and manners, and in which they repaid him in kind. We might multiply these cases almost indefinitely. If they were collected, they would form a melancholy and yet somewhat amusing appendix to the 'Quarrels of Authors.'

Now, why is it that attempts to get one's fellow-men to talk correctly, to frame their sentences in accordance with good usage, and take their words from the best authors, have this tendency to arouse some of the worst passions of our nature, and predispose even eminent philologists—men of dainty language, and soft manners, and lofty aims—to assail each other in the rough vernacular of the fish-market and the forecastle? A careless observer will be apt to say that it is an ordinary result of disputation; that when men differ or argue on any subject, they are apt to get angry, and indulge in "personalities." But this is not true. Lawyers, for instance, live by controversy, and their controversies touch interests of the gravest and most delicate character—such as fortune and reputation; and yet the spectacle of two lawyers abusing each other in cold blood, in print, is almost unknown. Currency and banking are, at certain seasons, subjects of absorbing interest, and, for the last seventy years, the discussions over them have been numerous and voluminous almost beyond example, and yet we remember no case in which a bullionist called a paper-money man bad names, or in which a friend of free banking accused a restrictionist of defrauding the poor or defacing tombstones. Politics, too, home and foreign, is a fertile source of difference of opinion; and yet gross abuse, on paper, of each other, by political disputants, discussing abstract questions having no present relation to power or pay, are very rare indeed. It seems, at first blush, as if an examination of the well-known *odium theologicum*, or the traditional bitterness which has been apt to characterize controversies about points of doctrine, from the Middle Ages down to a period within our own memory, would throw some light on the matter. But a little consideration will show that there are special causes for the rancor of theologians for which word-criticism has no parallel. The *odium theologicum* was the natural and inevitable result of the general belief that the holding of certain opinions was necessary to salvation, and that the formation of opinions could be wholly regulated by the will. This belief, pushed to its extreme limits and embodied in legislation, led to the burning of heretics in nearly all Christian countries. When B's failure to adopt A's conclusions was by A regarded as a sign of depravity of nature which would lead to B's damnation, nothing was more natural than that when they came into collision in pamphlets or sermons they should have attributed to each other the worst motives. A man who was deliberately getting himself ready for perdition was not a person to whom anybody owed courtesy or consideration, or whose arguments, being probably supplied by Satan, deserved respectful examination. We accordingly find that as the list of "essential" opinions has become shortened, and as doubts as to men's responsibility for their opinions have made their way from the world into the church, theological controversy has lost its acrimony and indeed has almost ceased. No theologian of high standing or character now permits himself to show bad temper in a doctrinal or hermeneutical discussion, and a large and increasing proportion of theologians acknowledge that the road to heaven is so hard for us all that the less quarrelling and jostling there is in it, the better for everybody.

Nor does the *odium scientificum*, of which we have now happily but occasional manifestations, furnish us with any suggestions. Controversy between scientific men begins to be bitter and frequent, as the field of investigation grows wider and the investigation itself grows deeper. But then this is easily accounted for. All scientific men of the first rank are engaged in

original research—that is, in attempts to discover laws and phenomena previously unknown. The workers in all departments are very numerous, and are scattered over various countries, and as one discovery, however slight, is very apt to help in some degree in the making of another, scientific men are constantly exposed to having their claims to originality contested, either as regards priority in point of time or completeness. Consequently, they may be said to stand in delicate relations to each other, and are more than usually sensitive about the recognition of their achievements by their brethren—a state of things which, while it cultivates a very nice sense of honor, leads occasionally to encounters in which free-will seems for the moment to get the better of law. The differences of the scientific world, too, are complicated by the theological bearing of a good deal of scientific discovery and discussion, and many a scientific man finds himself either compelled to defend himself against theologians, or to aid theologians in bringing an erring brother to reason.

The true source of the *odium philologicum* is, we think, to be found in the fact that a man's speech is apt to be, or to be considered, an indication of the manner in which he has been bred, and of the character of the company he keeps. Criticism of his mode of using words, or his pronunciation, or the manner in which he compounds his sentences, almost inevitably takes the character of an attack on his birth, parentage, education, and social position; or, in other words, on everything which he feels most sensitive about or holds most dear. If you say that his pronunciation is bad, or that his language is slangy or ill-chosen, you insinuate that when he lived at home with his papa and mamma he was surrounded by bad models, or, in plain English, that his parents were vulgar or ignorant people; when you say that he writes bad grammar, or is guilty of glaring solecisms, or displays want of etymological knowledge, you insinuate that his education was neglected, or that he has not associated with correct speakers. Usually, too, you do all this in the most provoking way by selecting passages from his writings on which he probably prided himself, and separating them totally from the thought of which he was full when he produced them, and then examining them mechanically, as if they were algebraic signs, which he used without knowing what they meant or where they would bring him out. Nobody stands this process very long with equanimity, because nobody can be subjected to it without being presented to the public somewhat in the light of an ignorant, careless, and pretentious donkey. Nor will it do to cite your examples from deceased authors. You cannot do so without assailing some form of expression which an eager, listening enemy is himself in the habit of using, and is waiting for you to take up, and through which he hopes to bring you to shame. No man, moreover, can perform the process without taking on airs which rouse his victim to madness, because he assumes a position not only of grammatical, but, as we have said, of social superiority. He says plainly enough, no matter how polite or scientific he may try to seem, "I was better born and bred than you, and acquired these correct turns of expression, of which you know nothing, from cultivated relatives"; or, "I live in cultivated circles, and am consequently familiar with the best usage, which you, poor fellow! are not. I am therefore able to decide this matter without argument or citations, and your best course is to take my corrections in silence or with thankfulness." It is easy to understand how all interest in orthography, etymology, syntax, and prosody speedily disappears in a controversy of this sort, and how the disputants begin to burn with mutual dislike, and how each longs to inflict pain and anguish on his opponent, and make him, no matter by what means, an object of popular pity and contempt, and make his parts of speech odious and ridiculous. The influence of all good men ought to be directed either to repressing verbal criticism, or restricting indulgence in it to the family circle or to schools and colleges.

CHAMBORD AT HIS ZENITH.

PARIS, October 23.

I HAVE thought sometimes of making an essay under the title of "History written by Photographs." As I go daily along the line of the boulevards I can measure, as it were, the tide of popular passions. The faces of the members of the Commune have long since disappeared, as well as those of the members of the Government of the 4th of September; I see no longer Favre, or Trochu, or Cluseret. At one time Thiers filled the whole space; the grim little *bourgeois* seemed to smile, behind his spectacles, on every passer-by. He was so long in power that his bust was made in *terra cotta;* a mere photograph was not enough for him; some unknown sculptor represented him wrapped up in a mantle, in a solemn attitude. The bust is gone, the photographs also. Now the time is come for MacMahon; the old white-haired soldier is represented in a thousand ways, and his wife has also a small share in his popularity; she appears often by his side, while Madame Thiers was never allowed to have a place by her husband. The Princes and Princesses of Orleans have been constantly shown to the public during the last two years, but they have had to take their place where they could find it. The Comtesse de Paris was sometimes patronized by the Empress Eugénie in her widow's cap; the Comte de Paris seemed to protect the young Prince Imperial, reading a book by the marble bust of his father. The Duc de Nemours, a living image of Henri IV. as we see him on the Pont Neuf, was gazing on Napoleon III. lying on his death-bed. The Duchesse de Chartres was gracefully making way for the Princess Clothilde, the wife of Prince Napoleon. But now we have changed all that; we have a royal family, and all the princes and princesses stand in a row behind the Comte de Chambord; I ought to say behind the King. The Comte de Chambord is the lion of the photograph windows; we see him not only photographed, but engraved (a very fine engraving, by the way), and all the Parisians look eagerly at the features of the man who proudly tells the French: "I need the support of all; but you all need me." The face is noble and animated, the forehead large; the Bourbon expression is somewhat concealed by a moustache and a beard; the hair is sparse on the top of the head. The only rival of the Comte de Chambord at present is the Duc d'Aumale, since the beginning of the Bazaine trial. It is difficult to imagine how eagerly the French of all classes read the debates at Trianon. I know of one newspaper which sells twenty thousand copies more since the trial began than formerly. The poorest peasants in the country, who don't care for politics, will have the last news from Bazaine. The Duc d'Aumale has presided with much impartiality and dignity; he has produced a most favorable impression on men of all parti by his patriotic attitude, and some of the expressions which he has used hav become rapidly popular. Of course, he became at once the prey of the photographer; he is seen everywhere with Bazaine. Sometimes the marshal is represented with his wife standing by him and his two young children, one of these on a rocking-horse. This appeal to the sensibilities of the public was found necessary after the interrogations which took place at the court-martial. Madame Bazaine and the boy on the rocking-horse are perhaps the best advocates of the marshal, and will do more for him than M. Lachaud, his lawyer, who said to a friend some time ago, "Why! this Bazaine trial is the biggest trial we have had since *l'affaire* Louis XVI." He said "l'affaire Louis XVI.," just as poor Gaboriau, who died lately, entitled one of his sensational novels "L'Affaire Lerouge."

But let us return to the Comte de Chambord. He is now the undisputed king of the shop-windows—we have the Chambord paper, marked with the *fleur-de-lys;* the Chambord perfume, etc. These indications are the material symptoms of an eager desire on the part of the Parisians. Three months ago, the shopkeepers knew very little of the Comte de Chambord. They pronounced him "impossible"; but now he has become, so to speak, the head of the Orleans family, he has renounced the white flag, and taken the position of a constitutional sovereign. He has therefore become "possible," and from possible to necessary there is but a short distance. My Republican friends make reconnoissances in the faubourgs, to Belleville, to Valette, and Montmartre; but those who have returned from the hulks—those who escaped from the jaws of death in the terrible days of the Commune—care little for the Republicans who were at Versailles during the struggle. They don't vote for Rémusat; they vote for Barodet. If there is to be a king, they like the Comte de Chambord quite as much as any other. They will not move a finger for our conservative Republic, for Thiers, even for Gambetta. They want work and good wages; they turn round with contempt on those who did not fight with them, with guns in their hands; upon the *avocats,* who can only fight with their tongues. The faubourgs of Paris are as safe to-day for the Comte de Chambord as the gardens of Frohsdorf. Paris is very much in the state in which Henry IV. found it after the dreadful days of the League. The Béarnais found that his capital was well worth a mass; the Comte de Chambord sees that it is worth a tricolor flag. The Commune committed hardly as many horrors as the famous Committee of the *Seize;* the Spaniards kept Paris in fermentation; the Germans saw, from St. Denis, the shells falling on Paris, and witnessed the conflagration of its palaces. They now make pious wishes for the success of the Republic in France. The loyal subjects of Emperor William, who writes to the Pope that his power comes from God, are not willing to see France gathering strength under a hereditary monarchy.

I opened once, after the Commune, the *Satire Ménippée,* and fell upon these lines of the admirable speech of M. d'Aubray, who spoke for the third estate:

"O Paris, which is no longer Paris, but a pit of ferocious beasts, a citadel of Spaniards, of Walloons and Neapolitans; an asylum and a retreat of murderous thieves! will you not remember your dignity, and remember what you have been, seeing what you are; will you never get cured of this frenzy which, for one legitimate and gracious king, has engendered for you fifty kings and fifty tyrants? You are in irons: you are in the hands of the Spanish Inquisition, more intolerable a thousand times, and harder to bear for French-born spirits, than the most cruel deaths. . . ."

A few pages further, after having explained the necessity of establishing a national government, and attacked the candidate of Spain, d'Aubray says:

"We want a king—a natural chief, not artificial—a king already made, and not to be made: and we will not take the advice of the Spaniards, our inveterate enemies, who wish to be our trustees by force, and to teach us to believe in God and in the Christian faith. We will not have for councillors or doctors those of Lorraine, who so long have been waiting for our death. The king whom we ask for has been made by nature; he is born in the garden of the lilies of France, a straight and green stalk of the stem of St. Louis. Those who speak of making another are deceived and cannot do it; they can make sceptres and crowns, but no king to bear them; they can build a house, but not a tree, nor a green branch. Nature but produced it in space of time from the juice of the earth. We can make marshals by the dozen, and peers, and admirals, and secretaries, and councillors of state, but not a king."

How strange that the force of historical tradition, so well described here by the *Satire Ménippée*, should be as well felt even now, after 1789, after 1793, after the First Empire, after 1830, after the Second Empire, after the 4th of September! The feelings which are expressed in the quaint language of the *Satire Ménippée* have been kept like those springs which run under low strata and suddenly come to light again. The highest barrier between the Comte de Chambord and the country was the white flag; this barrier is now down, and king and people look at each other with a sort of astonishment, with mixed feelings of pride and shame, of regret and of hope. He would be imprudent who should predict with certainty that the monarchy will be re-established. The two armies are nearly equal in numbers in the Chamber; each party counts the votes which it hopes to secure, and each claims the victory. But on one side we see all the Monarchists united on the same ground, capable of carrying on a government on some fixed constitutional principles; on the other, we have the Conservative Republicans, the Red Republicans, the Communists, and the Bonapartists united only for an hour.

France must choose between a monarchy and a red republic; and in France the red republic is the republic of Gambetta, of Barodet, of Rane. The marriage of France with the monarchy, if it takes place, will not be a marriage of inclination; it will be a marriage of reason. There is too much blood between the Comte de Chambord and the country; and we are as slow to pardon the wrong we have inflicted ourselves as the wrong which has been inflicted on us. The marriage of France with the Republic will be a marriage of fear. The revolution will take the bride to the altar pale and trembling and downcast. The marriage of inclination would have been the marriage of the sons of Louis Philippe with the Orleanists. Yet who but M. Thiers tried to keep the princes in exile? Who disorganized, even before the fall of the empire, the old Orleanist party? Who tempted the Rémusats, the Dufaures, the Casimir-Périers, and told them that they would find it easier to be his ministers than the ministers of a new king? Who threw the Comte de Paris, abandoned and betrayed by all those whom he had considered as the friends of his father, of his mother, into the arms of his cousin, the Comte de Chambord? If even at this late hour, after M. Thiers has succeeded in forming out of the old Orleanist party the party of the Conservative Republic, the monarchists of the Chamber can balance the republican force, who will say that the monarchists were not in a majority on the day when the Chamber met at Bordeaux? This majority obeyed the will of M. Thiers, and it was only on the 24th of May that it rejected him, when it saw that the Republic was only becoming the screen of the Commune. Now all is undecided; the destinies of the country are in suspense, and nobody can say with any certainty what is to be the future of France.

Correspondence.

THE PEACE POLICY.

To the Editor of the Nation:

Respected Friend: A question so grave as the right management of the uncivilized Indians of the Southwest should be treated dispassionately. Complicated as it is by all the untoward events which have occurred since General Coronado first met the Indians of the Plains three hundred years ago, and murdered his captives, it specially demands fairness and accuracy. The former requisite can scarcely be said to have been fulfilled in a letter in the last number of the *Nation* by calling the peace policy of the Government, as carried out through the Friends, "a bloody nuisance." The latter, probably unwittingly, has been violated by the assertion that the promise of the release of Satanta and Big Tree was made without authority, by a Quaker agent. These chiefs belong to the Kiowas, not to the Comanches, and the two tribes, though associated, neither intermarry nor have the same tribal organization. Satanta and Big Tree undoubtedly committed great crimes, for which they were arrested at the request of Agent Tatum, a Friend, to whom they had admitted their guilt. It was no sympathy for them, but the belief that their return to their tribe, after being humbled by imprisonment, and upon the fulfilment of certain conditions by it, would prevent raids into Texas, which induced Superintendent Hoag and others most informed to ask their release. This was promised to the Kiowas, after careful explanation of the terms, by the agent and others, but only by authority from Washington, as official records will show.

The Kiowas fulfilled the conditions at first demanded. They returned all captives to the agent, and also the stolen stock, it is believed, as fully as the chiefs were able to identify it. The chiefs, moreover, organized their people into companies, and thus prevented their bad young men from raiding—in some instances surrounding the camps of those suspected of criminal designs. The Comanches did commit some depredations, and were punished by a military force attacking the camp of one of their parties while off their reservation, killing several men and taking captive a number of women and children. But the Kiowas, having fulfilled the conditions at first imposed, were surprised at new and difficult terms being proposed at the Fort Sill council by Governor Davis; and it was confidence in the Quaker officials which induced them to continue the negotiations.

It scarcely admits of a doubt that it was the influence of the Friends, seconding the efforts of Commissioner Smith, which averted the Indian war hinted at by the correspondent of the *Nation*—a war in which other tribes of the Plains would almost certainly have been involved, and of which the results to whites and Indians would have been terrible indeed. There were thirteen murders by Indians in Texas in 1871, eight in 1872, and five in 1873, the last by Comanches only. It is sad, indeed, that there should be any; but this diminution gives hope for better results in the future. In one county of Kansas, bordering upon the Indian Territory, we are informed, upon what seems reliable evidence, that thirty-one murders were committed by citizens upon each other during the past year, and that not one of the murderers was brought to punishment. It appears, then, that the combined influence of the United States Government and that of the chiefs of the Kiowas and Comanches has done vastly more to prevent crime among them than the government of one of our sovereign States among its own white citizens.

It is impossible that the habits and passions of an uncivilized race, smarting under loss of territory—the wanton destruction of the buffalo, their main support—and the violence and treachery of bad white men reaching through generations to near the present time, should be changed quickly. Much has been accomplished in three years. Confidence in the good faith of the Government, and of *some* white men, has been restored. All the chiefs, it is believed, now desire to maintain their promises to the Government to the extent of their power. They say truly, "We suffer from Texan horse-thieves. Washington cannot control all his bad men, neither can we all of ours." Some of the chiefs have begun raising cattle. One small band tills the soil. A school is open for their children. Another will soon be opened, for which pupils are promised. One missionary follows the camp of "Kicking Bird" from place to place, and has obtained a strong influence over his band. Two others offer to enter upon the same life of hardship and self-sacrifice, and will probably soon be in the field. To-day the Friends most closely interested and engaged in the management of these Indians have more hope of their ultimate Christian civilization than ever before. The present policy of the United States Government, so far as it is one of peace and justice, and places men with Christian motives in close relation to the Indians, is more in accordance with the laws of God and of human nature than any hitherto pursued. It is just so far certain of final success, if sustained by the patience, sound sense, and Christianity of the nation.—Respectfully,

James E. Rhoads.

Philadelphia, Nov. 2.

A LETTER FROM MR. GRANT WHITE.

To the Editor of the Nation:

Sir: A resolution to submit in becoming silence to the wholesome strictures of the *Nation* is hardly broken by a request to be allowed to say a final word in reply to a letter from one of its correspondents (Dr. Hall), whom you have permitted to refer to an article and to answer a letter, neither of which were published in your columns. Dr. Hall announces his intention of doing something dreadful about my philological pretensions, and of refuting, at his leisure, the censures to which he has exposed himself. As to which I would say that, be my philological ability and acquirement less or more, I have never made any philological "pretensions"—so far from it, that finding my articles in the *Galaxy* described in the proof of a publisher's circular as "philological," I struck the word out, and requested the whole character of the announcement to be changed.

Because I quoted old Ennius about barking *sine dentibus*, he insists upon exposing in bare English all of that which I left under the veil of what he urbanely calls my "cheap Latin"; but I think that our readers, like Morose in Epicœne, would say to him, "I understood you before: good sir, avoid your impertinency of translation."

If he had done no more than to endeavor to counteract what were in his judgment the "erroneous teachings" in any book or article of mine, I should have learned from him in silence, or have disputed his positions with respect. Criticism we must all submit to; and even unjust censure it is generally prudent to leave unnoticed. Misrepresentation and derogatory personal reflection stand quite in another category. Also, I desire to say now, beforehand, that as this "unpleasantness" between the author of 'Recent Exemplifications' and myself was neither of my seeking nor of my beginning, if it has not been ended by me, it, at least, shall not be by me continued. There are some disputes in which no man of ordinary prudence will care to have the last word, even if he did not have the first. With my review of 'Recent Exemplifications' published, and to be published, this controversy, as far as I am concerned, is closed.

Your obedient servant, R. G. W.

New York, November 7, 1873.

Notes.

ROBERT CLARKE & CO., Cincinnati, have in press 'Essays on Educational Reformers,' by Robert Herbert Quick, M.A., Trinity College. ——Mr. C. C. Fulton's recent letters from abroad to his paper, the Baltimore *American*, are to be collected in book-form under the title, 'Europe Viewed through American Spectacles,' and published by J. B. Lippincott & Co. The same house announces also 'The Border-land of Science,' by Richard A. Proctor; a 'Dictionary of Sects, Heresies, and Schools of Thought,' by various writers, edited by Rev. John Henry Blunt, already editor of the useful 'Dictionary of Doctrinal and Historical Theology'; a 'History of French Literature,' adapted from the French of Demogeot by Christina Bridge; and a new edition of the long-since scarce work of the late Dr. Lieber on 'Civil Liberty and Self-Government,' revised by President Woolsey.——Prof. Bonghi, one of the Italian jurors for public instruction at the Vienna Exposition just closed, has procured permission of the ministers of agriculture and commerce and of public instruction to found at Rome a permanent museum (*museo scolastico*) for the reception of all the instruments of education (*oggetti attinenti all' istruzione*) which may be obtainable of foreign governments, either by exchange or by purchase at a moderate cost. He appears to have undertaken a journey to Vienna with a view to taking advantage of the collections already there.——It is announced in No. 42 of Paul Lindau's *Gegenwart* (Berlin) that hereafter the attempt will be made to add to the present attractions of that very readable paper a brief *résumé* of the most important articles in the periodical press of Europe and the United States; a service like that performed by the *Academy*.——The German Congo Expedition on the coast of Africa has fallen in with a German-American making sketches for *Harper's Weekly*—fresh evidence to the Berlin Geographical Society of the enterprise of the American press. He has acted as artist for the Expedition in their common field of operations.——G. W. Carleton & Co. have in press Robert Dale Owen's autobiography, 'Threading My Way,' a work which offers singular points of contrast to Mr. Mill's autobiography; and they will also publish a brief life of the late Mrs. Parton ("Fanny Fern"), forming, with selections from her best writings, a memorial volume, illustrated by Arthur Lumley.——We have received from B. Westermann & Co. Parts 15 and 16 of Stieler's 'Hand-Atlas.' As already noted, the former contains an oro-hydrographical map of Germany and the adjacent countries, and maps of Russia and Scandinavia. Part 16 gives the first of a series of four plates of France, and the whole of South America in two plates, with enlarged-scale plans of Paris and Rio, and the Bay of Rio.

—On Friday, the 14th instant, Mr. William Page, at the request of Mr. Bryant, Judge Daly, Mr. W. T. Blodgett, Mr. Taylor Johnston, and numerous others of our best-known citizens, will deliver a lecture on what he believes the best and most satisfactory of all the portraits of Shakspeare, and quite authentic. And his descriptions and arguments Mr. Page will illustrate by means of two copies in plaster of a colossal mask upon which he has long been at work, and which is now completed. To many of our readers the story of this beautiful portrait, if portrait it be, is already known. To others it is not, and to these we may briefly indicate its main points. In 1847, a German gentleman, Ludwig Becker, resident we believe in or near Cologne, came into possession of a small painting done in oil, upon parchment, and bearing the date of 1637, which purported to be a picture of the great English poet, Shakspeare, lying on his death-bed. It had long been in the picture-gallery of a noble family, Von Kesselstadt by name, one of whom had, in 1616, the year of Shakspeare's death, been attached to a German embassy in England. In 1847, the Von Kesselstadt gallery was for some reason broken up, and Mr. Becker acquired the little painting in question. He at once perceived, and so stated to some of his brother antiquarians, that his painting might very probably have been copied from a mask. Enquiry on the spot informed him that persons familiar with the gallery from which the picture came had always seen hanging near it a mask in plaster which professed to be a portrait of Shakspeare, brought from England by the Von Kesselstadt of the embassy above-mentioned. Examining the picture, its new possessor came to the conclusion that it had been ignorantly named "The Deathbed of Shakspeare," and that it clearly was a representation of the poet, laurel-crowned, lying in state after death. The date, 1637, he accounted for by supposing that the returned ambassador or ambassador's attendant, twenty years after procuring a mask of the face of the poet, just dead, had commissioned a clever painter to reproduce for him the scene which he himself, in April, 1616, had witnessed in Stratford Church, and that the painter in doing so had the use of the mask. To find this mask, which local rumor asserted to have but recently been hanging beside the picture, Mr. Becker searched for some time, and was rewarded by discovering it lying disregarded in a small shop, whence he easily rescued it. Photographs of various views of this ill-used and now somewhat battered work Mr. Page procured about four years ago, and being a most enthusiastic student and admirer and personal lover of Shakspeare, whom we may say truly he "knows by heart," he has devoted many months to an attempt to produce the true counterfeit presentment of our great poet. The colossal mask with its solemn beauty is the result, and Mr. Page's business at the lecture which he is invited to give will be to show how, in every detail, his favorite portrait sustains and is sustained by other portrait pictures and the portrait bust at Stratford, and is to be regarded as a veritable portrait, and not only that but also as artistically the best. We are very glad that the subject is to be brought to the attention of the general public.

—As of most of the recent documents of the Bureau of Education, we have to say of Circular of Information No. 4 that the idea is good, but the execution imperfect. This one, however, is confessedly only tentative, and designed to obtain "information" for the Bureau as much as to impart it to the public. The Bureau, it seems, is bent on getting in readiness for the Centennial "a complete and exhaustive catalogue of all the published works, large and small, of the college professors and instructors" of the United States that have appeared during the five years 1868–72—at least we infer this limitation, though the circular is not explicit. The catalogue now given embraces only this period. First we have an alphabetical list of authors; then, classified lists of their works. But the former is unaccompanied by any index, so that one cannot, except by searching every department, ascertain how many works of any given author have been recorded. This imposes a very unnecessary labor on those who are disposed to furnish the corrections and additions requested. The authors themselves have in most cases been applied to, while the Bureau has for its own part searched a number of volumes of proceedings of learned societies, reviews, etc., etc., with here and there a gap in the series which one would think might have been filled with a little waiting. School-books do not appear under "Education" nor by themselves, but are classified by subject-matter, and we do not find Searing's Æneid, Chase's Horace, Gray's School and Field-Book of Botany (even *under* "Gray"), Loomis's Elements of Astronomy (even *under* "Loomis"), Johnson's Analytic Geometry (1869); Waddell's Greek Grammar (1869), nor Latin (1871); Comfort's German Course (1870), nor German Reader (1872), Harkness's Cæsar, Spencer's Greek for Beginners, Whitney's German Reader (even *under* "Whitney") (1870); nor Swinton's U. S. School-history, and Word-Analysis (1871). Omissions where the author is mentioned (like the three just noted) also occur under Schele De Vere—Great Empress (1869), and Romance of American History (1872); A. S. Packard, jr.—Guide to the Study of Insects (1869–70); H. B. Hackett—editing of Dr. Smith's Bible Dictionary (1870); and J. S. Newberry—Geological Survey of Ohio (1872). The following named authors (professors) are entirely omitted: G. F. Barker—Correlation of Vital and Physical Forces (1870), Elementary Chemistry (1871); A. S. Bickmore—Travels in the Indian Archipelago (1869); Hiram Corson—Anglo-Saxon and Early English (1871); E. P. Evans—Abriss der deutschen Literaturgeschichte (1869); G. P. Fisher—Supernatural Origin of Christianity, and Council of Constance (1870); Austin Flint, jr.—Physiology of Man (1869), Physical Effects of Muscular Exercise (1871); G. W. Greene—Life of Gen. Nath. Greene, and 3d ed. of Historical View of Am. Revolution (1871); W. A. Hammond—Physiology and Pathology of the Cerebellum (1869), Diseases of the Nervous System (1871); Joel Parker—First Charter and Early Religious Legislation of

Massachusetts, and The Three Powers of Government (1869); Theophilus Parsons—Shipping and Admiralty (1869); J. N. Pomeroy—Education in Politics (1869); R. Pumpelly—Across America and Asia (1869); M. C. Tyler—Brownville Papers (1869). All which we offer, errors excepted, as our contribution towards the more perfect list.

—The list of names in the International Juristical Conference, held at Brussels October 10, shows that the attendance, though not numerous, was of a character to give weight to its conclusions, and was fairly representative of the leading nations of Christendom. The Conference was organized by the choice of the following officers: Mr. D. D. Field, Hon. President; M. A. Visschers, President; Messrs. Bluntschli, Mountague Bernard, Giraud, and Mancini, Vice-Presidents; and Messrs. De Laveleye, Jencken, and Miles, Secretaries. When the Conference resolved itself into a permanent Association, these gentlemen were constituted the Bureau for the ensuing year, to report to a meeting at Geneva in August next. The deputies of each country were empowered to add to the membership of the Association from their several nations, subject to the approval of the Bureau. The style of the body is the Association for the Promotion of International Law. At first there were some signs of friction between this body and the "Institut de droit international," lately constituted at Ghent; but as many gentlemen of the Conference were members of both bodies, the apparent rivalry was obviated by an agreement to the effect that the Institute should devote itself to purely scientific treatises, while the Association should solicit such treatises from the Institute and other sources as the basis of its appeals to governments, to parliaments, and to public opinion. The Association was unanimous in the result that the codification of international law, defining with as much precision as possible the rights and duties of nations and of their members, is desirable for the peace, the harmony, and the convenience of nations; and in this view, a committee was appointed to prepare a *projet* of the different parts of such a code, to be submitted to a future meeting. It was subsequently recommended that this committee should commence its work with the private rights affected by international treaties and conventions. The interest of the Conference centred in the question of arbitration, the discussion of which occupied nearly two days. At one time, it seemed likely that the body would dissolve without reaching any conclusion; but, by patience and good-will, a result harmonizing the views represented by Messrs. Bernard, Bluntschli, Mancini, Passy, and Richard was reached, and a resolution passed declaring arbitration "just and reasonable," and even "*obligatory* on all nations," and that though this mode of solution is not always applicable, it is applicable in most cases; and that no difference ought to be considered insoluble until all pacific modes of adjustment have been exhausted. What was meant by "obligatory" here did not clearly appear, and yet it was the most important term in the resolution. Mr. Mountague Bernard writes to the London *Times*, apparently wishing to guard himself against responsibility for the proceedings, declaring that he did not consider the codification of international law possible, and that the resolutions passed were not of "great practical importance," but that he thinks that great good must come, and in this we cordially agree with him, from the discussion of this class of questions by English and American and Continental lawyers, as their mode of approaching judicial subjects differs to a degree which causes real inconvenience when an attempt is made at arbitration.

—The feudal right of disembowelling serfs has, we believe, at last been traced to its source. Rougebief, cited by a correspondent as an authority (*Nation*, No. 428), evidently obtained his knowledge of the lawsuit which was said to have brought out the facts, either from A. Barginet ('Histoire du gouvernement féodal,' Paris, 1825), or directly from the 'Cri de la raison' of the curate Clerget, relied upon by Barginet and by Dulaure in his 'Historical Sketches of the Principal Events of the French Revolution.' According to these narrators the suit was brought in the *parlement* of Besançon (no date), before a magistrate (anonymous), and the Count de —— produced an act in which the inhabitants of —— agreed to assume certain charges for sixty years on condition that meantime the seigneur should renounce his right to make them accompany him on the hunt, and in winter to disembowel them in order to warm his feet in their entrails. On the famous night of the 4th of August, 1789, Lapoule, a deputy of the third estate for the bailiwick of Besançon, made in the Assembly a speech so extravagant that it was interrupted, and was not inserted in the *Moniteur*. Villiaumé, in his 'History of the Revolution,' states that the interruption was caused by a cry of indignation, due to the mention of the seigneurial right in question. We suppose it is doubtful (other historians being silent) whether this was really the subject of Lapoule's remarks, and whether Clerget is not the only authority for the story, which has been caught up and repeated by a host of modern historians, including Cesare Cantù in his 'Universal History.' At all events, the evidence proves to be fatally defective. In the September *Polybiblion*, from which we derive these facts and references, a contributor, writing on the same subject, states that in the Gallic laws collected by Hoël, at the beginning of the 10th century, there figures among the officers attached to the person of the prince or *brenin* of the canton a *Troydyane* (*pedifer*), whose functions were to hold in his lap the feet of the brenin from the time of his sitting down at table till bed-time (or nap-time), to rub his legs, and keep him from harm. He was a free man, eating out of the same plate with the brenin, and holding a fief. It is suggested that this custom may have been imitated by less powerful seigneurs, on their return from the chase, and that the vague reminiscence of it has given rise to the barbarous tradition first recorded by the curate Clerget.

LESSONS OF THE FRENCH REVOLUTION.*

II.

LORD ORMATHWAITE thus writes of the Revolutionary leaders: "They succeeded more completely than any revolutionists had ever done in uprooting every principle, every institution, every belief, every tradition, political, moral, and religious, which had ever been received by nations or exercised influence over mankind." This statement will be accepted without criticism by men who disagree in their whole view of the Revolution, by writers who admire Robespierre no less than by authors who, like his lordship, adore the Bonapartes. It contains exactly the amount of truth sufficient to make it pass current; for it is undoubtedly true that the Revolutionists, or rather some of them (for it is childish to lump up together in one class, after the manner of Lord Ormathwaite, men so different as Mirabeau, Lafayette, and Robespierre), did attempt to change the institutions and sentiments of mankind, and believed themselves to have succeeded in their endeavor. The new calendar, the worship of reason, and all the fantastic performances of Revolutionary legislation, would become as unmeaning as they were childish, did we not know that to the minds of their authors they appeared to be the appropriate outward signs of the foundation of a new state of society, resting on new principles and sentiments. Yet the assertion we have quoted is at bottom one of those delusive platitudes which, accepted alike by Tories and Jacobins, contain more falsehood than truth, obscure the nature of the Revolution, and hide the causes of its failure. As a matter of fact, the Revolution did not uproot the beliefs, traditions, or principles which had long prevailed in France. Many institutions were destroyed; many more were in fact left standing, but were called by new names. A critic who surveys the result of the movement as regards France will be more struck, the more deeply he examines, with its curious superficiality. In one instance after another the spirit of the *ancien régime* has survived where its forms have been altered. It was the policy of the monarchy, for example, to promote centralization and to weaken the nobility. No one now doubts that the Revolution gave still greater force to exactly the same tendencies. Look, again, at the startling difference of sentiment which seems to set an almost impassable division between the towns of France, which are, roughly speaking, republican, and the country districts, which are conservative, if not monarchical, in sentiment. The distinction is one which certainly dates back to a time prior to 1789, and its existence proves that the Revolutionists did not succeed in imbuing the country with liberal principles.

Look, again, at the influence of the Catholic priesthood. The Revolutionary leaders differed greatly in their political views, but they all agreed in their desire to spread enlightenment, and in their belief that the Revolution had struck a fatal blow at the rule of superstition. In fact, it is in the domain of religion that their failure has been most conspicuous. The Roman Catholic Church exerts at this moment greater influence in France than it has exerted at any time during the last century. It has, in fact, revived in such power that it possibly may be able to restore for a time at least the rule of the Bourbons. We do not for a moment wish to exaggerate the extent and permanent power of the present clerical and conservative reaction. The general revolutionary movement of which France once took the lead has not, as we before pointed out, been defeated either by nobles or by priests. Any calm observer who surveys the whole condition of Europe will see that her hierarchical power has lost far more than it has gained in the long conflict between it and liberalism which has now gone on with varying success for more than a century. What we do maintain is that in France itself the Revolutionists did not root up the religious tradition of the country. Two facts are in this point of view most instructive. Divorce is still unknown to the law of France, and has never been legalized except for a limited period during the first Revolution, and, unless we are mistaken, during the First Empire. The marriage of a Roman Catholic priest is still in all probability illegal. The Code preserves on this point an ambiguous silence. No one dares confi-

* 'Lessons of the French Revolution—1789-1872. By Lord H. Ormathwaite.' London: Richard Bentley & Son.

dently assert such a marriage to be valid, and the best French lawyers are apparently of opinion that the rule of the Church of Rome is still in this respect the law of France. In spite of outward revolutions, the spirit of the French people is still controlled by Roman Catholic sentiment and tradition. If any one objects that the French leaders, if they did not totally break with the past, yet achieved as fundamental a revolution as ever can be carried out by the efforts of one generation, he should in fairness compare what we have termed the superficiality of the Revolution with the thoroughgoing effectiveness of the Reformation. In no country did the Reformers apparently effect such slight alterations as in England. The movement of the sixteenth century left the Church of England so little changed as regards names, forms, and even doctrines, that antiquarian pedantry has of recent years maintained the paradox, that the Church of England was never in effect reformed at all, and remained after as before the Reformation the same body in its essential features which it was in the time of Thomas of Canterbury. This paradox can, however, never deceive any student who looks rather to things than to names. The Church is at bottom a Protestant body. The breach with Rome and the marriage of the clergy effected an essential change which no antiquarian of ecclesiastical subtlety can explain away. The Reformers went to the root of the matter. They changed the spirit of the nation, and could afford to neglect forms when they had secured the substance. The French Revolutionists again and again have sacrificed the substance in their anxiety about words and formulas. Whatever be the cause, they have not uprooted some of the most important of the traditions, principles, and beliefs which were handed down to them by the *ancien régime*.

The recognition of the Revolutionary failure does not of itself explain the cause of this failure. The question still remains, why did the efforts of the Revolutionists effect so little for the freedom of France? Lord Ormathwaite and the authorities he follows attribute the errors and failure of the Revolution to the false political and social principles impressed on the Revolutionists by the philosophers of the eighteenth century. This explanation contains, no doubt, an element of truth, but cannot, we should think, give satisfaction to any unprejudiced reader. The theories of Voltaire and Rousseau are, in the first place, by no means absolutely false. In many respects they have modified, and beneficially modified, the whole condition of the civilized world. Moreover, no statesmen whom the world has seen have ever held absolutely true speculative beliefs. Yet, in fact, unsound theory has not always led to mistaken practice. The founders of the American Union, for example, held most of the political dogmas which were entertained by their French imitators, yet they founded a constitution which, though not free from defects, has lasted for nearly a century, and has been found adapted to the wants of the country, whilst no French statesman has been able to erect a constitution which should last as long as twenty-five years. Passages, again, might be quoted from Blackstone which come very near the doctrine of an original contract, and certainly countenance that notion of natural rights, or even of popular sovereignty, to which English writers are fond of tracing the errors of the Revolution. Add to this, that the speculative views of writers like Lord Ormathwaite are themselves by no means above criticism. His favorite theory of the balance in the constitution of monarchical, aristocratic, and democratic elements, would find no more favor in the eyes of a critic such as Bentham than would the pretentious dogmas embodied in the declaration of the rights of man. If erroneous speculative beliefs were in themselves inconsistent with sound statesmanship, it is difficult to see why England and America should not have fallen into calamities as great as those which have marked the course of French politics.

The truth appears to be, that the failure of the French Revolutionists to secure the freedom of France—a failure which the most judicious French writers, such as De Tocqueville and Quinet, frankly admit—is due to causes which both English conservatives, who see in the Revolution nothing but evil, and French republicans, who would fain see in it nothing but good, equally overlook. The task which in 1789 the French people were called upon to perform was one which the circumstances of the case made all but impossible of performance. The men into whose hands the guidance of the country fell were unequal to their work, and the country itself was perhaps of all the countries in Europe the one least capable of carrying out with success the changes which the times required.

The task was all but impossible of performance. The work before the States-General in 1789 was not the foundation of the republic, but the modification of the monarchy so as to make it compatible with the sovereignty of the nation. Englishmen talk as if this were an easy matter. "The original constitution of the States-General properly worked," writes Lord Ormathwaite, "or the adoption of our own system of two independent chambers, would gradually have swept away abuses, and assimilated her condition to ours. France had all the materials previous to the meeting of the States-General for entering on a course, if not precisely identical, yet not dissimilar from our own." So says Lord Ormathwaite, and so Burke and others have said in effect before him, but no allegation can be more unfounded. France never had possessed before 1789 any real constitution; France did not possess that powerful aristocracy which has at bottom been, under monarchical forms, the support of the aristocratic constitution of England. Moreover, England herself did not establish the sovereignty of the nation, which is the essential feature of popular government, until after nearly a century of revolution. It is very characteristic of Burke and of the school of writers who, with none of his genius, repeat the most doubtful part of his doctrines, to dwell exclusively on the English Revolution, and to forget the great rebellion which, after all, made the Revolution possible. Moreover, English history, if it is to be appealed to at all, teaches that you cannot establish a constitutional government under a monarch who has been used to absolute power. Modern experience repeats the same lesson. For the success of a revolution, it is necessary that the government that it founds should sympathize with it. You may effect this by a change of dynasty, you also may effect it, as in modern Italy, by making the power of the dynasty depend on the maintenance of the new constitution. But it still remains to be proved that you can found a popular government, and yet leave at its head the man whose powers have been taken by the people. No one can believe that American independence could have been secured had the founders of the Republic felt themselves bound to leave George III. nominally at its head. Yet the difficulty of an American commonwealth with the English king for president was not as great as that of forming a constitution for France of which Louis XVI. should be the nominal head. We have in our own days seen a similar difficulty lead to a less bloody but not more decisive catastrophe. In 1846, both Italy and the Pope believed that Pius IX. might guide the country to freedom and independence. The Italian Revolution of 1848 was mainly rendered abortive by the delusion that the modern Papacy was reconcilable with modern ideas of liberty and national unity.

The men of the Revolution were unequal to their task. They have passed as giants because of the greatness of the crisis with which they dealt. It would be unjust to call them dwarfs, but they certainly were for the most part persons both morally and intellectually of average stature. On this point it is necessary carefully to eschew the mass of legend with which the zeal of followers as well as the hatred of opponents has surrounded the Revolutionary heroes. Statesmen must be judged of by their foresight, and by their judicious use of means. According to either criterion, the greater number of the men of the Revolution must be pronounced politicians of not more than ordinary ability. Their want of foresight is conspicuous. Even the men who were ultimately the most ardent republicans hardly foresaw the approach of the republic. Not one of them seems to have perceived the great inconvenience incurred by bringing back the king from Varennes, or even to have suspected that could Louis have been suffered to cross the frontier he might have saved not only himself but the country from ruin. Even the most remarkable of their body do not seem either to have realized the difficulty of dealing with the Catholic priesthood, or to have imagined a consistent policy by which to regulate the relations of the state and the church. They could neither conceive of disestablishment combined with absolute and impartial toleration, nor of the substitution of one form of national religion for another. The policy they actually adopted was one which ensured all the evils without giving any of the advantages of persecution. For their use of means was on the whole as injudicious as their views were short-sighted. Spectators who saw the horrors of the Reign of Terror were mainly struck with the reckless inhumanity of the Revolutionists.* Later critics wonder rather at their political incapacity. When the Shah of Persia heard that M. Thiers was driven from power, he is said to have asked, "Why have they not cut off his head?" The story, true or not, exactly represents a barbarian's idea of the right way of dealing with a political opponent. The notion of the Shah was exactly that of the Revolutionists. Neither they nor he could understand all the evil results to their own cause produced by reckless violence against political enemies. Neither they nor he could enter into the spirit of the words which Cavour is reported, truly or not, to have muttered on his death-bed, "I will have no state of siege; any one can govern with a state of siege." The mode of government which Cavour rejected was exactly that which in spirit the heroes of the Revolution adopted, and which has been the favorite recourse of every French government since their time. It has been well observed that the cruelty of the Terrorists can be at least accounted for by the inhumanity of the old French criminal law. The remark is both true in itself and admits of very wide application. The policy of the Revolutionary government might fairly be explained as the application on behalf of the Revolution of the method of government which had been invented by the monarchy. The French Revolutionists, in other words, inherited the arbitrary character of the government they had overthrown. When the Jacobins chose to consider the mob of Paris as armed with the

authority of the country, they practically carried out exactly the same idea which made Louis XIV. identify himself with the state. They could not root up the sentiments and traditions of the monarchy, because they themselves, and to a great extent the country also, were imbued with these sentiments and traditions.

For, despite of the mixed pity and admiration which the history of modern France must excite in those who study it, it must be candidly admitted that the defects of the French themselves were almost incompatible with the success of the Revolutionary experiment. It is possible for us to see many things which were inevitably concealed from the generation who witnessed the meeting of the National Assembly. It is, for example, perfectly clear that the state of the French peasantry and of the country districts made it almost impossible to carry out at once a thoroughgoing reform. It is equally clear that the Roman Catholic Church could not adopt the principles of modern liberalism even in their most moderate form, and that the Catholic Church exerted an amount of permanent influence in France beyond that for which either friends or foes gave it credit. It is again certain that a despotic government of centuries had by degrees rendered the mass of the people almost incapable of performing their part under the rule of freedom. For the people themselves, it must in fairness be said that they were at the commencement of the Revolution ready enough to trust educated guides, and it should carefully be noted that even to the very end of the movement of 1789, the leading Revolutionists were men who in position and education stood far above the populace; and if either the king could have made himself the leader of the Revolution, or any one statesman could have come to the head and made himself, as it were, the representative of the people, the French nation might have been guided to liberty by a king or a minister, as the Italians have let themselves be guided to independence under the guidance at one time of Mazzini, at another of Cavour. That this was not their good fortune arises partly from circumstances which can only be summed up under the very vague designation of chance. But it arises also from what no good-will towards France can conceal from any honest observer. For the last eighty years France has again and again suffered from the incapacity of the majority of moderate and sensible men to impose their will on violent partisans. The nation has constantly been made the sport of a faction. It is perplexing to see what is the source of this incapacity in a nation as rich in talent as any country in the world. To explain it entirely one would need to trace the whole course of French history. Two partial explanations deserve consideration. The first consists in the effect produced by years of revolution. The mass of every nation is, it may be suspected, cowardly and apathetic. It soon learns, after one or two revolutions, to stand by and let violent men fight out their contest for power without its interposition. In 1745, the mass of Englishmen stood quietly by whilst a body of five or six thousand Highlanders marched from Scotland to the middle of England to overthrow the government, and then marched quietly back unmolested. The second is to be found in the history of French Protestantism. All the qualities which we miss in modern Frenchmen were found in the French Huguenots. The destruction of Protestantism was in some sense the destruction of the nation. The Massacre of St. Bartholomew and the Edict of Nantes explain both the outbreak and the failure of the Revolution.

CLARKE'S SEX IN EDUCATION.*

IT is an unquestionable fact that the health of American women has on the average distinctly deteriorated during the past forty years. The delicate beauty of American girls quickly fades; the diseases peculiar to women are commoner than they used to be, and women of the educated classes are less able than formerly to bear and nurse children. The medical profession testifies with singular unanimity to this sad truth, common observation corroborates their testimony, and the census adds its statistics to complete the unwelcome demonstration. Moreover, the sterilizing influences, whatever they are, undoubtedly affect the refined classes more strongly than the ignorant and rude. The women who are morally and mentally best fitted to perpetuate and improve the race are precisely those who are physically least likely to do so. It is imperative that the American community should be awakened to the gravity of this danger, and be instructed in the means of avoiding it.

Dr. Clarke's book is a strong presentation of *one* of the chief causes of the evil. A rigorous climate, an unwholesome diet, foolish clothing, indoor life, and the unseasonable excitements of society, all contribute to the disastrous result; but Dr. Clarke, while recognizing the influence of all these causes, purposely confines himself to a discussion of a cause of weakness and suffering in women which is more universal, fundamental, and potent than any other. This cause is the prevalent neglect during girlhood, both at home and at school, or at work, of the most delicate and characteristic part of woman's organization.

Dr. Clarke's argument may be abridged somewhat as follows, though not without doing it injustice: The periodical movements which characterize woman's structure for more than half her life are fountains of power, not hindrances or signs of inferiority; no woman can be symmetrically and completely developed in *any* part of her organization—body, mind, or soul—in whom these most essential and characteristic parts of her structure have been stifled or aborted by neglect. To ensure the healthy development of the wonderfully intricate reproductive system in the woman, it is essential that the girl should always have a remission and sometimes an intermission of labor, study, exercise, and excitement during a part of every fourth week, from about the fourteenth to about the nineteenth year of her life. The amount of the remission, or the length of the intermission, varies with different individuals; but comparative rest, or diminished activity, is a physiological necessity for all girls, however robust they may seem to be. Activity of brain at the period which should be given to rest and repair is quite as dangerous as activity of body. Disproportionate brain-activity exerts a sterilizing influence upon both sexes, but this influence is more potent upon the female than upon the male. The penalties for violating these physiological laws are terribly severe. Headache, neuralgia, hysteria, and a monthly torture which makes life miserable are among the commoner forms of punishment. Barrenness is the extreme penalty. When the evil does not go so far as this, it is, nevertheless, dreadful enough. The influence of her reproductive system upon the character of woman is strong and deep. When one member suffers, all the other members suffer with it. "A woman, whether married or unmarried, whether called to the offices of maternity or relieved from them, who has been defrauded by her education or otherwise of such an essential part of her development, is not so much of a woman intellectually and morally, as well as physically, in consequence of this defect" (p. 91).

Having explained the physiological principles and rules which are involved in this discussion, Dr. Clarke proceeds to illustrate them by actual cases of a typical sort which have occurred in his own practice. The record of these cases is sad reading, but no one can fail to recognize the truthfulness of the descriptions, and almost every one will be able to match them within the range of his own observation. They are so lifelike, or, rather, deathlike, that they will convince anybody whose mind is open that there is great danger in stimulating girls and young women to unremitted mental or bodily activity, and keeping them constantly in a state of intellectual and emotional tension during the period of sexual development. This period coincides with the ordinary period of school life for an American girl, and hence all the methods and processes of schools for girls should be devised with express reference to the periodicity of the female organization.

Instead of this requisite adaptation to the needs of girlhood, Dr. Clarke finds that our methods of educating girls do not give the female organization a fair chance, but, on the contrary, that they check development and invite weakness. The schools for girls have been modelled after schools for boys, and have imposed upon their pupils a boy's regimen, apparently upon the theory that a girl, like a boy, develops health and strength, blood and nerve, intellect and life, by a regular, uninterrupted, and sustained course of work. It is against this fatal theory that Dr. Clarke protests with all the weight of his learning and his experience. He maintains (p. 126) that "girls lose health, strength, blood, and nerve by a regimen that ignores the periodical tides and reproductive apparatus of their organization." Here is the fundamental reason for separating boys and girls in educating them, as soon as the age of puberty is reached. The methods which are safe and judicious for one sex are unsafe for the other. The stimulus which is harmless and even essential for boys is altogether unnecessary and harmful for girls. What Dr. Clarke thinks of identical coeducation for the two sexes may be inferred from the following forcible passages (pp. 135–136):

"Put a boy and girl together upon the same course of study, with the same lofty ideal before them, and hold up to their eyes the daily incitements of comparative progress, and there will be awakened within them a stimulus unknown before, and that separate study does not excite. . . . The first sex to suffer in this exhilarating and costly competition must be, as experience shows it is, the one that has the largest amount of force in readiness for immediate call; and this is the female sex. At the age of development, nature mobilizes the forces of a girl's organization for the purpose of establishing a function that shall endure for a generation, and for constructing an apparatus that shall cradle and nurse a race. These mobilized forces, which, at the technical educational period, the girl possesses and controls largely in excess of the boy, under the passionate stimulus of identical coeducation are turned from their divinely-appointed field of operations to the region of brain-activity. The result is a most brilliant show of cerebral pyrotechnics, and the degenerations that we have described."

Dr. Clarke's book should be carefully studied by every teacher of girls,

* 'Sex in Education; or, A Fair Chance for the Girls. By Edward H. Clarke, M.D.' Boston: James R. Osgood & Company. 1873.

and by every trustee or committee-man who has a voice in the management of a girls' school; but it will not do all the good it is capable of doing unless it is also widely read by American mothers. The physiological laws which Dr. Clarke has expounded are, to be sure, constantly violated in the schools and colleges to which girls resort; but they are also violated quite as dangerously in the homes from which the girls come, and as often in mere pleasure-seeking as in study or other serious labor. American mothers seem too often not to exercise a due control over their daughters at the catamenial period. They sin in this way, sometimes from dense ignorance, sometimes from a reckless inclination to grant their daughters present pleasure, at whatever risk of future pain, and sometimes from an entire lack of effective control over their children. Near the end of Dr. Clarke's treatise is an admirable letter from a German lady about the course which German mothers adopt with their daughters at the catamenial period. It is so compendious and practical a bit of advice that we quote the principal passages (p. 175):

"As soon as a girl attains maturity in this respect, which is seldom before the age of sixteen, she is ordered to observe complete rest; not only rest of body, but rest of mind. Many mothers oblige their daughters to remain in bed for three days, if they are at all delicate in health; but even those who are physically very strong are obliged to abstain from study, to remain in their rooms for three days, and keep perfectly quiet. During the whole of each period they are not allowed to run, walk much, ride, skate, or dance. In fact, entire repose is strictly enforced in every well-regulated household and school. A German girl would consider the idea of going to a party at such times as simply preposterous; and the difference that exists in this respect in America is wholly unintelligible to them. As a general rule, a married woman in Germany, even after she has had many children, is as strong and healthy, if not more so, than when she was a girl. In America, with a few exceptions, it appears to be the reverse; and I have no doubt it is owing to the want of care on the part of girls at this particular time, and to the neglect of their mothers to enforce proper rules in this most important matter."

Some of the people who are already professionally committed as journalists, teachers, or philanthropists to dangerous experiments in female education, experiments costly in life and health if not in money, will doubtless attempt to prevent the circulation of Dr. Clarke's book by denouncing it as indecent or coarse. Those who know Dr. Clarke's character and standing will not need any denial of such a charge; but for the benefit of those who have never before heard of Dr. Clarke, it is proper to say that the book is simply plain-spoken. There are a few jocose remarks in it which are unpleasing in connection with so grave a subject, and the author's aversion to masculine women has betrayed him into the use of a few repulsive, and perhaps unfeeling phrases; but these are trifling blemishes in comparison with the great merits of frankness, clearness, and earnest sincerity. The subject has long needed some plain-speaking by a competent authority. Dr. Clarke is emphatically a trustworthy authority. He was for many years a professor in the Medical School of Harvard University, and is now, by the choice of the alumni, one of the overseers of the university. The fact that he is a general practitioner and not a specialist only adds to the weight of his opinions. A specialist easily comes to think that the whole world is afflicted with the diseases which he treats. No member of the medical profession in Boston stands higher than Dr. Clarke in public estimation, whether as regards scientific attainments, professional skill, or practical sagacity. To question his authority is as useless as to decry his character. Moreover all the eminent physiologists of the world are on his side.

The terrible evil to the cure of which Dr. Clarke hopes to contribute through the teachings of this book presses nearly as heavily upon men as upon women; for in the first place all males as well as all females must be born of woman, and inherit in one form or another the weakness of the mother, and in the next place the happiness and welfare of most men are bound up with the health and happiness of their wives and children. It is a great consolation and encouragement to believe with Dr. Clarke and many other physiologists that the evil, when once apprehended and vigorously combated on true physiological principles, is curable in two or three generations, and the publication of this treatise is in itself an indication that the process of improvement has already begun.

It is so desirable that this treatise should be widely read, by the poorer classes as well as the luxurious, that we regret very much the unnecessarily costly form in which it is published. The matter could have been well printed and sold with a large profit for fifty cents; yet by using thick paper and a narrow page of only twenty-four lines, Messrs. James R. Osgood & Co. have made it up into a book for which it does not seem wholly preposterous to ask a dollar and a quarter. We hope that a cheap edition will be published at once.

The Perfect Horse. By Rev. W. H. H. Murray. (Boston: J. R. Osgood & Co.)—Mr. Murray has given us a volume on a subject which might be supposed to be somewhat out of the line of a minister of the Gospel, and which, like his former work on the Adirondacks, will be apt to mislead those who go to it for information, though perhaps in a less degree. Its title would more properly indicate the aim of the author if the word "trotting" were inserted after "perfect," as it is in this particular branch of the horse business that Mr. Murray finds his specialty and his sphere as an instructor. He starts off by proposing to point out the marks which characterize the perfect or ideal horse, and to do it in so plain a manner that hereafter any one who knows his rules, and observes them, can, even at a casual glance, recognize the merits and failings of the animal he contemplates purchasing, and fix certainly and immediately the value, set the wiles and arts of horse jockeys and copers at naught, and acquire in an hour a knowledge the want of which has, we dare say, cost much money and bitter reflection to many of Mr. Murray's lambs, if they share the tastes of their pastor. After a few pages of instruction on the different kinds of temperament in horses, Mr. Murray gets at the real substance of his work in treating of the form, disposition, etc., to be selected in breeding horses for trotting purposes. His argument can scarcely be termed inductive, as he has taken as his ideal the Morgan family of horses, with which his earthly fortunes are linked, and makes strength in the characteristics of that family the test of perfection. Mr. Murray is careful to state in his preface that he does not mean to advertise any particular strains of blood in his book, and we can only suppose that the ownership of two stallions of the Morgan stock has unconsciously led him to devote so large a portion of his space to panegyrics on this New England family of trotting-horses and defamation of their rivals.

The Morgans—in which sweeping appellation Mr. Murray includes nearly all the New England families of trotters, descended from a horse called Justin Morgan, which died early in the present century—are generally small, though full of nervous energy and vigor, and, while they have distinguished themselves on the turf, are not to be compared in the particulars of speed or endurance in trotting with the descendants of Messenger, a thoroughbred race-horse of great repute which was imported here from England, and did service in the stud at the same time as did Justin Morgan, the ancestor of Mr. Murray's two stallions. Our best trotters and many of our best race-horses are descendants of Messenger, and his immediate and remote issue are noted, as he himself was, for great hardiness of constitution and invincible determination. Mr. Murray, on p. 300, gives us a compilation of forty-nine of the descendants of Justin Morgan that have trotted a mile in 2:36 and faster, by the record, and immediately afterwards states that "the family of horses which has been distinguished by and embodied the four great essentials of the perfect horse—beauty, docility, endurance, and speed—is the Morgan." We will look a little into the question of speed, on which Mr. Murray lays the greatest stress. In the list of trotters above-mentioned, which contains errors of omission and commission, the most glaring blunder is in giving Ethan Allen's time as 2:15. That he trotted in this time is true, but it was in an unusual manner, he being harnessed with a running mate, which not only pulled all the load, but Ethan Allen as well. Under these circumstances the horse was very much like a boy running behind a wagon of which he has hold, and by the help of which he can run much faster than he could alone. The fastest Ethan Allen has ever been able to go, drawing a sulky, is about 2:25, and his 2:15 is not admitted as a trotting record. The next fastest time on the list is by Rolla Golddust—2:21—and was made under the saddle, a much faster way of going than in harness, though this fact is suppressed. The fastest time of this horse, drawing a sulky, is about the same as Ethan Allen's. Of the remainder of the forty-nine horses named, ten of them have the blood of Messenger in their veins, and the best of them have more of that than of the blood of Justin Morgan. On the other hand, not going back so far as imported Messenger, we find at least ten of his descendants through Hambletonian, a horse now living, that have trotted faster in single harness than any in Mr. Murray's list, and none of these have, so far as known, a drop of the Morgan blood. Moreover, of all the horses which have ever trotted below 2:20 (and a horse must do that to be considered first-rate now), one half are of Hambletonian descent and none of Morgan.

On p. 338, we find that Hambletonian's best sons (for breeding purposes) "are out of 'Star' mares, or thoroughbreds of other families." Now Mr. Murray evidently considered American Star, the sire of the "Star" mares, a thoroughbred, as he gives his pedigree several times as by Henry, which is a mistake. But it is a well-known fact among breeders that no son of Hambletonian from a Star or thoroughbred mare has yet distinguished himself in the stud. Perhaps the most remarkable crotchet ventilated in the book is on pp. 127 and 128, where Mr. Murray proposes, and gives many reasons for doing so, to broaden the present definition of "thoroughbred," by making it include any animal that is handsome according to his ideas of equine beauty and is possessed of "power of endurance and desire to do." To appreciate

the extreme coolness of this proposition, we must remember that an animal to be "thoroughbred" must trace back on both sides to five generations at least of pure blood, and that the term was originally used in England for horses of the highest lineage, brought there from the East, which became the ancestors of their and our families of thoroughbreds. Mr. Murray might as well profess to be a member of the French Academy because he is a literary man, or of the Royal family of England because he is as athletic as some of its members.

The instructions about breaking colts are good, and those on the foot and shoeing show that the author has adopted the best and most sensible views. The remarks on the structural formation of the horse are also worthy of careful study by those interested in the subject. Mr. Beecher's introduction and Mr. Loring's supplement, which is quite long, are both good and amusing. The book closes with tabulated pedigrees of twenty-nine noted horses, among which we notice seven given incorrectly; instructions for laying out a mile track; and a "gallery of celebrated horses," in which Mr. Murray's two stallions figure of course.

The Atmosphere. Translated from the French of Camille Flammarion. Edited by J. Glaisher, F.R.S. With ten chromo-lithographs and eighty wood-cuts. (New York: Harpers. 1873. 453 pp. 8vo.)—Both of these gentlemen are eminent aeronauts, Mr. Glaisher having ascended to an elevation of thirty-seven thousand feet—the highest on record. The chromo-lithographs are the most praiseworthy feature of the book, one of them, representing a sunrise on Mount Righi, being more pleasing than most landscape paintings. But in the titles of the woodcuts the author's contempt for accuracy appears. Thus, one view is named "Ice *at* the North Pole," teaching that that place has been seen. But M. Flammarion sacrifices truth about all other subjects for the sake of brilliancy in emphasizing his point at the moment. A specimen occurs on p. 18: "Situated as we are about the globe, infinitely small *mollusks*"! The author's style is pompous, vague, and unballasted. The editor in his preface makes confessions not calculated to encourage intending purchasers: "It is impossible for any one man to have a complete knowledge of so great a variety of subjects as are treated of by M. Flammarion, and the compiler of such a book must include many things taken from others, of the accuracy of which he is not fully competent to judge." "Every one who is acquainted with French popular works on science is aware that very many exhibit a tendency to imaginative . . . writing, which ill accords with the precision and accuracy that ought to be a characteristic of scientific information." The editor should, perhaps, rather have styled such writing fanciful than imaginative, for it is the author's gravest defect that he is destitute of scientific imagination; otherwise he would not have endorsed as "probable" several whimsical notions such as that "a detached train of the lighter gases remains constantly in the rear of the globe during its rapid revolution around the sun." His lack of imagination is impartial; it rejects as blindly as it admits, so that the hypothetical portions of the work are simply worthless.

The arrangement, as usual in compilations, is merely topical; the choice of subjects is adapted to attract; a flash of lightning is gilded upon the binding.

Fine Arts.

THE METROPOLITAN MUSEUM.

THE LOAN COLLECTION.—I. EUROPEAN CERAMICS.

THE complete property of the Museum is now assembled in Fourteenth Street, together with an interesting and generous loan collection. The possessions of the Museum include the pictures by the old masters, bought a year and a half ago, and described by us at the time, and the Di Cesnola antiquities, also passed in review before our readers. Both of these collections are now improved—the gallery with two or three additional pictures of value, and the Cyprus statuary by the careful and methodical arrangement of the discoverer himself. The loan collection, considerably reinforced during the summer interval, is now the prominent novelty. It includes old and new paintings, statuary, and several rooms full of virtù. The latter, not yet catalogued, is decidedly rich and choice; and as one's ideal of a loan collection begins, if it does not end, with *bric-à-brac*, we will pass by the artistic sublimities to commence frankly at the chinaware.

Potteries from Asia and potteries from Europe are piled in a number of cases upstairs and downstairs. Their classification is done in the visitor's head. The materials for a tolerably full lesson in European ceramics may be gathered by piecing together the specimens from the different cases; these, being arranged according to owners, instead of by any scientific system, afford a wholesome exercise to the mind, and shrewdly tax the memory of the eye.

The fine memorial case furnished from the collection of the late Mrs. Prime shows European porcelain at its beginning, in the ware of Böttcher; this, with its warm white hue and exceptional heaviness, may have come to us from the artist's luxurious prison in the castle of Meissen, where he was tied to his craft in petted slavery by August the Strong. To pass from this ware to the specimens of Italian majolica—and it is singularly easy to bestride international boundaries in the collection—is to find a harsher material and a superior art. It is curious to think what new perfections might have been reached, by painters like those of the so-called "Raphael ware," and statuaries like Della Robbia, if they could have found a material so obedient, so beautiful in itself, and so flexible in expressing the artist's most delicate shade of meaning, as the kaolin of Dresden. A contribution of Gubbio ware, from the estate of Mrs. Prime, instances the florid development of ceramic industry in the Duchy of Urbino, where Maestro Giorgio brought up his lead glazes to their most admirable mother-of-pearl lustre. Doccia ware, with its purity and intensity of tin glaze and elevation of form, associates ceramics directly with the art of sculpture, through the great name of Luca della Robbia, to whose school the Florentine pottery belongs. By Luca there are two or three large and fairly good pieces, one of them unfortunately much patched; that of the Madonna kneeling before her child, who lies among lilies, while a crown descends upon her head and two adoring cherubs watch the scene, is full of the artist's mystic grace; the other, in which the girl-mother caresses her babe, is more severe and monumental. Some imposing specimens of the great Italian buffet-pieces, the "piatti di pompa," are lent by Mr. S. L. M. Barlow; among his majoliche may be mentioned the Bassano plate with imitation of Persian decoration in pinks and violets; the Pesaro dish, with Baptism of the Virgin in many figures; a Faenza plate, with white ground, another of Castelli ne' Abruzzi; a dish of white perforated pattern with coat of arms; a dish of Treviso; and the large platter completely covered with a design of St. George and the dragon, and marked with the letter S. This group of Central-Italian pieces, with their bold, loud style, daring Renaissance models, large scale and rich color, are highly effective. In the Prime collection, a white glazed statue of Capo di Monte, and another Naples specimen—a plate showing a border of white and black, resembling an inlaid pattern of ivory on ebony—personify the impulse of South Italy. The porcelains of France are but imperfectly exhibited; we notice no contributions of Palissy pottery, and there are more gaps than stepping-stones until we come down to modern Sèvres, from which *fabrique*, under one of the late superintendents (Brongniart), there is an elaborate dinner-set; the plates are painted with antique heads, in arbitrary camaïeu colors; the dessert dishes are encircled by a band of very rich yolk-of-egg yellow; a set of accompanying vases are adorned with highly finished miniatures of Louis XI., Francis I., and Henry IV.

The lessons originally due to Böttcher, and spread through Germany from the great centre of illumination at Dresden, are shown in a selection of specimens; there are pieces from the works (peremptorily established under experts transferred from Dresden by Frederick the Great) at Frankenthal and Höchst. The independent school existing since the fourteenth century in Holland, and a direct result from that nation's ancient traffic with Japan, is partly represented in the scattered pieces of Delft ware. Some of the last-century Dresden is adorned with the daintiest miniature painting; and a curious study of taste is afforded by the various and often fantastic decoration of the ware from Berlin, Fürstenberg, Marienberg, Ludwigsberg, and Nuremberg. The English potteries, save for one great name, do not in this collection make any great show; there are scattering pieces of Liverpool, Crown Derby, Worcester, Lowestoft, Chelsea, Copeland; but British credit is redeemed only in the exhibition of the various *chefs-d'œuvre* of Wedgwood, Staffordshire, including numbers of the Flaxman bas-reliefs, and a specimen, lent by H. G. Marquand, of Wedgwood's fac-simile of the Portland vase. Of all the pieces we have mentioned, not many would seem in a European museum immensely rare; but when we remember that they are simply such bits as can be spared from a good many private collections, and how fragile they are, how far from the scattered lands where they were born, and what hardy travellers they in their fragility have been through the chances of the seas, we must admit that they make a very creditable group, and a nucleus for a really valuable study of what may be called comparative pottery.

The Egyptian pottery, of which Mr. W. C. Prime lends a small but select group, includes a specimen which that gentleman asserts to be the oldest piece of glazed pottery with fixable date that he has seen; it is an elongated bead, covered with glass glaze, and assigned to the period of Amon'm'he III., fifth king of the XIIth Dynasty, at a date of about 2020 B.C. This vitreous enamel, almost choking the finer lines of the model, is seen in blue and other

colors on many of the little sacred images derived from tombs, and on many of the bead necklaces and ornaments accompanying mummies, a quantity of which are visible in this case. A very comical statuette from Es-Siout, on the other hand, is as modern as possible, being the contemporary Egyptian carver's notion of a Frankish lady; this small creature is strutting, with her chin in the air, mounted on a pair of high heels, and adorned with the ruff, the hat, the ear-drops, and overskirt of our own day; and a wonderful air of patronage she seems to wear in the face of the Pyramids. To balance this, we may smile at the dish made at Nankin in Queen Anne's time, and painted (as was the fashion) from an English design, in the large collection of old Chinese blue contributed by Mr. Robert Hoe, jr.; the device, traced with all the national fidelity, through which, however, the Chinese habit of hand is everywhere apparent, shows a kind of Pamela or Clarissa Harlowe mildly entertained by a couple of beaux resembling parsons, who play the flute and guitar for her diversion; the inevitable Eastern look, pervading the truly British ceremoniousness of the scene, almost caps the climax of absurdity: yet an English artist of the day would hardly have imitated a Chinese print so well. The richness of Mr. Hoe's collection in blue is rivalled by that which forms a part of Mr. Avery's loan; the extreme elegance both of design and color seen in Mr. Avery's cabinets of azure, and the liberal number of the pieces, offer unusual chances for comparison and study. In the same loan has been put together, with rare taste, a mass of Japanese and Chinese porcelains in the rarer hues, the éclat of the colors being much enhanced by felicity of arrangement; here we see deep blues, liver-color, ruby, and other fine tints in profusion, particularly one tiny bottle in mustard-color; crackle-ware, in its various caprices, is illustrated in the same contribution—the pattern being sometimes very large and open, sometimes minute as fine net, sometimes gradually shaded from large to fine over the surface of a single vessel, sometimes restricted to certain zones of a vase, while intermediate portions are completely clear; one tasteful specimen shows enamelled blossoms fixed upon the angles of a very open crackle, whose dark zigzags thus form the branch-work of a flowery composition. Most of these rarities, however, must yield in importance to the noble old porcelain vase of the Tching-hoa period, of the fifteenth century, lent, we believe, by Mr. Barlow. This object, which at first sight looks like a moulding in chocolate, is in perfect preservation, the light playing over its pure dark surface as over bronze seven times polished; it is nearly eighteen inches high; the shape, imitated from a gourd bottle, and severely simple, reveals better than a more elaborate one the fine state of the specimen, and its immunity from flaw.

The application of ceramics to architecture is a subject of great and growing interest, especially in this country, where carved decoration is almost excluded from its expensiveness, and where the problem of the immediate future will be to get all possible effect out of decorative brick-work. This consideration, and the imperishableness of pottery in all climates, give special value to the few tiles and to the Chinese architectural ornaments; by the latter we refer to the half-dozen fragments of the Porcelain Tower at Pekin, whose last overthrow affords us these valuable studies of baked ornament. The effect of the strange animal forms, revealed at intervals through the confusion of leaves and scrolls, is highly piquant; it points to a possible realism in the decoration of edifices which perhaps only needs a little audacity and taste to be popular. Every color in nature seems to be almost equally in the resources of these Chinese potters; and we have only to learn their art and follow the hint of their architects to dress our buildings, if we so choose, in flowers and creepers of unfading bloom, with birds perching or mosses spreading, in the perfection of natural color. From such realistic motives of ornament our choice spreads all the way to the spiritual elevation of Luca and Andrea della Robbia, who, while they hung many a garland of plastic fruits and flowers over the walls of Florence, and covered the house-fronts of her nobles with escutcheons as large as cathedral windows, had the secret of making pottery no less dignified than marble, as repeatedly shown in the sacred statuary and alto-reliefs still remaining in the churches of the city. These white figures leaning out of spaces of sky-blue are more austere, perhaps, for their reticence of color, but not necessarily purer. Meantime, colors idealized or spiritualized by their strange haunting iridescence are afforded by the Saracen and Hispano-Moresco potteries. A few Persian and Saracen tiles, one of which is from the Mosque of Omar, have strayed into this collection, where they have a dispersed and lonely look. Their vitreous glazes are a hard and a stimulating lesson to the brick-maker. As soon as the present timid attempts to introduce tiles, colored reliefs, and terra-cotta friezes into architecture have become firmly embraced by the public understanding, the day of audacities and experiments will be sure to follow, out of which we may be sure some novelty will spring visibly adapted to modern times, and affording inevitably a great rôle for pottery.

MILL'S MISCELLANEOUS WORKS.

UNIFORM LIBRARY EDITION.

Tinted and laid paper, 8vo, $2 25 per vol. (except vol. on Comte).

THE AUTOBIOGRAPHY. 1 vol.

DISSERTATIONS AND DISCUSSIONS. 4 vols.

CONSIDERATIONS ON REPRESENTATIVE GOVERNMENT. 1 vol.

EXAMINATION OF SIR WILLIAM HAMILTON'S PHILOSOPHY. 2 vols.

ON LIBERTY; THE SUBJECTION OF WOMEN. Both in 1 vol.

COMTE'S POSITIVE PHILOSOPHY. 1 vol., $1 50.

CHEAPER EDITIONS.

REPRESENTATIVE GOVERNMENT. 12mo, plain, $1 50.

ON LIBERTY. 16mo, plain, $1 25.

THE SUBJECTION OF WOMEN. 12mo, plain, $1 25.

MEMORIAL VOLUME.

JOHN STUART MILL: His Life and Works. Twelve sketches by J. R. Fox Bourne, W. T. Thornton, Herbert Spencer, Henry Turner, W. Minto, J. H. Levy, W. A. Hunter, J. E. Cairnes, Henry Fawcett, Mrs. Fawcett, Frederic Harrison. 16mo, price $1.

HENRY HOLT & CO., N. Y.

HARPER'S CATALOGUE. The attention of those designing to form libraries or to increase their Literary Collections, is respectfully invited to Harper's Catalogue, which comprises a large proportion of the standard and most esteemed works in English Literature—*comprehending over three thousand volumes.*

Librarians, who may not have access to a trustworthy guide in forming the true estimate of literary productions, will find this Catalogue especially valuable for reference.

The Catalogue is arranged alphabetically by the authors' names, anonymous works by their titles. The index is arranged by the titles of the books, besides having numerous appropriate heads, each general head being followed by the titles of all works on that subject.

Harper's Catalogue sent by mail on receipt of six cents.

Address HARPER & BROTHERS, Franklin Square, New York.

THE MONEY PANIC.

NICHOLSON'S

SCIENCE OF EXCHANGES,

FOURTH EDITION,

gives full and concise information on all financial questions and the basis of commercial transactions.

Free by mail, price $2 50. 8vo, 220 pages.

"In a little book called 'The Science of Exchanges,' by N. A. Nicholson, M.A., of Oxford, there is packed much more information about coins, currency, prices, money, value, and exchange than it falls to the lot of most men, even of so-called 'financiers,' to know. Cassell, of London and New York, is the publisher."—*N. Y. Paper.*

CASSELL, PETTER & GALPIN,

596 Broadway, New York.

LIBERTY, EQUALITY, FRATERNITY. Price $2.

"We strongly recommend 'Liberty, Equality, Fraternity' to all who are interested in the study of Political Philosophy."—*Athenæum.*

"It can only be added, therefore, that in style and narrative the book reminds one somewhat of George Eliot's 'Scenes of Clerical Life,' and will not sustain a very unfavorable comparison with them."—*Cincinnati Gazette.*

THE THIRD THOUSAND.

HESTER MORLEY'S PROMISE.

BY HESBA STRETTON,

Author of 'The Doctor's Dilemma,' 'Bode's Charity,' etc. $1 75.

DODD & MEAD, Publishers, New York.

"The faithful novel-reader, weary of the stereotyped heroine and society novel, may turn to 'Hester Morley's Promise' with confidence and hope. The reading of it cannot fail to give pleasure, it is written in a style so fresh and bright."—*Publishers' Weekly.*

CRITICAL AND SOCIAL ESSAYS. Reprinted from the *Nation*, and in some measure supplying the place of the first two volumes of the paper, now rather scarce. Cloth, 12mo, price $1 50. Sent, post-paid, on receipt of price by the Publisher of the *Nation.*

THE WEEK IN TRADE AND FINANCE.

NOVEMBER 10.

ADVICES from London since our last have continued unfavorable. The Bank of England rate of discount was raised to 9 per cent. on Friday, and there is every probability that it will soon again be advanced. These advances in the bank rate have been precautionary, and made for the purpose of preventing a further outflow of specie from the Bank as well as attracting foreign capital toward London. It is probable that, with the high rate of interest for money prevailing in London, considerable amounts will be sent there from Germany. The specie in the Bank of England decreased during the week ending Thursday last £73,000, and the total specie reserve of the Bank is now stated to be under £20,000,000—a point below which it has never passed without causing anxiety.

The financial situation during the past week has improved, but at times the news which came from Philadelphia regarding the condition of certain parties there, connected with the Pennsylvania Railroad Company, and that the latter might not be able to pay the regular half-yearly dividend, exerted a depressing influence. On Wednesday, the news came that the paper of the California and Texas Construction Company had gone to protest. This company was engaged in building the Texas and Pacific Railroad, and the paper protested bore the endorsements of Mr. Thos. A. Scott and other gentlemen connected with the Pennsylvania Railroad Company. The failure of the Construction Company was brought about by incurring liabilities to the amount of some $7,000,000, for $4,500,000 of which the paper of the company, maturing within the next twelve months, was issued. Mr. Scott recently went to Europe to negotiate the first mortgage bonds of the Texas and Pacific Railroad Company, with the proceeds of which these floating liabilities of the Construction Company could be met; but, failing in his efforts to place the bonds, he returned to this country in time to see its financial collapse. Fortunately, the paper is held by wealthy parties, who can afford to lose. A meeting of creditors will most likely be held at an early period and an extension granted to the company. The troubles of the California and Texas Construction Company gave rise to unpleasant rumors about the Pennsylvania Railroad Company, and naturally so, as the leading officers in each corporation were the same; but these rumors were denied, and there is no reason to think that the troubles of the former have in any way affected the latter. On Friday, the question as to the payment of the Pennsylvania Railroad dividend was set at rest by the declaration of a 5 per cent. scrip dividend, redeemable March 1, 1875, the company having the option of redeeming it at any time after six months.

The creditors of the A. & W. Sprague Manufacturing Co. and A. & W. Sprague, of Providence, have consented to the appointment of trustees to take charge of the assets of the above-named concern, and a committee of five were appointed to take charge of the creditors' interests, and to name three parties to act as trustees, which they have done. The gentlemen selected as trustees have consented to serve, and are acceptable to both creditors and debtors. Messrs. H. B. Claflin & Co. have asked for and received an average extension of four and a half months on open accounts, and are at work putting themselves into shape to meet promptly their engagements when they again fall due. Messrs. Peake, Opdycke & Co. have resumed business, and affairs generally are in a more satisfactory condition than they were at the close of last week.

Money on call among stock brokers has been obtainable at 7 per cent. gold, though loans have been made both above and below this rate. Commercial paper is very dull, with rates nominal.

The banks have further strengthened themselves by the addition of legal tenders and gold to their reserve. The banks are said to hold at present $23,210,000 legal tenders, and $16,767,000 gold, making a total reserve of $39,977,000, against $151,000,000 deposits and $28,000,000 circulation, or a total of $179,000,000 liabilities. Besides the above amount of liabilities, the banks have outstanding $22,000,000 loan certificates, which, if counted in with the other liabilities, makes a total of $201,000,000. A reserve of 25 per cent. in legal tenders and specie against this amount would be $50,250,000, while the banks hold only $39,977,000, thus showing that they are still $10,273,000 below the legal requirement. Leaving out the loan certificates, the banks are but $4,733,000 below their legal reserve.

In the stock market there is little to notice beyond a general weakness, which was occasioned by the Philadelphia rumors and troubles before alluded to. The expectation of a further advance in the Bank of England rate of discount, and the apprehension of trouble on the other side, have cast a gloomy feeling over the market. Prices, however, closed on Saturday at nearly the highest point of the day, which was due to the covering of short contracts by parties who did not care to go over Sunday with any interest in stocks.

The following shows the highest and lowest sales of the leading stocks at the Stock Exchange for the week ending November 8:

	Monday.	Tuesday.	Wed'day.	Thursday	Friday.	Saturday	Sales.
N. Y. C & H. R...	80⅛ 83⅜	Holiday.	77⅜ 81	78 80⅜	77⅜ 80	78¾ 80	122,200

The Government bond market is lower, in sympathy with the lower price of gold here and the depression in the London market. In railroad bonds, a very moderate amount of business was transacted, and prices have remained steady. Holders of good bonds evince no disposition to sell at current market quotations. The *Financial Chronicle* gives the following list of bonds, the coupons upon which were passed November 1:

	Interest payable.	Place of payment.
Burlington, Cedar Rapids & Minnesota gold 7s.....	$189,000	N. Y. or London.
Burlington & Southwestern 1st mortgage 8s	72,000	Boston.
Chesapeake & Ohio 1st mortgage gold 6s.....	450,000	New York.
Chicago & Michigan Lake Shore 8s of 1871.....	54,000	Boston.
Kansas Pacific:		
First mortgage land grant gold 7s.....	225,925	N. Y., London & Frankfort.
Leavenworth Bridge 7s	21,000	N. Y. & St. Louis.
Leavenworth, Lawrence & Galveston:		
Kansas City & Santa Fé 10s....	36,000	Boston.
New York & Oswego Midland:		
Second mortgage convertible 7s.....	87,500	New York.
Second mortgage non-convertible 7s	52,500	New York.
Peninsula of Michigan 1st mortgage gold 7s.....	97,265	New York.
Port Huron & Lake Michigan 1st mortgage 7s.....	63,000	New York.
St. Louis & St. Joseph 1st mortgage gold 6s.....	30,000	New York.
St Paul & Pacific:		
First mortgage main line land grant gold 7s.....	105,000	London.
Second mortgage main line land grant gold 7s.....	210,000	London.
Union Pacific, Central Branch, 1st mortgage gold 6s	48,000	New York.
Total.....	$1,741,190	

Gold has further declined, and on Thursday the lowest point since June, 1862, was reached—106⅛. The demand for coin is very light, both for mercantile and speculative uses, and has gone down, as any other commodity does, when there is no use for it. The raising of the Bank of England discount rate caused a reaction from the low price of Thursday, and sales have since been made as high as 107¾. The range of fluctuations during the week was between 106⅛ and 107¾, closing at 107½ on Saturday.

FOREIGN BOOKS Reviewed in the *Nation*, and books in all languages, at SCHOENHOF & MOELLER'S, Importers, 40 Winter Street, Boston.

The London *Spectator*, at the close of a review criticising severely 'LIBERTY, EQUALITY FRATERNITY,' calls it—
"*One of the strongest books by one of the strongest men of our day.*"

DON'T BURN UP! The Tunnicliffe Patent Fire Alarm is a small Instrument to be placed on the ceiling of your room. A fire in an adjacent building, or generated accidentally in the room, will cause an alarm. Samples, $1. Address 697 Broadway, New York.

The Nation.

NEW YORK, THURSDAY, NOVEMBER 20, 1873.

The Week.

ON the morning of the 7th instant, Captain Fry and thirty-seven of the crew of the *Virginius* were shot at Santiago, and though the accounts are conflicting, it seems pretty clear that most of the prisoners have been disposed of in the same way. The address of General Burriel to his soldiers confirms our previous accounts of the capture of the vessel. The *Virginius* did not offer any resistance, but made every effort to escape, the crew throwing overboard a quantity of arms to lighten the vessel; or, as General Burriel puts it, "The *Tornado* belched forth flames instead of smoke, going at her fullest speed. She finally came up with and captured the *Virginius*, which was taken possession of, with repeated cries of '*Viva España*' from the *Tornado's* valiant crew, without the slightest resistance from the others. One hundred and sixty-three men delivered themselves quietly up, having cravenly thrown overboard during the chase the arms which they ought never to have grasped, and the military equipage confided to them to defend their ignoble cause. This goes to show and to confirm the poverty of our enemies' efforts, and to demonstrate their impotence against the armies of Spain, which Providence manifestly favors." The chase began about eighteen miles from the coast of Cuba, according to the official reports, and lasted eight hours, so that when the *Virginius* surrendered she must have been very near Jamaica, the shortest distance between the two islands being about seventy miles.

In the meantime, it is fair to suppose that the "excitement" which the telegraph tells us is raging in every part of the country, but of which nobody appears to have seen anything yet, will not hurry the Administration into acts of hostility before it is ready for war. A naval Bull Run affair would be a serious matter, which neither Banks, nor Cox, nor even A. Oakey Hall could set to rights. It must not be forgotten that we have, according to the best authority, no navy. Nothing is worth counting as navy in our day except iron-clads, and of our iron-clads only eight, the *Ajax, Dictator, Mahopac, Manhattan, Miantonomah, Roanoke, Saugus*, and *Terror*, mounting in all twenty-four guns, can be made fit for sea. It would probably take from three to six months at least to get them ready, and, when got ready, they could not stay out on the open sea with safety. Of our twenty-six wooden steamers there is little use in talking, when Spain has eleven iron-clad frigates of the first-class, with all the modern improvements. She has in Cuban waters alone forty-five vessels, carrying 762 guns and 13,000 men. Any rash entrance on hostilities might, therefore, result in a check which would leave our ports at the mercy of the enemy, and produce a most disastrous effect on our commerce and finances. We hope that the people who are getting "excited" over the Cuban affair will think of these things. "The People Aroused," "The People's Voice," "Vox Populi," "America Arming," and "A Burst of Wrath," are the descriptions of the situation given by the *Times, Sun, Herald, World*, and *Tribune*. The Cincinnati *Gazette* says that there is a fearful excitement at all the telegraph stations and all the newspaper offices throughout the entire Western country, but that the persons who are "excited" keep themselves concealed.

A great crowd assembled on Monday evening at Steinway Hall to protest against the shooting of the *Virginius* prisoners. Resolutions were adopted calling upon the Government to take prompt and decisive measures against Spain. The chief speech of the evening—indeed, the only speech which was worth listening to—was Mr. Evarts's, which was reported in full in the morning papers. It would be difficult to give any one who was not present an exact idea of the sentiment of the meeting; but we may say that it was decidedly the most cheerful and hilarious war-meeting we have ever had the pleasure of attending. There was a good deal of confusion and laughter among the audience, hisses for Hamilton Fish, derisive enquiries addressed to any one who happened to be on the stand, and much shouting of a vague sort. Towards the end of the meeting Mr. George Francis Train was discovered on the floor, and the most vigorous efforts were made by disinterested persons to get him to address the meeting, which he seemed very unwilling to do. The demand for him, however, became noisier and noisier, until Mr. Train retreated from the prominent position which he occupied, and the meeting was suddenly adjourned. A number of martial airs were played upon the organ—an instrument not so well suited to stimulate the war-feeling as a brass band would have been. Altogether, however, the meeting was a great success, and another meeting was held round the corner at Tammany Hall, for the benefit of those who were crowded out of Steinway. The principal meeting was organized by the Cuban Junta. All allusions to international law were coldly received, but the most tremendous applause was elicited at any mention of war, carnage, blood, slaughter, humanity, civilization, or progress.

General Garfield and Senator Sherman, who is Chairman of the Senate Finance Committee, have made public their views with regard to the coming session of Congress. They are both of opinion that the House will do some reckless work, but General Garfield thinks that there will probably be so many schemes of inflation introduced that they will die a natural death in their struggle with each other; while Mr. Sherman is of opinion that, if this struggle for existence among the inflation schemes in the House results in the survival of any, these survivors will be given a *coup de grace* by the Senate. Senator Sherman's opinions on this subject are of course of importance, particularly as he has hitherto been supposed to be something of an inflationist himself. As we said the other day, hardly any prominent politician at Washington dares to avow himself an inflationist; and in view of the preparations for a foreign war now going on, it is important for everybody to notice the fact that for the quarter ending September 30, the revenue exceeded the expenditures by $6,000,000. During October the revenues fell off $3,000,000, and for this month the decrease, it is said, will be probably $5,000,000. Since October 1, the expenditures have exceeded the receipts. At the same time, the estimates of receipts from customs and from internal revenue will be less by several millions than last year, while the estimates from the departments will exceed those of last year by about $10,000,000. This statement, taken from the *Tribune's* Washington correspondence, is, in the main, reliable, and as to the estimated expenditure probably under rather than over the mark.

The *World* has recently been a good deal moved by the impudence of the *Times* of this city, which one short year ago used to denounce the *World* for factiousness because the latter journal felt obliged to publish articles in which it showed that the Grant Republicans were keeping on foot many ports of entry which were obsolete as regards commerce, and were merely ports of refuge for Republican political hulks, who were expected to do no other duty than draw their pay and work at primaries. Thus, in numerous articles it showed that there was a port in Maine called Frenchman's Bay where the receipt of customs was $36 45, while the cost of collection was $6,783; another called Kennebunk, where the receipts were $6 25, while the cost was $1,279; another, York by name, where the receipts were nothing at all, and the expenses were $368 39; and that all told there were in Maine twelve ports at which the sum-total of the customs expenses was in excess of the total receipts by almost $22,000. But at all these articles the

Times used to laugh, which, however, does not prevent its now having the nerve to come forward with denunciations of "what are facetiously called collection districts," and throwing the *World* into a condition of excitement. But to most people this will seem a fair reward for the *World's* suppression of the fact that custom-houses are good to prevent smuggling as well as to collect dues from importers and feed and clothe "Radical hulks," and for its concealment, for its own immediate purpose, of the fact that the prime cause of our inordinate numbers of custom-houses is not the *Times*, nor the collectors of the port at Frenchman's Bay, but the tariff which we maintain. In this view, we may add, the *Times's* support of Mr. Secretary Richardson's proposal to cut off a few custom-houses here and there is rather a bit of partisan subserviency to suggestions from headquarters than evidence of any care for reform or of its desire to flout its contemporary. It is not by retrenchments of the size of the one proposed that the XLIIId Congress is to give the country any relief.

Affairs have taken a decidedly upward turn, not in Wall Street only, but all over the country. There is not going to be any panic in England; nine per cent. is bringing bullion back into the vaults of the Bank of England; and if trouble does not come to us from Paris and Berlin, which is not likely, we are out of the woods. There has been only one "disquieting rumor" and two "malignant rumors" in Wall Street during the week. The former was a story of Vanderbilt's death, which, though it has been frequently used before for stock-jobbing purposes, was again successful in causing some people to rush out and begin selling their property. The latter were stories of a defalcation to the extent of $600,000 in a Western railroad, which finally dwindled down to a disputed account of $100,000, which was settled before the story got afloat of a New York bank having got into trouble owing to injudicious loans, and of the failure of a London house "heavily laden with American securities." This "London house" has been failing or going to fail every week for the last two months, and it owes it to the public to come down without further postponement. Its name is never revealed, but we should say, on general principles, that it was "Harris."

The report of the Committee of Nine of the Associated Banks on Banking Reform contains a valuable account of the actual condition of the business of banking in New York. The report chiefly deals with the practice of paying interest on deposits, which the committee says works in this way: The country banks, which are required by law to hold 15 per cent. of their liabilities as a reserve, in order not to lose money on this amount deposit say three-fifths of it with the New York banks, which are required to keep a reserve of 25 per cent. of their own liabilities, of which these country deposits now form a part. The New York banks, having secured this country reserve, immediately lend it, or a great part of it, and the result of all these operations is that when the usual autumn "tightness" of the money market comes round, instead of there being a reserve of 25 per cent. in the New York banks, and 15 per cent. in the country banks, there is about 10 per cent. in New York as a reserve for the whole system. The committee accordingly recommends the prohibition of interest on deposits. There is another difficulty, however, connected with the same subject. The New York banks may keep their 25 per cent. reserve either in gold or greenbacks, but experience proves that gold in a crisis is of no use, and the committee recommends that the banks be required to keep at least 15 per cent. in currency. They also recommend that no banks shall be allowed to certify checks without funds to the credit of the depositor to make them good; that drafts on Clearing-House banks only shall be received on deposit as cash; that checks and drafts on country banks shall be taken at rates of discount fixed monthly by the Clearing-House.

There is, however, a strong probability at this writing that a large number of banks will refuse to adopt the conclusions of the report, or to belong to a Clearing-House Association whose regulations are based on them. Banks which have had millions of deposits, on condition of paying interest on them, are hardly likely to relinquish suddenly and voluntarily the practice of taking them, and will naturally conclude, as we all do, that as it is now sixteen years since the last panic occurred, it will be at least as long before another occurs, and that in the meantime something will turn up. So, also, the banks which do most of the brokers' business, and find it profitable, are very unwilling, and would find it very much to their disadvantage, to give up certifying checks for them in the absence of deposits, and are not likely to do so, the legal prohibition in any wise notwithstanding. They all say that they know their own business best; that what they need is to be let alone, and relieved even from the legal restriction as to their reserve, and they talk of forming a Clearing-house of their own, in which they will do as they please about interest and certification. Should a split of this kind occur, the probability is that the distinction between interest-paying and certifying banks and the more conservative ones would become marked in the public mind, and the balances of prudent people would probably flow into the latter.

The November elections, so far as they concerned the Grangers, resulted as follows: In Wisconsin, Taylor, the Grange nominee for Governor, who was supported by the Democrats, carried the State, C. C. Washburn, the Republican candidate, being beaten by about 12,000 majority. They have secured, also, a majority of the legislature. In Minnesota, the Democrats supported the farmers' candidates, and in the contest for the governorship succeeded in reducing the Republican majority. In Illinois, the elections were of slight importance, but were carried generally by the farmers. In Kansas, on a joint ballot, the Grangers and Democrats are said to have a majority in the legislature. The general result may be said to be a triumph for the farmers, and we hope, now that they have come into power in so many States, they will explain what they mean to do with it. There is a very strong resemblance between the rise of this party and that of the Prohibitionists. There are a number of States which the Prohibitionists carry regularly every other year, but, owing to practical difficulties, their success has had just that amount of effect on intemperance which we must say we expect the farmers' successes to have on the extortions of the railroad men, the iniquitous exactions of the pork men, and the infamous tyranny of the dealers in mowing and reaping machines.

The large part played by women in our system of public instruction has hitherto borne but scanty fruit, and only here and there are they beginning by courtesy to be appointed on school-committees and as local superintendents. In Illinois, however, the law has now come gallantly to their rescue, and last July an act went into force declaring "any woman, married or single, of the age of twenty-one years and upwards, and possessing the qualifications prescribed for men," eligible to any office under the school laws of the State. We learn from the Chicago *Tribune* that "at the recent election there were thirty-four ladies running in thirty counties of this State for the office of county superintendent of schools. Of these, eleven were successful—in several cases over candidates of the same sex; in one case, over candidates of both sexes." Eleven married ladies were among the contestants, and five were elected—a proportion due, we dare say, to the good sense of the voters, rather than to the fact that they had husbands to canvass for them. The *Tribune* reminds its readers that this is the second time that Illinois has enlarged woman's sphere of usefulness—the legislature having last year admitted her to the bar and to all other professions and callings except the military. Doubtless it will never have cause to regret either of these innovations, but it is more than ever incumbent on the State to provide the best education for women. The progress in this direction in England is marked by the steady increase of those who desire to avail themselves of the facilities offered at Cambridge. According to the *Athenæum*, the entries for the lectures for women already amount to 180, and the entries for the classes conducted by means of correspondence to 170.

On the first day of the last session of Congress Mr. Sumner offered a bill ordering the removal from the Army Register, and the regimental flags of the regular army, all names of battles which occurred in the late war, "in order that the memory of past internal strife might be obliterated." This proposal, which was looked upon as a renewal of Mr. Sumner's "reconciliative" efforts during the Greeley canvass, was received by the Administration senators "with smiles —not of approval." To do Mr. Sumner justice, perhaps the bill, timid as it was, deserved about that amount of respect; and to do justice to the Administration senators, it is probable that had they foreseen the revelations of the next few months, they might have received the bill with rather less derision. A wonderful tempest in a teapot the bill raised in Massachusetts when the legislature, under the lead of some very cock-a-hoop young Republican representatives, friends of Butler, drove the more timid members—overawed by the November majorities—into passing resolutions censuring their senator. The Springfield *Republican* has recently busied itself in sending to every senator-elect and representative-elect in Western Massachusetts an enquiry whether he would oppose or support a rescinding resolution. Gratifying replies announce that most of these gentlemen will "go for the repeal," or are "unqualifiedly in favor of expunging." The good sense of Mr. Sumner's bill apart, we suppose there would be no appreciable disappointment should the legislature take the action indicated. Nor do we suppose Mr. Sumner would greatly suffer if it should not.

Readers of the newspapers have often seen mysterious allusions to the oppressions of the poor farmers by "Town-site Rings." The Grange correspondent of the *Tribune* explains the nature of these rings this week. The land-grant railroads, it seems, receiving as they do alternate sections from the United States, have been obliged to offer inducements to settlers in order to prevent their buying the cheaper Government sections first. They have therefore got their own sections exempted from State taxation; besides this, they have corruptly placed their stations on their own land instead of that of the United States. This of course has had the effect of making the lands sold by the Town-site Ring more attractive to farmers than any other. By this means quantities of land in the West along the lines of railroads have been exempted for years from taxation, and the non-taxpaying farmers have been very lavish of the town and county money in consequence; for instance, in one of the towns on the Atchison, Topeka, and Santa Fé Road, a county court-house worth $200,000 and a very expensive bridge are being built, and other extravagant public improvements are going on. Now, this town is situated on a railroad section, and half the county is railroad land. Town-lots and farms are sold by the railroad company on eleven years' credit. The title does not pass for eleven years, and therefore the State cannot tax for eleven years. The settlers on these lands are therefore very glad to vote an issue of county bonds for public improvements maturing in ten years, and this they have done. The injustice practised here seems to be the oppression of one part of the settlers by another; but the Grangers say that it is all the work of the grinding monopolists.

This correspondent has also given a sort of résumé of all his letters on the subject of the Grange, in which he again makes the futile assertion that the Granges have nothing to do with politics. As we have repeatedly said, this is a very silly disclaimer, for the same men are Grangers and members of the farmers' associations which nominate candidates, control caucuses, and intimidate judges, and make all the outcry about "watered stock." He gives the following account of the remedies now proposed for the existing difficulties:

"The remedy proposed is different in almost every State. Some propose a pro-rata law; some desire a fixed rate of maximum tariffs for freight and passengers; some desire that the question shall be regulated by the State, and some by the United States. In some States the present contest is over the power of the legislature to control the railroads; in others, the power is conceded either in the charters of the companies or the constitutions of the States, and then the question is, *how* shall the power be exercised? Some hold that the right of eminent domain exercised by a State in condemning private property for the use of railroads is a right pertaining only to the State in its sovereign capacity, and one of which it cannot in any way divest itself."

In other words, the farmers in each State want something entirely different from what is wanted in every other.

The text of the Comte de Chambord's letter to M. Chesnelong has been published, and fully explains the collapse of the Legitimist movement. He expresses his surprise that conditions should be expected of him by his friends in the Assembly. The Comte de Paris asked for none; President MacMahon was not asked for any when he took office; Henry IV. would never have made any; and so on. On the contrary, he thinks the work before him, if he ascends the throne, is so serious that he will need all the authority that divine right can give him to accomplish it. He has, he says, to reorganize society on a sure basis; to secure the reign of law; to revive prosperity; to contract durable alliances abroad; and use force, if necessary, for the preservation of order; and how could he do all this if he was trammelled by pledges? He declares, moreover, that he is "the only one capable of bringing the ship [of state] into the harbor, because he has the mission and authority to do it." As there is no reason to doubt the Count's honesty, the letter makes it very clear that M. Chesnelong, who is a busybody of the "Colorado Jewett" type, grossly deceived the public as to the nature of the communications made to him by the candidate; and that, in fact, the majority in the Assembly has been the victim of a somewhat ridiculous mystification. The collapse also leaves the Orleans family in an awkward position, as they, by the fusion, abandoned the position of adherents to constitutionalism, which they had previously held, and now share in the disaster which has overtaken divine right.

There is nothing settled at this writing as to the prolongation of MacMahon's powers. The compromise proposed in the Committee on Prolongation was five years, but MacMahon himself has sent in a message to the Assembly asking for seven years, and expresses his desire to have the term begin before the Assembly votes the constitutional bills. He says that he will use any powers entrusted to him in the Conservative interest. The Committee, it is reported, is willing to concede the seven years, but nothing more. What the Marshal means by using his powers in the Conservative interest is indicated by his refusal to receive deputations which had come to Paris from the provinces to protest against the re-establishment of the monarchy, by his hostility to the Radical press, and, indeed, to all public demonstrations of an exciting political kind. He appears to regard the Assembly, in short, as the sovereign power, and to regard all attempts to influence it by agitation as seditious and deserving of repression, which is, perhaps, as near Liberalism as any French soldier of distinction has ever got, and which does not differ sensibly from the position General Cavaignac held in 1848-9, though he was by conviction a Republican, which MacMahon is far from being. The Bonapartists are still a little undecided as to what their course should be, but have resolved, in a little council held by the leaders in Paris, that they will insist on the decision of the question of the form of government by a plébiscite. But then this is not what the rogues said in 1851. Then they fixed the form of government themselves, and took the plébiscite afterwards, which is indeed what all parties do in France when they get the opportunity.

The only piece of news of any importance from Germany is that Prince Bismarck has been reinstated at the head of the Prussian Cabinet with flying colors, General Von Roon retiring. Von Roon, though a valuable military man, has but moderate sympathy with Bismarck's progressive policy, and especially, it is said, with the Ultramontane features of it, and as long as he remained in the Cabinet even the Presidency was less than Bismarck required to make his influence all he desired it to be. This fresh proof of the hearty support of the Emperor will give an increased impetus to the onslaught on the Ultramontane bishops, and destroy the hope which they secretly cherished, and of which the Pope's letter was an insolent expression, that his persistence might be broken down.

THE "VIRGINIUS."

THE summary execution of the large number of persons captured on board the *Virginius*, a few of whom were actually or nominally American citizens—an execution following a trial which at most was such as is used for military offenders of the worst sort in the hurry of operations in the face of an enemy, and which seems to have been conducted without even the show of decorum that accompanies the ordinary drum-head court-martial—has naturally awakened a feeling of horror throughout the country; and doubtless Europe will send back an immediate echo to our expressions of indignation. We would not in the least restrain this outburst of civilized wrath against Spanish ferocity and barbarism. If any of the persons taken on the steamer and shot to death in this manner were *bona-fide* American citizens, to whom the nation owed protection, even though they had committed crimes against Spain capital by its municipal law, an outrage has certainly been done to the United States from the *manner* of the trial and punishment—an outrage which can only be atoned for by an ample apology and by some severe personal penalty inflicted upon the local officials who thus violated at once the rights of humanity and of a friendly nation. From this position there can be no dissent; but it will hardly satisfy those who see in the whole transaction a violation of international law far more grave than the military execution of the prisoners. It is said that the capture of the *Virginius* was without color of authority, and that, as all the subsequent proceedings were tainted with this original illegality, an offence has been done to the United States which cannot be wiped out by any apology. This view seems to be maintained by many influential newspapers of both political parties; and it is evident that a pressure has been and will be brought to bear upon the Government, urging it to immediate and violent action against Spain, perhaps even to the extremity of war. As the national honor is involved in any aspect of the case, and as the theoretical and practical rules which control the intercourse of nations are matters of much public interest, we propose to examine the questions at issue as carefully as the limits of a single article will permit.

In the first place, we will state the facts which have thus far been established beyond a doubt, because the legal aspects of the case—legal, we mean, in the sense of international law—are intimately bound up with and depend upon these facts. For several years past, a state of insurrection has existed in portions of Cuba. While this insurrection has assumed such a character and such proportions that the Spanish Government has confessedly been unable to repress it by the ordinary methods of civil procedure and the civil tribunals, and has, therefore, resorted to the use of military force, that Government has never recognized the contest as being in any sense a war—not even a civil war; it has always alleged that its military force was merely in aid of the civil arm. In other words, it has acted upon exactly the same theory as that adopted by the United States Government in its first proclamations at the outbreak of our own rebellion. This position of Spain has been assented to and treated as valid by the United States and by other countries. The facts fully sustain this theory. The insurgents are not belligerents; they have no seaports, no means of directly and officially communicating with the world, no organized civil administration that is worthy to be called even a *de facto* government. The contrast between them and the Confederate States at the very inception of our rebellion is striking and complete. As the Cuban insurgents have no seaports, and, therefore, no territorial base of their own from which a navy can operate, and, as they possess no quasi-national flag which other countries recognize as even a belligerent flag, and as they cannot therefore fit out any vessels, warlike or commercial, naval or privateering, under their own colors, they are forced to use the flag of some other power (which for purpose of brevity we may call a neutral) in order to cover their hostile expeditions upon the ocean. Such a use must of necessity be a fraud upon the neutral as well as upon other nations, for the hostile naval expeditions are and must be disguised under a pretended show of commercial adventure. For obvious reasons, the United States flag is the one whose aid has thus far been generally invoked. It is notorious that a colony or society of Cuban insurgents has long been stationed in New York and in other seaboard cities, which has been engaged in fitting out and sending hostile armed naval expeditions under the guise of lawful mercantile voyages. The very newspapers which denounce the acts of the Spanish authorities as an outrage upon the United States because an American registered ship sailing under the American flag has been seized, state without an attempt at equivocation or concealment that this vessel was entirely under the control of the insurgents who make New York their base of operations, that the object of its voyage was military aid to their confederate insurgents in Cuba, and that the pretence of a trading voyage even in contraband was without a color of truth. The *Virginius* was an American-built steamer originally engaged in ordinary commerce. About two years ago she was bought by the Cuban insurgents who are stationed in this country, although doubtless the title was taken in the name of some American citizen. She once had, of course, an American register, and we assume that this register has never been changed, no matter who her real owners may have been and are. Since her purchase she has been used to convey warlike supplies, arms, material, and probably men, to the insurgents upon the island, but where she obtained her cargoes it is not now necessary to enquire. On the last voyage she had on board, besides a cargo of war material, a large body of Cubans who beyond a doubt were intending to join the forces with which they sympathized. She took on this cargo at and sailed from Kingston under the United States flag. Her destination was some concealed and favorable point on the coast of Cuba, where she was to unload the arms and ammunition and discharge the recruits. Nearing this coast she was seen by a Spanish gunboat, and immediately turned her course towards the island of Jamaica. The Spanish man-of-war pursued, overtook, and captured her. This capture was either on the high seas or within the territorial waters of Jamaica. There is some conflict of evidence as to the exact place of the seizure; but it is enough to say that the rights of the United States as against Spain do not at all depend upon the decision of this particular question. If the act itself was a wrong done by Spain to this country, it was equally and for the same reasons a wrong whether done on the high seas or within British waters. In the latter case Great Britain might be interested; but her interest either as against Spain or ourselves could not affect the relations of the United States to Spain growing out of the capture.

This outline of facts is sufficient for our purpose, and nothing has been stated in a positive manner which depends upon doubtful or conflicting evidence. The point which we emphasize, and in respect of which we challenge contradiction, is this: the *Virginius* was not a *bona-fide* American vessel, really owned by American citizens, chartered and controlled by traders, and engaged in a commercial adventure in articles contraband of war—a species of adventure which, while it renders the vessel and cargo liable under certain circumstances to be seized and confiscated by the injured belligerent, is not in any true sense a violation of international law. Although nominally American, she was in fact owned and was entirely controlled by persons who were either themselves Cuban insurgents, or who were agents of such insurgents acting in their behalf, and her voyage was for the purpose of carrying to these insurgents arms and other material owned by them, and transporting to them recruits for their warlike force. In other words, the element of trade, of buying contraband and shipping it in a neutral bottom, with a design of selling it to one of the hostile parties, was utterly wanting.

What are the doctrines of the international law which apply to these facts? Has Spain by this capture violated its duty to a friendly power, and inflicted an outrage upon the United States which follows and affects all the subsequent proceedings, even the trial and punishment of the Spanish subjects who were made prisoners? Some of the newspapers, and among others the *Tribune*,

have found a remarkable solution of this difficulty in the simple fact that the Cuban insurgents have not been recognized as belligerents. Conceding that, if such recognition had been made, the capture would have been lawful, these expounders of the international law assert that in the absence of the recognition any seizure upon the high seas is prohibited. According to them, as a state of war does not exist between Spain and its rebellious subjects, all that the former can do is to guard its territorial waters around the island of Cuba, and seize any warlike vessel of the rebels which is found within the limits of such waters. If this be true, the Cuban insurgents may fit out armed vessels at discretion, which may hover off the shores of the island, awaiting their opportunity to enter and land; and as long as they do not cross a line drawn at the distance of a marine league from the coast, the Spanish cruisers can only look at them, but cannot molest them. A rule of law which necessarily leads to a result so absurd bears on its face the evident marks of inaccuracy. In fact, it is difficult to conceive of a greater confusion of subjects and doctrines than is found in the position we have thus stated. It is true that neutral vessels engaged in commerce cannot be taken on the high seas on the ground that they are carrying contraband, or are attempting to break a blockade, unless the hostilities between the combatants amount to war, or, in other words, unless these combatants are belligerents. If a rebellion arises of such magnitude that some resort to arms is necessary, but the supreme government insists that the force and resistance do not constitute war, the control of that government over the foreign commerce which comes to its ports must be exercised within the ports themselves, or at most within the territorial waters which surround the coast. For this reason a blockade, if it be enforced on the high seas and be not confined to the territorial waters, *ipso facto* admits belligerency. While this doctrine is sustained by all modern jurists of authority, it relates solely to *neutral commerce*, to commercial voyages and adventures of neutral owners in neutral bottoms with one of the hostile parties, and particularly with that one which has not as yet assumed such an appearance of nationality as to entitle it to belligerent rights. The doctrine has no relation with, no possible application to, vessels actually owned by that hostile party, and engaged, not in any legitimate commerce, but in transporting arms, ammunition, and recruits over the ocean to the scene of the military struggle. The rule exists solely in the interests of trade, and of trade carried on by neutral merchants. If such merchants see fit to use their vessels in carrying contraband to the rebels, they run the risk of forfeiting the ship and cargo if caught within the territory—that is, within the national jurisdiction—of the mother-country which is putting down the insurrection; but they do not run the risk of forfeiting their ships and cargoes by capture on the high seas, unless the mother-country is willing to treat the contest as a war. In other words, when a government chooses to repress an insurrection by means of its municipal law alone, its field of operations, so far as neutrals—that is, the rest of the world—are concerned, must be confined to its own territorial jurisdiction. But it does not thence follow that its field of operations, so far as the rebels are concerned, must be confined within the same limits. There is no such restriction upon the powers of a nation towards its own insurgent subjects. If it meets those subjects on the high seas in a vessel belonging to them, engaged in warlike operations on their behalf, it may capture such vessel and its subjects on board her. The high seas belong to it as much as to any other nation; its jurisdiction over its own subjects extends to the high seas, provided they are there found upon its or their vessels; in fact, so far as the question of jurisdiction is involved, the vessels of its insurgent subjects are its vessels, for, according to no law recognized either by itself or by other peoples, has the bond of allegiance between all its subjects and itself been broken. It is plain, then, that the position we are examining is the result of an utter confusion of ideas, of a misapplication of rules relating to one state of facts and one species of persons to an entirely different state of facts and kind of persons.

We therefore reach the following proposition: While the Spanish Government cannot in the present aspect of the insurrection seize a *bona-fide* American vessel engaged in actual commerce upon the high seas or anywhere, except in Spanish territorial waters, even though the object of the voyage is to carry contraband to the rebellious combatants in Cuba, yet it may beyond question capture on the high seas a vessel which confessedly belongs to these insurgents, and which is engaged in carrying arms, ammunition, or recruits to them, or in rendering them any military service. If this be so, it is very plain that these insurgents, while actually owning, controlling, and using a vessel in this manner, might give to her the appearance of a neutral ship sailing under a neutral flag, and yet the appearance be so false, and the act so fraudulent, that no question could arise but that the power and jurisdiction of the mother government over it would remain as complete as though the ownership and control were avowedly in the insurgent body. Indeed, such a subterfuge would in all cases be absolutely necessary. Not possessing a *de-facto* government, nor a flag recognized in any manner by other nations, the insurgents could never use a vessel in their own name and under their own colors. A ship so described in its papers, and flying an unknown flag, could not enter and depart from the ports of other countries. The only method, therefore, open to the community we are describing is to conceal its own ownership and control under the thin disguise of a neutral ownership and flag. If the mere fact of such disguise, without enquiry into the true ownership and control, ousts the mother government of jurisdiction over the vessel on the high seas, then we reach this astounding result, that insurgents not recognized, and not entitled to be recognized, as belligerents may cover the ocean with vessels armed, or carrying arms and recruits, fraudulently sailing under a neutral flag, and the mother government be absolutely powerless to interfere with them. If this be so, then a concession of belligerent rights, instead of being a boon eagerly to be sought for by a rebellious community, is an evil to be avoided and prevented at all hazards. This is truly a *reductio ad absurdum*.

THE REASONS FOR KEEPING COOL ABOUT IT.

There does not appear to be any reason to doubt that the Government will deal with the questions raised by the capture of the *Virginius* and the butchery of the crew and passengers, with all the requisite coolness and prudence, as well as with all the requisite energy. In other words, it does not appear that it stands in need of any guidance or pressure from public opinion. But, then, it will certainly be an immense assistance to it in any line of action on which it may determine to have from the public a fair amount of intelligent and thoughtful support. There are some influences at work, as in all similar cases, which are calculated to prevent such support being given. One is, of course, the constant tendency of the newspapers to treat questions of this character in a sensational way under any circumstances. Many editors consider it a sort of patriotic duty to lose their heads whenever they are called on to discuss any matter which appears to involve the honor of the national flag, and public men are apt to conceive it to be the part of personal prudence in such cases to take the extreme anti-foreign view, whatever may be the state of the facts or the bearing of the law. The people, in this matter, are apt to be left, at very trying crises, without any advice or information from the very persons whose special duty it is to supply it, on points, too, on which it is almost impossible for the average man, with his business to attend to, to make up his mind in a rational way. Just now, the ordinary risks of the situation are somewhat aggravated by the fact that the excitement about the panic is rapidly subsiding, and the winter prospect would, without the Cuban trouble, be a very dull one for the reporters. A foreign war, too, would be an enormous relief to a great many Congressmen in face of the probability that they will have to pass the next six months in dull financial discussions, and

to the large band of speculators who are eager for some good excuse for inflating the currency. There are a great many heads "inside politics" which are much better filled with ideas about "Morro Castle," and the value of Cuba as a naval station, than about foreign exchange or the best mode of resumption. There are a great many financiers, too, who, while they are half ashamed to ask for expansion in order to help them out of their own difficulties, would have no hesitation in asking for it to help to "vindicate the national honor."

In acting against the Spaniards, we owe it to ourselves and to international usage to endeavor to put ourselves, to a reasonable degree, in their place. We ought not to forget, in measuring their guilt, that the men whom they have massacred are the chiefs and promoters of an insurrection which has now lasted for several years; and which, however noble or justifiable we may think it, they look on as an attempt to dismember and humiliate their country; and which—and this is the most important point of all—has, during that whole period, had its base and headquarters in this city. More Cuban generals, and colonels, and commissaries could, we venture to say, for a long while past have been seen in Broadway, on fine days, than in the island of Cuba, and the great bulk of the supplies of arms and munitions which the insurgents have received have come from this country, owing to the connivance or negligence of United States officers at various ports. What most contributed to the capture of the *Virginius* was the notoriety with which the preparations for her voyage were made, and this notoriety was the direct result of long-enjoyed impunity. Everybody in Cuba was on the lookout for her, and she was known to contain a fine batch of insurrectionary leaders; the temptation to massacre them, and thus end the struggle, was therefore overpowering to the savages into whose hands they fell. In fact, their readiness to capture the ship at all hazards—she being an old offender—will be understood by those who can imagine the feelings with which the trip of a steamer from Liverpool to Charleston with a lot of Confederate leaders on board would have been regarded in 1862. The officer who threw his law-books overboard and seized her, anywhere and anyhow, would hardly have fared worse, in the public estimation, than Captain Wilkes after he took Mason and Slidell out of the mail steamer. Of course no butchery or cruelty would have been thought of; and this leads us to another plea in behalf of the Santiago cut-throats which is perhaps not powerful, but which is to be weighed.

A year ago or more, a number of gentlemen in Madrid, after the experiment of getting somebody to reign in Spain as a king had been tried and had thoroughly failed, agreed that they would hereafter call Spain "a republic." There was no harm in this that we could see. In fact, it was the only thing to be done. But there was also no prospect of immediate good in it, as we pointed out at the time. It left Spain just as she was, neither better nor worse; the defects of character, and manners, and opinions which had made her for a century and a half a barbarous and declining nation, were still as deep as ever. The causes which had made the monarchy a failure were still at work, and were likely to make the republic a failure. Nevertheless, a considerable number of persons here worked themselves into a state of enthusiasm over the change, and tried to persuade people that a process of regeneration had suddenly begun in Spain, and that all that the rest of the world had to do was to look on and wonder or admire. Within a few weeks, the republic broke down and was postponed. The army went to pieces; the navy revolted; the provinces began to declare themselves independent; and ministers at Madrid came and went like a showman's diorama. A dictator was accordingly appointed, and even he declared he could not rule if the legislature did not adjourn. He has at this moment three civil wars on his hands, which are waged with that feeble indecisiveness which characterizes all Spanish military operations, and he is forced to confess that in the greatest remaining colony of the nation neither the army nor the navy obeys his orders. Our demand for satisfaction for a gross outrage, indeed, seems likely to result in his overthrow, if he complies.

Now, what has this to do with our attitude in this Cuban matter? Much. The Spaniards in Cuba, on whose heads we are now calling for vengeance, are men of precisely the same kind as the Spanish in Spain whom we are embracing as brother republicans. They are not one whit more lawless or more cruel. The Santiago and Havana volunteers have the passions of their countrymen at home, and are doing what their countrymen wish them to do, and in the way they wish them to do it, and what any Spaniard brought out to Cuba would do in their place. The attempt to distinguish between the two is either childish or ignorant. The Cuban civil war has all the characteristics of all the Spanish civil wars during the last century—that is, it is languid, desultory, ferocious, and indecisive. Civil and religious tyranny have so debauched the Spanish people that though individually brave they have lost the capacity for combined and protracted effort even in military enterprises, which is one of the highest marks of civilization. It is one hundred and fifty years since a Spanish army counted for anything among military men. Fifty thousand Frenchmen or Germans could any day during that time have marched to Madrid, and would be sure to dissolve any large force that attempted to bar their passage. But then they would find themselves incessantly harassed, as in all barbarous countries, by guerillas. The country people and the soldiers would "bushwhack" them, as the Circassians or Greeks or Kabyles would do. There would be plenty of fighting, but, on the Spanish side, it would be by individuals and small bands from behind rocks. There would be found neither the capacity for command nor the capacity for obedience, nor the mutual confidence, nor the stalwart courage, out of which great armies are made, and by which great fields are won and national self-respect preserved and perpetuated. There would be found the remorseless cruelty which has characterized the operations in Cuba. The shooting or torture of prisoners is a process with which every Spanish officer is familiar. It took place all through the war of independence against the French, and all through the Carlist war of 1837; and it takes place in the two civil wars now waging on Spanish soil. All these wars, too, were and are characterized by the languor which marks the Cuban war. The first Carlist war lasted six years, though waged against the whole Spanish army, aided by a "British Legion." There appears to be no good reason why the present operations against Cartagena, both by sea and land, should not last indefinitely. The Spaniards of the New World, too, appear to have both the traditionary virtues and vices of the mother country. They are perpetually at war, though their war is never on a great scale, and a victory is invariably, or all but invariably, followed by wholesale executions. The Cuban Creoles, long-suffering patriots though they be, are just as cruel as the men they war against. There has been no atrocity committed in the present struggle by the Spaniards which they have not matched. Why should they be any better than the Spaniards? We wish some of their rhetorical friends in this country would, after having bathed their own heads, ask themselves this question, and answer it: What reason have we for supposing that the descendants of Spaniards, bred to a tropical climate, under the teaching of tropical Catholicism, in contact with negro slavery, and under a military government, have become the sober, chaste, self-restrained, brave, and humane patriots who are usually held up for popular admiration at indignation meetings? It ought to be asked just now with more than usual solemnity, and answered with a more than the usual sense of responsibility, because when we talk of annexing Cuba, as some of our orators do most glibly, we mean the admission to a share in this government of a motley million and a half of Spaniards, Cubans, and negroes, to whom our religion, manners, political traditions and habits, and modes of thought are, to tell the honest truth, about as familiar as they are to the King of Dahomey. If ever there was a step which the nation needed to take with a cool head, it is the step of meddling in this Cuban matter.

THE BANKS AND THE FINANCIAL CRISIS.

WE can hardly suggest more cheerful reading to those who take gloomy views of the existing financial situation, than the report of the Committee of the Clearing-House Association on the reforms required in the practical operations of banks with each other and with the public, and to increase the security of their business. We do not mean by this that the report puts the actual condition of trade and commerce at this moment in any better light, or opens up any new way out of our present difficulties. But it shows beyond question that at a time when the air is filled with delusive schemes for financial reform, the leading financial institutions of the country are in the hands of men who keep their heads cool, thoroughly understand their business, and are prepared to conduct it under the most trying circumstances with unshaken skill and courage. Nothing could well be more creditable than the way in which the banks of this city met the storm which is passing away; but how well they met it, and how serious the consequences would have been if they had failed to unite, we did not know until the present report appeared. It asserts, and asserts truly, that the banks of New York have gradually but inevitably become the last resort in this country, as the Bank of England is in Great Britain, in times of financial extremity—that is to say, they have in their possession, or under their control, a very large proportion of the floating capital of the country, and, more than this, are the ultimate holders of the reserves of nearly all the country banks. If they give way, therefore, in a panic, ruin reigns; that they did not give way in this last panic, was only prevented by the thorough comprehension of the situation shown by the stronger banks, whose managers are the authors of the report before us. Nothing could well have been more unfortunate than the situation in which the failure of Jay Cooke & Co. found them. "When the panic commenced," says the report, "the sixty banks composing the New York Clearing-House were indebted for about two hundred millions of deposits. Of this amount, three institutions owed about fifty, and, including these, twelve banks owed about one hundred millions"; the other forty-eight owed the remaining hundred millions. Consequently, the twelve must inevitably have gone to pieces if the others had not promptly agreed to make common cause with them, and to see them safely through the crisis, which they did. Had these twelve failed, the consternation would have been so great that probably no financial establishment, and but few commercial houses, would have lived through the crash. There is some talk in the report about "fraternal sympathy" as one of the motives which induced the strong banks to help the weak; but this might better have been spared, as it has naturally given occasion to hostile critics to say that this is all pretence, and that the real reason of the alliance was the fear of the strong banks that their own funds, lent on commercial paper, would be lost if they allowed their erring brethren to be overthrown. As a rule, all emotional banking is bad banking. The banker's highest virtue, after honesty, is prudence; he has no more to do with kindness or any other passion than with art or literature. Therefore, if the authors of the report had said that the banks united for purposes of self-preservation, they would have uttered the highest boast in which it is permitted to a banker to indulge.

There are, too, passages containing definitions of the nature of banking, and of the relations of the banks to the community, and pronouncing condemnation on "competition," which most thoughtful men will consider too sweeping or too hasty. The following, for instance, is a statement which few will be disposed to accept without a great deal of qualification:

> "Bank officers have no right to be sharp personal competitors for public patronage, nor merely laborers for dividends on behalf of a limited constituency. They are in a most important sense trustees for the whole community and public administrators of great interests, which forbid the least departure from principles which long experience has sanctified."

This is all in a measure true, but only in a measure. It is for the interest of the public that banks should "compete for public patronage," and also that they should "labor for dividends"; so that the question turns on what is meant by competition. If you say they should compete in the display of bankers' virtues—foremost among which is prudence—you say everything that need be said, but nothing very new.

Now, how did it happen that these twelve banks owed so much, and that $58,916,000 was withdrawn from them in a few days during the panic, while the other forty-eight only lost $30,142,000? Simply because the twelve invited the deposits from the country banks by offering four per cent. interest. They were thus burdened during the summer months with enormous sums, which they were compelled to lend again on stocks and bonds; and when confidence was lost in Wall Street, and the depositors began to call in their money, there would have been nothing for it but to break, if the banks which had avoided the pernicious practice had not, do not let us say generously or kindly, but *wisely* come to their aid, and assisted in bearing the burdens which imprudence, not to say recklessness, had imposed.

We say recklessness, because the dangers of paying interest on deposits were fully revealed in 1857 by the panic of that year. Another Committee of the Clearing-House Association then condemned it in the strongest terms, and forty-two banks agreed, in March, 1858, not to receive an account and allow interest on it. The war, and the revolution which it created in the banking system of the State, and the appearance on the scene of many new banks and new men, caused this salutary pledge to be forgotten; the old mode of getting business was resorted to on a greater scale than ever, and with results still more serious—for, when the last panic broke out, the New York banks were so laden with country deposits that their own and the reserves of all the national banks put together were reduced to about ten per cent. of their liabilities; that is to say, the subdivision of the reserve is carried to such a point that it in reality dwindles down at last in the financial centre, the seat of "the last resort," to less than half the sum required by law or prescribed by prudence.

Reckless taking of deposits, with accompanying liability for interest, naturally tends to reckless lending. The depositary who pays four per cent. must make more than that or perish, and in dull times he cannot be very particular about security. The banks dealing with stock-brokers, therefore, got into the habit of certifying checks whether the drawer had funds or not, and leaving it to his honor to "cover" them before the close of the day. To such an extent was this practice carried that the report says that some of the banks have certified daily to twice or three times, and in one or two cases to four or five times, the amount of their capital stock "through long periods." In other words, while the directors were debating in the parlor the standing of merchants applying for loans of tens of thousands of dollars, the tellers were, on their own responsibility, without any consultation at all, pledging the credit of the banks to brokers for hundreds of thousands of dollars without any security. We ask all revilers of Wall Street, however, to take notice that the confidence they so recklessly bestowed was, even in the whirlwind of the panic, only once betrayed. Of the millions on millions thus borrowed, through long periods of time, on a simple understanding, nothing was lost or endangered through any man's falsehood or shortcoming, except in one instance. We know of no body of men in the country which can present such a splendid proof of its integrity, and the Board of Brokers might challenge any church, club, or society to subject its members to such a test, and have no fear of the results. This by no means justifies the practice of certifying checks, but it explains in part how it grew up. The Clearing-House report recommends its utter prohibition henceforward; but one of the curious features in this portion of the document is the slight notice it takes of the legal prohibition of the practice. Indeed, one of the minor recommendations uttered in support of the proposed prohibition is "that it will conform to and confirm the law on this subject."

The portion of the report which will most interest the public, however, is that which regards the relations of the banks to the money market. The doctrine, as we have said, is boldly, and we

think justifiably, laid down that the New York banks have come to occupy towards the money market of this country very much the position of the Bank of England towards that of Great Britain; that is to say, the unemployed capital of the country naturally flows to this city as the great financial centre, and it will continue to flow here whether interest is paid on deposits or not. It is the reserve of the New York banks which financiers all over the country watch when they wish to know the "state of the moneyed mind" or forecast the commercial future. "Ease" in New York means ease everywhere, and "stringency" in New York means stringency everywhere; and if the New York banks fail, the other banks follow their example. Now, the Bank of England is armed with powers corresponding to its responsibilities. Inasmuch as the business of the whole country is in a measure dependent on its mode of conducting *its* business, it is allowed, as far as the banking department is concerned, to conduct business as it pleases; that is to say, being a dealer in money, it is left like a dealer in any other commodity to its own judgment and discretion. Accordingly, it raises or lowers the rate of interest as the times may seem to require. If there appears to be trouble ahead, from whatever cause, it hoists a danger-signal by a rise, and then prudent men go into port or take in sail. If one rise will not do, it makes another, and continues them until the community has got its head cool, and made everything snug. Our banks here begin to bear very much the same responsibilities, and have no such power. They are tied down to 7 per cent. by an absurd provision of the National Banking Law, so that no matter what dangers they may see in the future, they have no power to give warning to the country at large or enforce caution among financiers. Money, it is true, rises "on the street" far above the legal rate, far above any rate ever paid before by civilized man to his fellow in time of profound peace; but the quotations of it make no impression on the public mind. When people hear that money was one-sixteenth or one-eighth over the legal rate in New York yesterday, they think that it was only the "stock-gamblers" that were paying it to support their wicked speculations, and that "the legitimate business of the country" was going quietly on at the supposed scriptural rate of seven per cent. Now, if the New York banks could last winter have given open warning that trouble was ahead, and that "railroad men" and all other promoters of new enterprises must cut down their estimates, or, in other words, that the country was running ahead of its disposable capital and available credit, most assuredly the fall would have found us in a sounder condition than it did.

The report recognizes this fact, but in feeble and timid language, which reveals only too clearly the extent to which even the minds of the ablest business men of the community have been debauched by Government interference. The following passage is a curiosity in its way:

> "The Associated Banks of New York, the ultimate resource in financial emergencies, are deprived by usury laws of the power, which is so effectively used by the principal banks in Europe, of protecting or augmenting their resources by adjusting the rate of interest to the necessities of the occasion—a power which, if practicable, Congress might safely confer upon the Clearing-House Committee, in consultation with the Secretary of the Treasury, with great advantage to the country; as also the power of deciding when the time or the emergency has arisen in which the public interest requires a relaxation of the rigid legal requirement in respect to the reserve to be held by banks in New York city."

The notion that the Secretary of the Treasury, or, in other words, whatever country storekeeper or village lawyer the President may reward for his political services by giving him the charge of the public money, can help the leading bankers of the second commercial city in the world to decide when they ought to raise the rate of interest on their loans, is one which, better than anything which we have seen of late, illustrates the change which has come over the public mind since the war, regarding the relations of the Government to the nation. Which of these bank presidents would think of consulting Mr. Boutwell or Mr. Richardson about the rate of interest if these gentlemen lived at home in Groton or Lowell? and is there any subtle virtue in the title of Secretary of the Treasury which makes him a financial authority after he gets to Washington? That the Secretary should be consulted with regard to the relaxation of the legal limit of the reserve is reasonable enough as long as the Government guarantees the payment of the bank-bills. The Government here represents the nation, which may be called on to pay the bank-bills if the banks fail; and its representatives, therefore, whether wise or foolish, are entitled to their say as to the means provided by the banks for protecting their paper issues; but what has the nation to do with the rates at which Moses Taylor may think it prudent to lend money to John Smith, or at which John Smith may find it convenient to borrow, especially when its financial representatives are apt to be men who have no financial training or financial experience, and often make light of financial knowledge?

ENGLAND.

LONDON, November 1.

THE most important political event in our parish during the last fortnight has been the reappearance of Mr. Bright on the public stage at the Bingley Hall, Birmingham, before some 17,000 people, who gave him a welcome so enthusiastic and so affecting that, as he stood on the platform waiting for the roar of applause to subside, he trembled like a reed shaken in the wind. No doubt it was an anxious moment for all, and there were present persons from all parts of the country. It was known that he had undertaken to address his constituents in that enormous space with extreme reluctance and misgiving, and it was feared that the exertion might prove beyond his strength. In the delivery of his opening sentences, there were not wanting symptoms of nervous weakness, and in the closing peroration there was a tone of solemn and mournful emotion, and almost an accent of farewell. But the rest of the speech, if not equal to the grandest efforts of former years, showed no sign of enfeeblement or exhaustion. There was the old large, lofty, and yet homely utterance; the clear and vigorous manifestation of a mind with no dark corners or secret passages in its ample structure. No redundance of words, no prolixity, no digression, but a masterly conciseness, with occasional strokes of the easiest and happiest humor, not spiteful or malicious, but indulgent as a giant's strength. As an agitator, Mr. Bright's career is past; he speaks with the caution, the forbearance, and the moderation that become a veteran who shrinks from abusing the rights of victory. His principles are unchanged, and in all his aims and objects he remains the Radical whom the Tories once denounced as a dangerous demagogue; he is no fonder of hereditary legislators, of bishops, or of church establishments, than he was ten years ago; and his criticisms even upon the measures of the colleagues he has rejoined are as independent as when he sat on the back benches below the gangway. But he has returned to office purely out of personal devotedness to Mr. Gladstone; and it is to restore the confidence of the whole Liberal party in their leader, to bring back disaffected Nonconformists to their allegiance, and to rally the sympathies of the Radical electors, that he accepts the responsibility of power and advises patience. The truth is that Mr. Bright was always essentially conservative, though not in the strict party sense. There is not an atom of the cosmopolitan revolutionist in his nature; he is English to the core in all his thoughts and feelings, his ways and his works; and, whatever Tories may suppose, his was always a moderating and restraining influence. If he demanded that some rubbish should be cleared away, it was to save the building; and his destructiveness has consisted in broadening and deepening the bed of a stream to prevent the inundation of a torrent. There was a passage in his speech the other day which betrayed curiously enough an old infirmity—a certain laxity of recollection with regard to dates and details. He was expressing his cordial disagreement with those clauses of Mr. Forster's bill which have raised such an uproar of jealous alarm and anger among the Dissenters; and he excused himself from having been officially cognizant of a measure which was introduced into the House of Commons just after he was suddenly compelled by a dangerous attack to withdraw himself from public business altogether. Now, a correspondent of the *Times*, who signs "Amicus Veritatis," and who is probably an inmate of the Privy Council Office of Education, proves beyond all doubt that Mr. Bright must have seen the original memorandum of the bill and assisted at its preliminary discussion in the Cabinet councils in November and January, and that he had not left office or left London before the bill was actually drafted and on the table of the House of Commons; and moreover, that the clauses to which Mr. Bright now particularly objects were actually modifications in his sense of the original scheme. Evidently, Mr. Bright was not in a condition of health for many months before he resigned office to take active part in council, or to exert the discretionary influence for which "Amicus Veritatis" by a reference to dates holds him strictly

accountable. But this unfortunate lapse of memory and attention serves to indicate the defects which accompany the qualities of a minister whose influence in council was supposed out of doors to be paramount, while he was really nothing but a nominal adviser and administrator. When Mr. Bright was in office before, he scarcely ever made a speech out of Parliament without getting his colleagues into trouble by forgetting his share of the joint and several responsibility for ministerial legislation. This is undoubtedly a fault, due to long inexperience and independence, which disfigures in some degree his reputation and usefulness as a statesman, and makes his accession to the Cabinet appear, I dare say, to Mr. Forster like the celebrated *cadeau* of a white elephant. Making all allowance for the art of an orator who does not improve his efforts, I fear that Mr. Bright's melancholy peroration the other day was inspired by a very genuine consciousness of failing physical powers. I should rejoice to learn that he was stronger than he looks, and that his consciousness was a last illusion of a lingering malady. But his countenance bears the traces of a slow decline; there is a loss of elasticity and of animal spirits. His name alone is a tower of strength to the Cabinet; the weight of his counsels on one or two questions in which he is deeply interested may be felt in council, and he may speak once or twice with all his decisive authority in the House. More than this can hardly be expected of him hereafter, and more than this I hope he will not be persuaded to attempt.

The literary event of the last fortnight is the appearance of John Stuart Mill's 'Autobiography.' It is not for me to trespass upon your critical prerogatives. Nor need I insist on the profound and attracting interest of such a record of a mind at once so transparently simple and sincere, and so powerful and subtle, in its manifestations. Suffer me to note only one or two passing impressions of this curious introspective study of a life almost absorbingly intellectual, even in its emotions, and in all that belongs to action and events. My first surprise is that a child who learnt Greek in his fourth year, read Plato in his eighth, and mastered political economy in his twelfth, could escape total idiocy before twenty. Mill's brain must have been an instrument of marvellous strength and delicacy combined, as well-knit and compact as it was finely strung. The passage in which he describes the terrible depression into which he fell upon the threshold of his manhood, when all his knowledge and learning suddenly seemed vanity and emptiness, and his formulas and schemes of utilitarian beneficence to mankind mere barren and joyless tasks, is as pathetic as St. Augustine's confession of his need of loving and being loved, and far more interesting as a psychological experience. It explains much that follows after. Does it explain what comes before? I mean his utter and absolute silence about his mother. Never once does the mother appear in this life-story—not in the son's childhood, not in his boyhood, not in his manhood. Yet she lived until he grew to be a man, and brought up a family of younger children. What a strange comment upon the common theory that men of genius are their "mothers' sons." And though the father in this case, James Mill, may have been the parent as he was certainly the trainer of the logician, the economist, the philosopher, nearly the whole emotional side of Stuart Mill's nature and character must have come from his mother. Certainly, it did not come from the father, who sternly repressed all feeling as a folly, and all emotion as an unpardonable weakness. It may be said that this autobiography is the story of the career and operations of a single mind, not the "trivial grand record" of a family household. Doubtless, and notwithstanding all the beauty and the charm of the man's nature it depicts, this is the secret of a certain melancholy impression it leaves behind. The language of passionate adoration, or rather of religious worship, in which Mr. Mill speaks always of the lady with whom he lived for nearly a quarter of a century in the closest and most intimate friendship, and for a little more than seven subsequent years as a devoted husband, appears to me quite explicable without attributing to Mrs. Taylor any superhuman qualities, or accepting too literally the worshipper's account of his own idol. Rigorous asceticism during half a lifetime, an intense and overflowing sensibility and susceptibility to sympathy and emotion, violently suppressed; little acquaintance with the world of men, and none at all with the world of women—and then all at once the meeting with a clever, large-minded, strong-willed, enquiring, but not otherwise remarkable woman of the world, living in a sort of semi-detached condition as the wife of an estimable but not remarkable person; the electric sorcery of a woman's presence and conversation, doubled by the shock of a mutual attraction—all these circumstances and influences unite to make that exaltation which is usually the privilege of the religious. To me this illusion of a singularly pure heart appears a sort of Nemesis of faith. Mr. Mill was never a dogmatic unbeliever in creeds and doctrines which he had never been taught. But he had the tender and reverential yearnings which make men religious, and which religion satisfies; his whole heart went out to the one woman he had ever loved; he found in her that divination of his own thoughts, that true womanly insight, which he mistook for genius. He was dazzled by the reflection of his own rays, and when his wife unconsciously repeated what she had heard from his lips a few hours or days before, he fancied the adopted offspring was her own. His imagination, reacting on itself, mistook an echo for a voice: the echo was hers, the voice was his own.

This at least is my interpretation of his belief that his wife dictated the admirable chapter on the Future of the Working-classes in his 'Political Economy,' and that his 'Logic' was the only one of his works he could call his own. There is one other point in the 'Autobiography' on which I may be allowed to say a word. Mr. Mill seems to have considered his short career in Parliament as on the whole successful and satisfactory, but he hints a regret at having spoken too exclusively in the character of a Quixotic champion of pure reason and abstract right against the prevailing prejudices of the audience. The fact is he never caught the tone of the House; the country gentlemen and the capitalists could never understand him—they imagined him too clever by half, and hated him as respectable mediocrities are apt to hate original thinkers, who try to cut blocks with razors and talk over the heads of ordinary mortals. His influence in the House, especially among the younger men on both sides, was decidedly beneficial, and in the private life of the House he was liked and courted even by political adversaries. All Liberals and many Conservatives were proud to see him in Parliament; and his speeches, carefully prepared and written out beforehand for the reporters, were, despite the weakness of his presence and the shrill voice, delightful to hear as to read, not only for the closeness of the argument and the finish of the style, but for the uncompromising courage of their language and principles. Nevertheless, one could not but feel that, sitting in Parliament and always in his seat, Mr. Mill was losing hours that might have been spent in his study with more advantage to his generation and to posterity, and that while he was undoubtedly extending his influence over a wider range, it was perhaps losing in height and depth what it gained in breadth.

The death of Sir Henry Holland has removed from the best circles of English, and I might add of European and American, society the kindly face of a familiar and ever-welcome friend. Although he had reached the neighborhood of his eighty-sixth birthday, his departure on the final journey seems to those who knew him best premature and untimely. Within a week of his death he had passed through Paris, returning from his autumnal tour, and was observed among the spectators at Trianon at the trial of Marshal Bazaine—I can hardly say among the audience, for he had latterly become very deaf. He caught a cold on the journey from there to London, went to bed, and never rose from it again. It was a peaceful and natural end of a life of which not a single waking hour was wasted. A fashionable court physician, a traveller in all quarters of the globe, a curious and diligent investigator in science, a citizen of the world whose delightful manners and conversation made him equally at home in all countries and with all companies, Sir Henry Holland lived all his life, from a boyhood of brilliant promise to an extreme old age, as full of youthful spirit and unabated curiosity as of honor and respect, like an intelligent and instructed visitor from some other planet who had come to make himself thoroughly acquainted with all the possibilities of knowledge, of experience, of social existence, of pure enjoyment, of venerable activity in this world of cares.

Correspondence.

SOME PERTINENT REMARKS.

To the Editor of the Nation:

Sir: I hope the *Nation* of this week will do its best to stem whatever popular absurdities the ravings of the general press on the *Virginius* question may lead the public, and perhaps seduce the Government, to commit in the matter. Of course we have really very unreliable and inadequate information of what has been done at all. But in the light of the past, it seems to me that it behooves the American press to "shut up," or at least to be very modest, about the indignity suffered by the American flag, if the editors will recall the *first* attitude they took in the *Trent* affair. Words could hardly be found to express their ecstasy of approbation at Captain Wilkes's indignity to the British flag, and old Mr. Welles got trapped into a commendatory order. Now, when somebody has done a lesser indignity to the American flag, even if any, they forget their attitude of ten or twelve years ago, and howl on the other side like dervishes.

As to the "butchery," I think we had better know more about it. I have no sympathy with these filibustering, buccaneering, hostile expeditions, got up by "American citizens" of Irish birth, like "General" Ryan and his fellows, and rather incline to the belief that they deliberately took their

lives in their hands. The American flag is not designed as a cover for such iniquities as this. Had they reached shore with their "300" armed men and horses and artillery, they would have fallen to shooting people just as deserving as themselves, perhaps more so.

I thought we had set the world an example of the "peaceful arbitration" of international difficulties. Do the proceedings before such tribunals begin by insane howlings of the press and the getting out of iron-clads, etc., etc.?

Yours truly, A Disgusted American.

New York, November 17.

A NOTE FROM MR. WATTERSON.

To the Editor of the Nation:

Sir: Entertaining a shadowy notion that the public stands in no need of further advisement in the ethics of journalism, English or American, I venture to ask room enough in the *Nation* to correct one or two misapprehensions contained in a paragraph of your last issue. I did not deny the power of the London *Times*, or express surprise thereat, as Mr. Smalley unwittingly and rather paradoxically misled you to say. On the contrary, whilst believing that the influence of the *Times* is on the wane, I ascribe it, as Mr. Smalley does, to its representation of that typical, slow-moving, ox-headed provincialism which pervades the upper and middle classes of English society. One may respect the patriotic stolidity of this provincialism without being pleased by its manners or dazzled by its dulness. But I did not complain, as you say, of the lack of "spice" in the London *Times*. I merely declared that, as this morning's record of the world's yesterday, it is deficient, inferior as a newspaper to the press of New York, Chicago, St. Louis, and Cincinnati, and, in point of intellectual calibre, not superior to certain journals which might be picked out of the American cities named. Nor did I point to Mr. Boucicault as a "likely" editor of the London *Times*, which moves Mr. Smalley to believe establishes my incompetency to observe the character and working of English journalism. I was urging in the presence of a company of rural editors like myself that every age has its particular social influence—the drama, the essay, and the novel each having served its turn. I suggested that in our day the press is what the stage was in Shakespeare's time, and then, editor-like, seeking hurriedly for an illustration, I found Mr. Boucicault at my elbow, and remarked that a successful playwriter like him—a man gifted with a popular genius or facility—a man whose current and versatile talents had supplied one conspicuous public want—might have done still better with himself in journalism; might, indeed, have risen to be editor of the London *Times*—using the London *Times* as a figure or figure-head. This is the head and front of my rash garrulity; and because of it I am set down for a dolt who has no better conception of his calling than to fancy that the personalism and slang of our American frontier could be transplanted with advantage to the press of London, and who signalizes his absurdity by nominating an unsteady and eccentric Bohemian for manager of the most pompous humbug in the world. I believe you are wittily mistaken in saying that the comparative merits of the *Courier-Journal* and the London *Times* have been brought into discussion. When the matter reaches so serious a point, modesty may be expected on the scene to drop—as Mr. Swiveller says—"the curtain and a tear."

Henry Watterson.

Louisville, Nov. 10, 1873.

Notes.

A. D. F. RANDOLPH & CO. will publish shortly a volume of religious poems, by the author of 'Stepping Heavenward.'——Cassell, Petter & Galpin have issued an Illustrated Catalogue, full of large and handsome wood-cuts, which make it a very fit holiday present as a picture-book.——G. P. Putnam's Sons have published separately from their 'International Atlas' the maps of classical geography, in flexible covers, and have also issued in the same style, but smaller, an 'Atlas of Scripture Geography,' with questions accompanying each map.——A work which deserves mention both on account of its novelty and of the energy displayed in compiling it is Mr. F. Leypoldt's 'Trade List Annual'—a uniform collection under one cover of the trade lists of all American publishers, and of some houses which are to be called publishers only by a very liberal extension of that term. It is singular that any opposition should have been met with in such an enterprise, but we believe it required all Mr. Leypoldt's persistence to bring about the desired co-operation. Some attempt at classification has been made in the index, but the 'Annual' naturally falls very far short of an alphabetical finding list.

—The current number of *Harper's Weekly* contains a forcible caricature of the present condition of the "farmers' movement" by Mr. Thomas Nast. The scene is a Western farm, and at the rear is a railroad train in ruins, with the word "Panic" posted up in a conspicuous place; a "wildcat speculator," whose appearance is something that of an escaped or perhaps just rearrested convict, is gloomily looking with his back turned (and his back is the most corrupt-looking back we have ever had the pleasure of seeing) at the wreck; with his face to the spectator stands the granger, with the air of a man who knows himself to be the possessor of a fraudulent heart, and is at the same time filled with a burning desire for vengeance upon his former "pal" the speculator. The granger, with a very hang-dog slouching look, or rather glare, in the direction of the speculator, asks the latter to explain what all this means; while the speculator replies that the granger may find that out for himself. The caricature leaves one somewhat in doubt whether the caricaturist meant all that we may infer from it, but there is the cartoon itself, and until Mr. Nast states that he is a warm sympathizer with the efforts of the yeomen of the West to relieve themselves of the tyranny of the railroad extortionists, we shall be inclined to think the cartoon a very effective one—one of the best he has done. He has been lately so exclusively occupied in attracting the attention of the public to a supposed resemblance between the head of the proprietor of the *Herald*, Mr. James Gordon Bennett, and that of a jackass, that he has hardly had as much time as those who like his caricatures could wish for the higher walks of the art.

—An unwillingness to find any fault with Mr. Longfellow on the occasion of his presenting the public with his 'Aftermath,' induced us to suppress reference to certain deficiencies in his agricultural and ornithological lore. Of these there were two or three instances, at least; and as one of them has already been pointed out by an excited Massachusetts farmer, we may as well mention the other principal one. It occurs in the tale of the greedy monk who was turned into an ass and then into a man again, in which latter condition he devoured from the face of the earth the countrywoman's last solitary fowl—a pullet, as Mr. Longfellow calls it. But looking back to the original entrance of this bird into the story, we find him described as "chanticleer," who certainly could not be a "pullet." What the Massachusetts farmer finds fault with is the pretty verses which give its title to the volume

"AFTERMATH."

"When the summer fields are mown,
When the birds are fledged and flown,
And the dry leaves strew the path;
With the falling of the snow,
With the cawing of the crow,
Once again the fields we mow,
And gather in the aftermath.

"Not the sweet, new grass with flowers,
Is this harvesting of ours;
Nor the upland clover bloom;
But the rowen mixed with weeds,
Tangled tufts from marsh and meads,
Where the poppy drops its seeds
In the silence and the gloom."

"Now look here," says the farmer, "will it be believed that all this is a tissue of misstatements?" A tiller of the ground who should let his rowen stand until "the falling of the snow" would everywhere be considered unworthy of his calling. And

". . . Rowen mixed with weeds,
Tangled tufts from marsh and meads,
Where the poppy drops its seeds"—

Mr. Longfellow must have got his knowledge of rowen from having seen somebody slashing away late in the season on some swamp or sea-shore for coarse bedding. We may add that we doubt if he ever, in any part of Massachusetts at least, saw any one thus slashing who cut down many wild poppies; we think that the Massachusetts poppy always requires the cultivating hand of man. However that may be, there are plenty more of these errors for the farmer's severe comments. "The upland clover bloom," for example, is almost never absent from rowen; which, moreover, is the sweetest of "sweet new grass," being more relished by the cattle, and more efficacious in brimming the pail and thickening the yellow cream, than the grass of any other season of the year. The time for cutting it is "by the middle of September," long before the snow flies, and while the leaves themselves have rather been burnished into fresh beauty by the early autumn than "withered" by frost. "Think," he bursts out, "of curing rowen in a snow-storm!" But Mr. Emerson, as well as many other poets before and after his time, have found that the farmer's acres yield to the poet many things and many kinds of things which to the farmer are invisible, and which he never reaps nor stores; and this aftermath of Mr. Longfellow's we may hold to be one of these, and may thus remain content with this little poem of a poet who, if he never cuts gems, does usually bring us in profusion pretty flowers gathered from the gardens, and from the forests and hillsides, and sometimes from the *hortus siccus* of literature, and in a naturally graceful order and array. It may be

permitted, also, to a poet who has so often carried us so far afield into foreign lands and other times, to cut his aftermath wherever, on the round world, he may please—in countries where, for instance, the rowen is a "rough pasture full of stubble and weeds," as it was in England in the day of Nicholas Bailey, *φιλόλογος*. Yet, doubtless, the other excuse is the better, and not insufficient.

—The distribution of seeds undertaken by our Bureau of Agriculture, assisted by members of Congress, has not, so far as we are aware, led to very important results. There would now appear to be an opportunity for it to distinguish itself, not by adding to the natural food-products of the country, but by acclimating a tree already known to possess medicinal properties, but whose greatest virtue is only beginning to be understood. In a recent communication to the French Academy of Sciences, it was stated that the Australian *eucalyptus globulus*, whose growth is extremely rapid, and whose dimensions rival those of the *sequoia*, has the capacity of absorbing ten times its weight of water from the soil, while at the same time it emits an antiseptic camphorous effluvium, and is thus doubly an antidote to malaria. This power of making marsh-land dry and of banishing intermittent fever has now been proved by experience in various quarters of the globe—by the English at the Cape of Good Hope; on a large scale in Algeria; in France, in the department of the Var; and in the island of Cuba. The salubrious action of the eucalyptus is, if the stories concerning it are to be believed, prompt and efficacious. A plantation only nine feet high, which had been set out near Algiers in the spring of 1867, is said to have prevented entirely the annual recurrence of fever in July of the same year, and to have maintained this immunity for the district ever since. The eucalyptus is already cultivated in California. Mr. Nordhoff speaks of one which grew twenty feet in a single year, and of another which, in eight years, from a small cutting had become seventy-five feet high, with a diameter of two feet at the base. What the range of this tree is in our climate it would be very easy for the Bureau of Agriculture to determine; and when we reflect on the vast proportion of our territory which is given over to chills and fever, it seems difficult to exaggerate the material and even moral advantages of a wide diffusion of the Australian evergreen. It would certainly do more than any other thing to promote immigration to the South. How far the West, with its rigorous winters, could profit from it remains to be seen.

—In a late number of the *Academy*, Mr. Walter Skeat addresses to the English philologists some remarks which, no doubt, have an application to our public also. "If," he says, "there be a study which, in English philology at least, has been completely ignored, it is that to which we would give the name of the Chronology of Etymology." And he trusts his readers will make a note of this, for he "makes bold to say that if the Chronology of Etymology could be once admitted as a leading and necessary principle of English etymology, one-half of the false derivations would speedily go by the board." We do not reproduce Mr. Skeat's italics, which lend to his style a sort of vehemence upon which we have recently commented in the case of verbal critics, and which in various forms and degrees marks not alone that school of writers, but their elders and biggers and betters in every etymological field. In some it is acrimonious and venomous, in others petulant, in others sardonic, in others eager, in others racily vivacious in a degree which is seldom attained by the man of letters as distinguished from the man of words (if we may offer that distinction), but in all betokening an energetic personal interest in the pursuit of their labors which would be not less than invaluable to a missionary among the heathen, say; or a young gentleman intent on marriage with a certain lady; or a friend of the coeducation of the sexes. We confess to a sort of liking for it when it appears as it is in Mr. Skeat's article. The faults he exposes must seem to him nefarious. "What happened the other day," he asks, when the Midland word *chure* was proposed for solution in *Notes and Queries*? Why, instantly forward came two writers who said that of course it was the German word *Thür*. "But what wild work is here!" says Mr. Skeat, and he adds that it is high time to "put aside such puerilities." How do we know, he enquires,—how do we know that, chronologically, the German word *Thür* ever existed in England before *chure*. "Indeed, we may ask what proof is there that High German was ever spoken in olden times in the Midland counties? If an Englishman knew what a *door* was, why should he trouble himself to pronounce it 'chure'?" The fact is that *chare*, which in Newcastle means "a narrow street or by-way," is identical with the Wiltshire *chore*, which means "a narrow passage between two houses," and with the Midland form, *chure*, meaning "a passage, by-way, or turning out of a larger road." To derive these various forms from the Anglo-Saxon *cerre* (flexus, viæ deflexio, diverticulum) is not absurd, "because we know that the verb *cerran* (to turn, with the various spelling *cyrran*) was in use in England before *chare* was, and that the change of *c* into *ch* satisfies the Chronology of Etymology." Then follows the remark about puerilities which we have already transferred to these columns. On the whole, it seems advisable; for the class of linguists is large "who have only a limited knowledge of etymology, and who are on that account constantly presenting new derivations which they cannot *themselves* perceive to be absurd." By the bye, Mr. Skeat's energetic protest against these suggesters of derivations is a digression in a pleasant essay on Trübner & Company's reprint of the famous 'Complaynt of Scotland,' edited by Mr. J. A. H. Murray.

—Owens' College, Manchester, the rising "university of South Lancashire," is prominently, though not exclusively, a school of applied science, including medicine. The thoughtful address of Principal Greenwood at the opening of the new building, upon the relations which subsist between culture and practical life, makes some points which deserve wider consideration. In reference to the claims made for the natural sciences to a leading place in academic study, he intimates that the weightiest argument in their support is the one the most seldom heard, namely, "that the natural and experimental sciences have a characteristic discipline for the mind. This position may in this place be taken for granted, and it constitutes of itself an argument at once unanswerable and sufficient. But when we hear the further argument, that physical sciences should hold a prominent place in education because their promotion contributes to the material advancement of the country, or because to possess a knowledge of them will give the learner a greater command of money, and what money brings, we are then offered motives of a very different order. As collateral motives, they have great value, I admit, . . . but a value subordinate to that of the former consideration. . . . It is true, too, that in choosing the subjects of study, regard should be paid in due degree to the destination of the future life. But when the secondary and by nature inferior aim takes the first rank, the fatal consequence follows that the higher good is not even sought in the second place." After contrasting the time-honored system of a common culture for the higher education with that by which, the common groundwork being reduced to the narrowest limits, the special training is made to begin with the first years of college, or even earlier, and suggesting that the two may be regarded rather as complementary than as rival claims, also that the subject-matter of the studies is of less importance than the discipline imparted, he concludes:

"This only is essential: that there should be such a selection made as will, first, draw out and strengthen the several powers of the mind, and, second, afford a basis so broad that on it may afterwards be erected the structure of professional study when the career is chosen. These conditions are met if the common groundwork includes, first, letters to cultivate the taste and judgment, to give a good style in speech or writing, and to place the student on the threshold of the best literature of home or foreign growth; second, mathematics, to discipline the reasoning faculty, to give the habit of concentrated thought, and to place in the student's hands a weapon indispensable for the mastery of the physical branches; third, some branch of physical study, to develop the powers of observation and inductive reasoning, and to impart the method of this study. . . . It might be added, too, in defence of the claims of this third prime element of culture, that it is singularly fitted to counteract the faults alleged, not without reason, to be inherent in the other two."

We should wish to add, as affording a characteristic discipline, not otherwise well supplied, the study of some department of biological science on the basis of morphology. Finally comes the remark which, it strikes us, is as reasonable as it is happily expressed:

"But, over and above these direct uses [of a common groundwork of culture for all students], there are at least two others which I can only indicate, first, grace and vigor are lent to social intercourse when men feel that they can trust to the possession by all of a certain general culture—that a common atmosphere, so to say, is shared by all, and that subtle criticisms, delicate shades of thought, apt illustrations, will not fall flat on the ears of half of those who listen. Those who are familiar with the social history of the first half of this century will agree with me that this element of social life was far more generally present with cultivated men than it is now; second, and again, from the want of this common elementary culture men are without that sympathy with the pursuits of others which tends so powerfully to soften the bitterness of controversy, and even to make fruitful discussion possible."

—The excavations carried on for nearly thirty years in the Roman Catacombs, and to which a stop was put by the difficulties of 1870 and 1871 between the Pope and the Italian Government, were fortunately renewed two years ago this month. What has since then been accomplished has been periodically made known in successive numbers of the Chevalier De Rossi's *Bullettino di Archeologia Cristiana*, which has had to record several new and interesting discoveries. For example, the latest excavations in the so-called "Catacomb of Pretestato"—where rest the remains of martyrs who suffered so early as A.D. 161 and 162—reveal the remarkable characteristic of having "much of its interior *architectural*, of regular and, in some parts, perfectly preserved construction, not merely excavated in the tufa rock as

are other such cemeteries." Moreover, at one extremity there has evidently been a brick-work front which opened upon the Appian Way or the Campagna near it. So, too, of the cemetery named after Nereus and Achilleus, servants of Flavia Domitilla, Domitian's grand-niece. And that part of the excavated area which is called after Domitilla herself has "a façade, a vestibule (or atrium) with a well, no doubt used for baptism, all in antique brick-work" and opening upon what was evidently a road near the Via Ardeatina. Now, the significance of these discoveries is held to be that "they attest the absolute publicity of the hypogœa serving for Christian use, and lead us to infer that neither the funeral rites nor such acts of worship as took place therein were secret, nor under any necessity of concealment owing to the social conditions of the church at Rome." All this is contradictory of the usual belief on the subject. "De Rossi shows," says Mr. C. I. Hemans, to whom we are indebted for our facts, "that the statements in church history as to bishops or priests residing in cemeteries" must be taken to mean that they resided in basilicas and other buildings near the entrance to the sacred places, "*above*, not in subterranean places *within* the excavated regions. The notion that, under pressure of persecution, numbers of Christians lived for safety's sake in such hypogœa must be rejected—not but that, in extremities of danger, some may have taken refuge in these underground retreats. It is known that certain of the Roman bishops did so conceal themselves in early times." We may mention, in conclusion, that in newly opened corridors and chapels of the St. Agnes Cemetery there have been found several of those little phials stained with a red substance supposed to be blood. Being always found in the tufa rock by the side of tombs, they have been decided by ecclesiastical authority to be proofs of martyrdom—evidence of the fate of those near whose remains they are found. A theory which has been advanced by some authors, who make the red substance in question to be sacramental wine, would appear to be decisively contradicted by the finding in one instance of an inscription, "Sanguis Saturnini."

—A correspondent writes us as follows: "As a contribution to the solution of the 'Abraham Cupid' mystery (see *Nation*, No. 411, p. 333), I send you the following extract from an old work of Rev. William Gurnall (1617–1679), entitled 'The Christian in Compleat Armour,' sixth edition, London, 1679, p. 4:

"Indeed, the World counts the Christian for his singularity of Life the only Fool; which I have thought gave the first occasion to that Nick-name whereby men commonly express a silly man or a Fool: Such a one (say they) is a meer *Abraham;* that is, in the worlds account, a Fool. But why an *Abraham?* Because *Abraham* did that which Carnal Reason (the Worlds Idol) laughs at as meer folly; he left a present Estate in his Fathers House, to go he knew not whither, to receive an Inheritance he knew not when.'

The italics, spelling, etc., are the author's. Does not the admitted existence of the 'nick-name' Abraham for fool bring the use of the patriarch's name into exact harmony with the context in Shakespeare? Mercutio, in his banter, had just referred to Venus in a tone of free familiarity, 'my gossip,' *i. e.*, in its old usage, a familiar acquaintance. Was it not perfectly in keeping with the spirit of raillery in which he speaks to call her 'purblind son and heir' by a 'nick-name' that should express a shade of contempt on Mercutio's part for Romeo's violent passion, calling him that 'young fool Cupid' rather than 'auburn Cupid' or even 'yellow-headed little impostor'?"

THE PRESENT STATE OF CUBA.*

A WORK which is dedicated to Sir John P. Grant, Governor Eyre's successor in Jamaica, commends itself at the outset, and this first favorable impression is confirmed the further one reads. The author spent only two months in Cuba, and about two weeks in Jamaica, but he well improved his time. His object being to study the causes of the insurrection, and its probable influence on the relations of the United States with the island, his narrative bears little resemblance to that of the ordinary tourist. It has the freshness, indeed, of the latest book of travels, Signor Gallenga having reached Havana the last week in January of the present year. The chapter which he devotes to this city does not exhaust the subject, but is a graphic summary of the most obtrusive and offensive features of the place, with a glance at the new quarter, and such modern improvements as the disappearance of the *volante* before the victoria and the horse-railway. Elsewhere there are few descriptions of scenery, but the physical aspects of the island are very well sketched.

We take a sincere pleasure in recommending for thoughtful perusal by all serious-minded Americans the clear presentation afforded by this work of the real state of things in Cuba, the author's reflections upon it, and his conclusions as to the future of the island, whether left to itself or interfered with by foreign powers. At this time especially, when a natural if not altogether healthy excitement pervades the country on account of the Santiago atrocity, prompting us to assume responsibilities of which it is impossible to foresee the end, it cannot but be salutary to heed an observer so enlightened, broad, and dispassionate as Signor Gallenga. Let it not displease his public here that two visits to the United States have not made him fall in love with its inhabitants, and that to distinguish us from other Americans (from whom we endeavor to usurp the generic name) he always refers to us as Yankees, with a shade of dislike and disparagement; or that, in alluding to the results of emancipation at the South, he seems to ascribe to the blacks excesses like those which produced "the worst calamities of San Domingo and Jamaica." On another page he remarks with more discrimination that "it is the fate of San Domingo rather than that of any other colony which seems to be impending on Cuba," inasmuch as "there is a war to be fought out between two white races—the Peninsulars and the Creoles—a war in which the emancipated negro will be called to play a part, and in which, whatever may be his own instincts and inclinations, he is not unlikely to work mischief to both parties."

What sort of a mess it is into which we are invited to plunge ourselves, may be described in a few words. A million and a half of people, nearly one-third of whom are slaves of the most degraded kind; the whites divided into Creoles, or native Cubans, also about half a million in number, and Peninsulars—Spanish carpet-baggers who have come to make their fortunes in the colony and to rule it meanwhile, holding all the important offices, dispensing all the patronage, and controlling the military through the chiefly Spanish organization of the volunteers. An insurrection, insignificant in extent, though capable of much mischief, and very destructive to the sugar industry, and really formidable as having the more or less secret sympathy of the Creole party. A warfare in which the volunteers, like a National Guard, stay at home to keep "order" in the principal towns, while the real fighting is done by imported Spanish troops, of whom more than 80,000 have been sent out since 1868, and by far the greater part have succumbed to the climate and the hardships of the campaign; a warfare in which 150,000 lives have been lost without any real gain to either side, and in which all prisoners are shot unless they are tortured to death—it being a practice with the insurgents "when a prisoner, and especially an officer, falls into their hands, to tie his feet up to a tree, and to pile up fuel under the dangling head, thus burning their enemy alive with a slow fire." A capital city which, being beyond menace of the insurrection, has a mercenary interest in keeping it up; which is ruled, like every other Cuban city, by a Casino Español, or Spanish Club, the headquarters of the Peninsular or slaveholding interest. A thousand and a half of slave-owners, of whom barely a tenth are solvent, and for whom the weakness of the mother-country is strength, and her calamity their opportunity. A civil-service than which, unless in a Turkish province, it would be hard to find one more corrupt or corruptible, so that, for example, "there is no contraband whatever; and no one would be at the trouble and peril of smuggling in Cuba when he can bribe the custom-house officers to any extent, and on any terms." A currency from which gold and silver have entirely disappeared, and which has become so much depreciated that "Spanish gold has risen to twenty-five per cent. premium, and foreign exchange to fifty-two per cent." A bank which, when it had ruined credit by an emission of twenty million unguaranteed bonds, and it was proposed by the new Spanish Intendente to burn paper money to a corresponding extent, replied: "Certainly, by all means, and with great pleasure. Burn twenty millions? To be sure! Forty, if you wish it. Have we not got the plates?" Finally, a condition of society in which "while the sexual numbers of the negro and mulatto population are almost balanced, with respect to the whites the proportion is something more than three males to one female"—including in the whites the Chinese, some 60,000 strong and all males.

Such is an imperfect outline of the picture drawn by Signor Gallenga of the "Pearl of the Antilles," and which, for the benefit of annexationists, we will supplement with a single sentence of his: "There is nothing more hollow, nothing more artificial, than the present wealth of Cuba, as it was in a great measure founded on a slave-trade which has come to an end, and rests on a slave-labor which is doomed." We have not space to follow him into all the considerations which lead him to apprehend the gravest difficulties in substituting free for slave labor in Cuba. He explains why emancipation was perfectly safe in Porto Rico. The island is wholly settled and cultivated; the slaves constituted but a twentieth of the whole population, and less than a tenth of the black; but above all "there is hardly any waste land, or 'provision ground,' where the emancipated slave may squat and live in idleness," as he did in Jamaica, and as it would be most easy and natural for him to do in Cuba, where only one-tenth of the land is under cultivation. He thinks it impossible "to free 350,000 blacks, chiefly African

* 'The Pearl of the Antilles. By A. Gallenga.' London: Chapman & Hall; New York: Scribner, Welford & Armstrong. 1873.

savages, and yet maintain the material well-being obtained by a vast production of sugar and tobacco." It is certain that the solution of this problem had better not be undertaken by the United States, and on this point we shall quote the author's well-considered judgment:

"It is difficult to see how the meddling of any foreign state, even if it could destroy Spain, could possibly save Cuba; how it could remove the difficulties of the island, or how it could help aggravating them. A foreign state could take up the cause of the insurgents; it could claim Cuba for the Cubans; it might break up the *Casino Español*, depose the Peninsular party from the height of their power, and ruin the slave-owners by imposing upon them the immediate emancipation of their slaves. Mere destruction is always only too easy. The ruin of the slave-owners must needs involve at least the temporary ruin of the country; and it is this that a foreign state would, above all things, be anxious to avoid. The assistance of a foreign state would certainly ensure the victory of one party over the other—say of the Creoles over the Peninsulars—but a victory would not preclude the struggle; and such a struggle, between two races animated by deep-seated resentment and burning to revenge long-treasured grievances, is precisely what a foreign state, prompted by humane motives, would be most anxious to prevent. It comes to this—that if parties in Cuba are bent on mutual destruction, all that a foreign state could do would be to help and hasten them on their way to it."

In support of his opinion that "the whole question of the Cuban insurrection is subordinate to that of slave and free labor, and must be studied not merely in Cuba, but also in other countries where slavery has lately ceased to exist," our author crossed the narrow strait from Santiago to Jamaica. He found there a number of the leading Cuban refugees, many of whom had improved their condition by purchasing the cheap estates of the British colony, and gone on planting sugar, coffee, and tobacco.

"It is not without great astonishment," says Signor Gallenga, "that these new Cuban settlers become familiar with some of the peculiarities of English law in their new home. One of them was lately involved in a lawsuit about the title-deeds of an estate he had purchased against no less a person than the Queen of England, as owner of the Crown domains in her good island of Jamaica. The Cuban, with great misgiving, brought his action into court at the earnest suggestion of his lawyer. The case was tried, and the Cuban—won the suit! Think of the Government ever allowing itself to be beaten by a private subject, and he an alien, in Spain or in her colonies!"

Our author pays a deserved tribute to Sir John Grant, under whose wise and impartial autocratic rule "there has been for seven years a progressive rise in the revenue, and a cheering annual surplus." Moreover, "the allowance for public instruction, which was only £4,622 in 1866, has now been raised to £19,403"; and "the highways, which at the time of Mr. Trollope's visit in 1859 were 'no roads,' are now as good as the best in England." Nevertheless, Signor Gallenga appears not wholly satisfied with the condition of the colony, from which the traces of the former existence of slavery have not wholly disappeared in the relations of the two races, and seems to think it will require a special and determined effort on the part of England to prevent in Jamaica, as in Cuba and the rest of the Antilles, the ascendancy of the black population. "There is only one spot in the West Indies, Hayti, where the negro has established his empire by violence; but I see symptoms everywhere of his desire to make himself at home by peaceful means throughout the tropics."

THE INDIAN IN LITERATURE.*

THERE are reasons for believing that a majority of the reading public, and a large proportion even of those who read *books*, look upon the "red man" as holding a closer than Darwinian relation to the lower animals. They find it easy to think of him as a wild beast, hard to believe that he is entirely human. One fact among many that ought to teach them better than this is the place which the red man holds in literature—not indeed as author, but as subject. He has not done much in the way of book-making, for at the time of the discovery he had hardly risen above a state of barbarism in any part of the continent, and his course has been downward ever since. But in the literature of the nations of Western Europe he has for nearly four hundred years occupied a conspicuous place and made a striking figure; and in that wide field he produces upon those who study him an impression, not of bestiality nor of mere ferocity, but of a multifarious and attractive humanity. It is not only the amount but the kind of attention he receives; not only the large place he fills, but the way in which he fills it, that convinces the student of the literature relating to the American races that the Indian is akin to ourselves, partaker of the same human nature and heir to the same destiny.

A vivid and yet inadequate conception of the vastness of this Indian literature is conveyed by even a slight examination of Mr. Thomas W. Field's 'Essay towards an Indian Bibliography.' It is a volume of four hundred and thirty octavo pages, and contains more than seventeen hundred titles of books and pamphlets. The number of volumes included in the list is of course much greater than this; while, if we omit new editions and reprints, the list of distinct works must number fourteen or fifteen hundred. Yet this, far from being a complete catalogue of Indian books, is simply an enumeration, with notes, of those in the author's own library. It is a selection of titles from a list of "more than two thousand five hundred separate works and twelve hundred essays"—a list, he tells us, which he had long been at work upon before the territory to be examined "began to exhibit its formidable proportions." So that it is not undue modesty that prompts Mr. Field to speak of his book as an "essay towards" an Indian bibliography; such a designation is strictly correct.

In the first place, there are extensive districts in the broad realm of aboriginal literature which are scarcely touched upon in this bibliography. Although the author's plan embraces "both Americas," it is only North America that is fairly represented, and in this department it is only the Algonkin and Iroquois races that receive anything like adequate treatment. Into the vast Spanish literature relating to the races and languages of Mexico, Central America, and South America—the letters and journals of discoverers and conquerors, the grammatical treatises, translations, and "relations" of Catholic missionaries—Mr. Field appears to have made a successful reconnoisance here and there, but scarcely anything more than this. And in the department which he has chosen as his special field there are numerous and remarkable omissions. So many and so conspicuous are the works left out, that the reader cannot help feeling that the book is fragmentary in its character, and at some points anomalous. The author has sought to anticipate and avert such a verdict by calling attention to the fact that he offers us simply a list of works in his own possession. But at the same time he gives notice that "in a limited number of cases, marked with a star," other books have been admitted to the catalogue; and the thought forces itself upon us that he ought to have made only a selection from his extensive library according to some definite plan, or else to have included a much larger number of books known but not yet purchased.

One might reasonably expect to find in such a bibliography as this a full list of authors who had previously undertaken a similar task. Perhaps it was well enough not to mention the general catalogues of "Americana," from Rich to Sabin; but surely Mr. Field would have been doing only what is appropriate and handsome had he given, after the example of Ludewig in his 'Literature of the American Aboriginal Languages,' a separate introductory list of bibliographers who have made a specialty of Indian books. But in this, as in other departments, the omissions are many and remarkable. He mentions Ludewig, but scarcely another bibliographer. There is no allusion to Pinelo's 'Epitome,' Antonio's 'Bibliotheca,' Vater's 'Index Linguarum,' De Souza's 'Biblioteca,' Schoolcraft's 'Bibliographical Catalogue,' Haven's 'Archæology' (which is largely bibliographical), Squier's 'Monograph,' the very valuable 'Apuntes' of Icazbalceta, the 'Bibliothèque' of the Abbé Brasseur de Bourbourg, or Harisse's 'Bibliographie de la Nouvelle France.' In a department lying adjacent to this last, he mentions Adelung and Pimentel and Buschmann (eleven of whose works he enumerates, although he owns but two of them), but omits Hervas, Gilii, Court de Gébelin, Balbi, and Mr. Horatio Hale's 'Ethnography and Philology.' He includes in his list Stephens's 'Incidents of Travel in Central America,' and 'Incidents of Travel in Yucatan,' but does not mention the splendid folio of 'Views of Ancient Monuments' by Catherwood, Stephens's fellow-traveller. He includes Del Rio's 'Description of the Ruins near Palenque,' with Cabrera's dissertation (making no allusion, however, to Minutoli's German edition), and Dupaix's 'Antiquités Mexicaines,' but does not mention Waldeck's large work on the same subject, nor the Abbé Brasseur's 'Manuscrit Troano,' nor Charencey's interesting pamphlet on the decipherment of a Palenquean inscription. Lord Kingsborough's gigantic work on Mexico is not alluded to. He mentions Mr. Lewis H. Morgan's 'League of the Iroquois' and his pamphlet on the 'Laws of Descent,' and even his book on the 'American Beaver,' but omits his splendid Smithsonian quarto on 'Systems of Consanguinity.' He omits Humphrey's valuable 'Account of the Society for the Propagation of the Gospel,' although he refers to it incidentally in his note on the Mohawk Prayer-Book. This note is an excellent specimen of thorough bibliographical work, yet he omits to mention in it the Boston edition, "printed by Richard and Samuel Draper." Indeed, he does not seem to be aware of the existence of this abridgment, published in 1763. He includes in his list a Seneca primer in use on the reservations in Western New York, but does not allude to the 'Spelling-Book' printed at Buffalo Creek, nor to the interesting little periodical in Seneca, the *Mental Elevator*. He gives a full account of Father Cuoq, of the Mission at the Lake of the Two Mountains, Canada, and a list of his writings, yet does not mention 'Le Livre des Sept Nations,' a very full and

* 'An Essay towards an Indian Bibliography. Being a Catalogue of Books relating to the History, Antiquities, Languages, Customs, Religion, Wars, Literature, and Origin of the American Indians, in the Library of Thomas W. Field. With Bibliographical and Historical Notes, and Synopsis of the contents of some of the works least known.' New York: Scribner, Armstrong & Co. 1873.

interesting liturgy, prepared for the use of that mission in the Algonkin and Iroquois languages.

A similar unevenness may be observed in the enumeration of the various editions of the different works included in the catalogue. The bibliographical account of Las Casas, for example, fills sixteen pages, and includes a minute list of his numerous writings; but of Herrera and De Solis only a few editions are mentioned, and of Bernal Diaz only the English translation. He includes in his list Father Baraga's works on the Otchipwe language; and when we remember the treatment he accords to Zeisberger (under the title, De Schweinitz), we naturally look for a good note concerning this devoted missionary and his grammar; but Mr. Field contents himself with merely recording the title of this rare and valuable work. Some of these inconsistencies are so marked that they might almost be called blunders; but perhaps it is not fair, in view of the explanatory statements of the preface, to lay much stress upon them. Of real blunders, however, the volume furnishes some notable instances. One of the worst occurs on pages 43 and 44, where *Quiché*, the name of a Central American people, is translated *Quichua*, which is the name of one of the races of Peru. Of the various grammatical errors in the book, we may mention one on page 145, where "dicta" is used as a singular noun, instead of "dictum." But the most curious mistake is one that occurs on page 111. On the title-page of Du Ponceau's 'Mémoire,' the authorship is given thus: "Par M. P.-Ét. Du Ponceau," the initials representing the name Pierre-Étienne (in English, Peter Stephen). But Mr. Field has mistaken the "Ét." for the conjunction *et*, and translates: "Written by Mr. P(ickering) *and* Du Ponceau"! He ought surely to have known that the 'Mémoire' was written exclusively by Du Ponceau, and that Pickering had nothing to do with it.

Other errors might easily be pointed out; but we desire to say, with emphasis, that in comparison with the numerous excellences of the book, they are not worth mentioning. The errors are for the most part of a negative kind; the excellences are positive and manifold. It is, first of all, an extensive and important catalogue of Indian books, being without a competitor in this respect; and, secondly, it is a repertory of important facts in literature, history, and biography. The notes, which constitute a large part of the volume, and in which its value largely consists, are worthy of special praise as specimens of thorough and accurate bibliography. They represent an amount of conscientious labor which only those can appreciate who have attempted the same kind of work. There is evidence on every page of industrious research and careful comparison, and the conclusions reached are stated in a succinct and interesting style. Some of these notes are of decided value as historical summaries, or at least as finger-posts to guide the historians of the future. At the same time, they abound in items of information which ought to prove interesting to the general reader—such, for instance, as the identification of the name of the great city of the West with that of the Illinois chief, Chicaugou (p. 239). Throughout the volume the author reveals himself as a genuine collector, with a real love of books for their own sake, but never as a bibliomaniac, with the foibles and littlenesses of that class. He betrays, also, a considerable warmth of affection for the red race, which he looks upon as having been cruelly oppressed by the white man. The bibliographer is never a scientist, pure and simple, but ever the champion of somebody's cause; and Mr. Field takes upon himself at every opportunity the thankless championship of the red man. In some of his simple and quiet statements of forgotten facts, as, for example, in the account of Chivington's massacre of the Cheyennes, on page 85, there is revealed a hidden fire of indignation against the atrocities of the whites, whom he does not hesitate to describe, in another note (p. 86), as "more civilized, but not less barbarous," than the Indians of the Plains.

That the red men are doomed to disappear seems tolerably plain. But we have in the contents of this book a proof that they will not pass into oblivion, for no other aboriginal race, extinct or perishing, has been so well put on record. Their ethnological characteristics have been carefully noted, their customs have been described, their traditions and myths have been faithfully recorded, and a large number of their languages have been reduced to writing and embalmed for ever in translations of the Scriptures. The volumes in which these results are stored up are becoming more and more prized, and are more and more brought together in public and private libraries. The noble collection catalogued in Mr. Field's 'Essay' is but one of many already formed or in process of formation at the East and the West and in Europe. The taste for collecting such works is not a mere fancy, it springs from a real interest in a people and in the scientific study of human nature and human institutions as represented in a vanishing race. To the American nation, just now, the Indian presents a disagreeable problem; but to the civilized world, as a whole, he constitutes a most interesting and attractive phenomenon. That the proper study of mankind is man is a doctrine likely to be more and more believed in and practised upon for a long time to come. To the advancement of this study, Mr. Field's bibliography will contribute important aid, both as an index of materials and as a repository of facts.

Journal and Letters of Col. John May, of Boston. 1788–89. (Cincinnati: Robert Clarke & Co.)—Col. John May was uncle to the late Rev. Samuel J. May, of Syracuse, by which statement we simply mean to refer the less known to the better known, and not to imply that there was any lack of character in the elder May. In fact, he had great strength and individuality of character, and the evidences of it furnished by this diary of two journeys to the Ohio country, quite as well repay the reader as the account of his experiences in coming and going, and at the infant settlement on the Muskingum. By no means neglecting his church duties at home, he found himself at variance with Connecticut Puritanism. When riding through that State, on the road to New Haven, he says: "After breakfast met numbers of people going to meeting, in their old clothes, it being fast-day [April 17]. We were accosted by some sort of Sunday officer with, '*What makes you ride fast-days?*' Which I returned with a look that told him it was none of his business, and kept my horse under way." Three days later, when he had reached New York: "My business crowded me so hard that, although it was Sunday, I thought it my duty to write all day, and arrange my papers. I also felt necessitated to swap away my lame horse for one that was sound." There was no hypocrisy about him, and he could devote his secular leisure to "examining within," with the satisfaction of finding that "I had been on the whole faithful, that oftentimes I had doubled my duty, and that nothing was left unattempted that was within the reach of my feeble human arm." He was an early riser, and at three o'clock in the morning was either walking in the open air or writing. When "full of rambling pains," "scarcely able to keep about," and "grunting," he would nevertheless seize the axe "in order to stir my blood, as well as to stimulate others." When his people at Marietta complained of the cold, "I got up, took a bucket, and threw two hundred buckets of water into the boat, which washed her well. I then said, 'Now, my lads, throw all that water out.' By the time they had cleaned her out they were warm enough." On occasion of a false alarm, he remarks: "We may always expect trouble while travelling through this life, which is nothing more than a wilderness world. We ought to make the best use we can of these matters, small and great. At Boston we have frequent alarms of fire, and inundations of the tides; here the Indians answer the same purpose." His general opinion of the Indians had more affinity with the Puritan than the Darwinian theory of their descent: thus he says, "One of their chiefs died day before yesterday, and another, as I learn, is just going to his black master."

Colonel May observes that New York "is not so large as Boston, but does a great deal more business," and tells of "a pile of new buildings belonging to a Mr. McComb," which were by far the finest he had ever seen. "In one of the entries I travelled up five flights of stairs—the rail continuous from bottom to top. I still left one flight unexplored." At the Indian Queen in Baltimore there were "twenty-seven bells of different sound hanging in the bar-room, all numbered, and belonging to twenty-seven different rooms"—which was "keeping tavern in high style" for those days. The Colonel also made note, as a family man, of approved recipes for worms and for bread, and took great pleasure in describing the excellent variety of fish with which the waters of the Ohio abounded. His humor, sometimes a little coarse, is displayed in his account of an attempt to discover a drowned body by floating a loaf of bread wrapped up in a shirt which the drowned man had last pulled off—an experiment which failed by the sinking of the loaf, and naturally could not be repeated. A week later we find this entry in the Journal: "The body of Frederick M. has just now floated, but has left shirt and provisions behind." The second journey to the Ohio country enabled Colonel May to witness the inauguration of Washington as President, which he reports at some length. The value of the original documents is greatly enhanced throughout by the learned and judicious notes of Mr. William M. Darlington, of Pittsburgh, while a grandson of the author, Rev. Richard S. Edes, furnishes a compendious sketch of his ancestor's life and pedigree. The volume is beautifully printed, and is the first of a new series of publications by the Historical and Philosophical Society of Ohio

---

A Concise Analytical and Logical Development of the Atmospheric System and of the Elements of Prognostication. . . . Adapted to the Practical Mind of the Country. By T. B. Butler, author of 'The Philosophy of the Weather.' With cuts illustrating the varieties of clouds, and plans showing the paths of tornadoes and the distribution of rainfall over the United States in different months of the year. (Norwalk, Ct.: A. Selleck. 403 pp. 16mo.)—Mr. Butler is a scientific enthusiast, whose self-control, although very imperfect, is yet in a very fair proportion to his energy as contrasted with the

uncontrol of most of those who allow their enthusiasm to express itself. His book is therefore uncommonly readable, owing to the tension of feeling under which it was written. The conciseness to which he lays claim on his title-page may be conceded, for concise is a relative word; but his style is too vehement to endure the trammels of logic. Force, however, is a positive and cardinal quality, and in this case it is combined with another quality which renders his book one of the least untrustworthy works upon meteorology which have appeared—viz., its point of view, though narrow, is closer to the ground-level of facts than the standpoints of other writers upon the subject, who are carried aloft by their fondness for chosen hypotheses. Mr. Butler's eagerness is directed rather to lucid, generalized statements of leading facts than to suppositions in explanation of these facts. He says in the preface: "I have avoided, as far as possible, the consideration of theories. I have come to regard them, and the men who persistently and against new truths as discovered promulgate and teach them, with a degree of disgust which I have not been able to restrain." A good example of this disgust occurs in his comments on a lecture by Prof. Henry during a breeze, the direction of which was apparent from the motion of the loose clouds in it:

"If that southerly wind had been created by the suction of a vortex, it would have *obeyed the law of its creation, and gone up the vortex.* But there it was, visible from the seat I occupied during the lecture, *moving as I have seen it a hundred times,* AND WITHIN 2,000 FEET OF THE LECTURER'S HEAD, *a conclusive refutation of the fundamental doctrine of his lecture.* In the debate which followed, I alluded to it. . . . It was conceded, and the fact cannot be denied, that if there was such a vortex the wind and scud must ascend it, and could be seen to do so. And I offered Prof. Henry $50 a scud for every one he would prove to have been seen so ascending. Prof. Loomis asked for a renewal of the proposition, saying he was up for a speculation. It was renewed AS A STANDING OFFER and in good faith, although the discovery of a single vortex would sweep away all I possess. It is now ten years since, and no vortex has been discovered or money called for."

The italics are the author's. This passage indicates his practical directness, and also the motive power of the book, which is hatred of Halley's hypothesis that storms are created by the upward suction of heated tracts of air. It is true of this as of many controversies, that it is futile, from the refusal of each side to understand the other's use of terms; and all the pages which our author so hotly devotes to it miss their aim, because he forgets that a current may ascend without ascending so steeply as that its ascension shall be conspicuously more rapid than the simultaneous descent through it of the cloud-vesicles suspended in it (for clouds are always falling, though they seldom appear to fall, because their under-surface is being evaporated by heat reflected from the earth, and because the air which floats them is usually being tilted upward by rising land or by a neighboring mass of heavier air). Another unfortunate misuse of terms in the statement of Halley's hypothesis, which goes far to justify our author's contempt for it, is the implication that an "upward suction" is the fountain of force, which is a reversal of cause and effect much as if it were said of a mixture of oil and water that the lightness of the oil forced the water downward, whereas the buoyancy is merely a weakness, the heaviness of the water (and, in the case typified, of the colder air) being the positive force which commences the motion, so that the warmer air should be said to be crowded up, not sucked up.

Mr. Butler spends many pages in proving, against the cyclonic theory, the idle criticism that there exists great inequality between the winds on the different quarters of the revolving areas. But no one denies this. That wind is the strongest which blows from the largest area of heavy air, and covers most surface; thus, on our coast, summer cyclones are preceded by long sea breezes (S.E.), and winter cyclones are followed by long gales from the land (N.W.)

Several collections of rules for predicting the weather are concisely and lucidly discussed. The chief scientific value of the book is its recognition of the fundamental importance of tracing the movements of the areas or belts of greatest rainfall from month to month. The last chapter attempts to prove that electricity is the cause of all meteorological phenomena.

BOOKS OF THE WEEK.

Authors.—Titles.	*Publishers.—Prices.*
Adler (Prof. F.), Der Felsendom zu Jerusalem, swd.	(L. W. Schmidt)
Byr (R.), The Struggle for Existence: a Tale.	(H. N. McKinney & Co.)

HARPER'S CATALOGUE. The attention of those designing to form libraries or to increase their Literary Collections, is respectfully invited to Harper's Catalogue, which comprises a large proportion of the standard and most esteemed works in English Literature—*comprehending over three thousand volumes.*

Librarians, who may not have access to a trustworthy guide in forming the true estimate of literary productions, will find this Catalogue especially valuable for reference.

The Catalogue is arranged alphabetically by the authors' names, anonymous works by their titles. The index is arranged by the titles of the books, besides having numerous appropriate heads, each general head being followed by the titles of all works on that subject.

Harper's Catalogue sent by mail on receipt of six cents.

Address HARPER & BROTHERS, Franklin Square, New York.

"It can only be added, therefore, that in style and narrative the book reminds one somewhat of George Eliot's 'Scenes of Clerical Life,' and will not sustain a very unfavorable comparison with them."—*Cincinnati Gazette.*

THE THIRD THOUSAND.

HESTER MORLEY'S PROMISE.

BY HESBA STRETTON,

Author of 'The Doctor's Dilemma,' 'Bode's Charity,' etc. $1 75.

DODD & MEAD, Publishers, New York.

"The faithful novel-reader, weary of the stereotyped heroine and society novel, may turn to 'Hester Morley's Promise' with confidence and hope. The reading of it cannot fail to give pleasure, it is written in a style so fresh and bright."—*Publishers' Weekly.*

FOREIGN BOOKS Reviewed in the *Nation.* and books in all languages, at SCHOENHOF & MOELLER'S, Importers, 40 Winter Street, Boston.

DRS. REYNOLDS BROTHERS, Surgeon Dentists, 62 West Fourteenth Street, New York, have made the study and practice of Dentistry in all its branches a life work. Painless extraction of teeth.

JUST PUBLISHED:

A Fresh Work on Mining.

SILVER AND GOLD: An Account of the Mining and Metallurgical Industry of the United States, with reference chiefly to the Precious Metals. By Rossiter W. Raymond, Ph.D., Commissioner of Mining Statistics, President of the Am. Inst. of Mining Engineers, Editor of *Engineering and Mining Journal*, Author of 'Mines of the West,' 'American Mines and Mining,' 'Mines, Mills, and Furnaces,' etc., etc. 1 vol. 8vo, with plates, $3 50.

Mr. Raymond's rare intelligence and intimate acquaintance with mining and metallurgy, manifested in his writings on these subjects, have been widely acknowledged, and his reputation will ensure an interest in this, his latest work.

"Contains valuable papers on subjects intimately connected with mining industry, in which some new and original theories are advanced, and which will bear the reading and thoughtful consideration of the professional scientist as well as the practical miner and smelter."—*San Francisco Evening Bulletin.*

"The work bears ample evidence of diligence and care in its preparation."—*N. Y. Tribune.*

*** *To be had of all Booksellers, or will be sent, postpaid, on receipt of price, to any address, by the Publishers.*

J. B. FORD & CO., 27 Park Place, New York.

WINTER RESORT. Highland Park Hotel, Aiken, S. C. Aiken has long been famous for its delightful climate, and is a favorite resort for those who seek to escape from the inclement winters of the North without experiencing the tropical heat of Florida and the Gulf. The Highland Park Hotel was established for the accommodation of this rapidly-increasing class of visitors. It is conducted after the manner of the best Northern hotels, and has already achieved a gratifying success. For terms, etc., apply to B. P. CHATFIELD, Proprietor, Aiken, S. C. Also proprietor of Planters' Hotel, Augusta, Ga.

ECLECTIC MAGAZINE Of Foreign Literature and Science. $5 a year, 45 cents a copy.

E. R. PELTON, Publisher, 108 Fulton Street, N. Y.

THE WEEK IN TRADE AND FINANCE.

NOVEMBER 17.

CONTRARY to general expectation, there has been no change made in the Bank of England rate of discount, which remains at 9 per cent., to which point it was raised at a special meeting, November 7. The news received from London during the latter part of the week was favorable, and there is every indication that the anticipated trouble has been avoided by the prompt action of the Bank in raising the rate of discount.

The situation here shows further improvement; the banks have added considerably to their reserve, especially in legal tenders, which now amount to $28,380,000, while the loan certificates have been reduced to $18,000,000, against $22,000,000, the amount outstanding a week ago. The principal event of the week was the report of the "Committee of Nine," appointed by the Clearing-House Association to consider carefully and report what reforms were required in the practical operations of banks with each other and with the public to increase the security of their business. The report says:

"Having now considered the prominent evils which exist, the removal of which your Committee consider as indispensable to the harmonious intercourse between banks bound together by common interests, and having recommended for their approval:

"1st. That payment of interest on deposits, either directly or indirectly, be entirely prohibited.

"2d. That each bank, while it observes the requirements of the law of Congress respecting a reserve fund, be required to carry at all times an amount of legal-tender notes equal to at least fifteen per cent. of its liabilities to the public.

"3d. That no bank shall certify a check as good until the full amount of it shall appear upon its books from a deposit regularly entered to the credit of the drawer.

"4th. That no check or draft shall be received by a bank upon deposit at par as cash, drawn otherwise than upon one of the banks composing the Clearing-House Association.

"5th. That all checks and drafts upon places out of the city of New York shall only be taken at rates of discount established monthly by the Clearing-House Committee."

Money on call was easy through the entire week at 7 per cent., and there was a difficulty in lending it most of the time at that. Commercial paper moved more freely, sales being reported at rates varying from 12 to 18 per cent.

The following shows the highest and lowest sales of the leading stocks at the Stock Exchange, for the week ending November 15:

	Monday.		Tuesday.		Wed'day.		Thursday		Friday.		Saturday.		Sales.

The stock market has been active during the greater part of the week. On Wednesday and Thursday prices advanced rapidly, led by Western Union and the other Vanderbilt specialties. There has been some reaction since, one of which was caused by a circulation of a false report of the death of Commodore Vanderbilt. The market closed strong on Saturday, with every indication of a still further improvement in prices in the absence of any unfavorable news.

The following is a condensed abstract of the report of the Committee on Finance of the Pennsylvania Railroad Company in relation to a declaration of a dividend of the profits of the Company for the six months ending October 31, 1873:

The receipts of the Pennsylvania Railroad and branches for the six months ending October 31, 1873		$13,202,701 82
The receipts of the united railways and canal of New Jersey for do		5,625,267 77
Total		$18,827,969 59
The expenses of the Pennsylvania Railroad and branches for six months	$8,071,393 60	
The expenses of the united railways and canal of New Jersey for do	3,940,986 76	$12,012,380 36
Leaving a balance of		$6,815,589 23
To which add income from investments in other lines, real estate, etc., after deducting interest paid on floating debt during same period		994,927 16
Total net income		$7,810,516 39
From which deduct interest paid upon all of the bonds of the Company	$974,956 20	
Semi-annual payment for purchase of main line of public works of the State	230,000 00	
Rent of Harrisburg and Lancaster Railroad	65,123 29	
State tax on coupons and capital stock	215,751 18	
Semi-annual payment under lease of the united railroads of New Jersey	1,820,249 28	$3,306,079 95
Leaving a surplus for division of		$4,504,436 44
Out of which a dividend of 5 per cent. upon the capital stock of the Company is recommended, amounting to		3,363,419 37
Showing surplus of profits of		$1,141,017 70

The Committee go on to state that, in consequence of the financial panic, they are compelled to recommend the payment of a dividend of 5 per cent., payable in scrip; the money out of which it was proposed to pay it having all been absorbed in meeting payments for work, for additional rolling-stock, etc., all necessary to meet the increased business of its railways.

The Government-bond market is strong, and prices are higher. The improvement in the financial situation abroad has brought about a sharp advance in American bonds in London, which has influenced the home market; while the rise in gold has greatly aided in sending up the currency quotations of our bonds here. The investment demand for Governments is reported to have been very good during the past week. The present low prices for bonds seem to attract investors of that class who look more to the safety of their principal than for large returns in the way of interest upon their money.

In railroad bonds business has been fairly active, and prices are higher. The demand for the Union Pacifics has been greatest. These bonds are certainly low enough, as a speculation merely, to buy at present prices—75 for the First Mortgage 6's, 70 for the Land-grant 7's, 50 for the Incomes.

The gold market has been strong and active. The premium has advanced, owing to an increased demand which has come from the merchants, as well as to the Spanish troubles which threaten to arise in consequence of the recent outrages in Cuba. The range of fluctuation has been between 107 on Wednesday and 110 on Saturday, closing at 109⅛ on Saturday.

NEW ENGLAND MUTUAL LIFE INSURANCE COMPANY.

HISTORY OF ENGLISH LITERATURE. By H. A. TAINE. 2 vols., cloth, $7 50.

Sent, post-free, on receipt of price. Address
PUBLISHER OF THE *NATION.*

The Nation.

NEW YORK, THURSDAY, NOVEMBER 27, 1873.

The Week.

ACCORDING to the latest accounts, the number of men killed by the Spaniards at Santiago was fifty-three. Mr. E. G. Schmitt, United States Vice-Consul, and Theodore Brooks, British Vice-Consul, did their best to save the prisoners. Schmitt sent three despatches to General Burriel, the first as early as the 2d of the month, calling the latter's attention to the fact that he, Schmitt, was prevented from using the telegraph to Kingston, requesting to be allowed to see the prisoners who were said to be American citizens, and in general to be permitted to perform his consular duties. To these communications General Burriel made for at least twenty-four hours no reply, and then sent word to the Vice-Consul that the reason he had not answered the first of them was that he, the Consul, ought to have known it was a day of religious festival, and that he and all the other servants of the Government were given up to "meditation on the divine mysteries," and threatened the withdrawal of Mr. Schmitt's *exequatur*, on the ground that he was "compromising the dignity" of the United States, and trying to make trouble between the United States and Spain. To Mr. Brooks's protest against the execution of those among the prisoners claiming British citizenship, General Burriel replied that he regretted extremely his inability to take any steps in the matter, for the prisoners had been already killed. Ryan, it seems, was born in Canada, and did not claim American but British citizenship. In Madrid, popular feeling seems to run high, and demonstrations have been made against General Sickles, but they have been repressed by the Government.

Ex-President Woolsey, in one of his college lectures on international law, has expressed his views on the *Virginius* outrage. He says that the two questions of the capture of the vessel and the punishment of the prisoners must be kept distinct; that, as to the latter, nations in general make their own usages of war, inhuman or humane, as the case may be, and that usually other nations have nothing to do with them; though, in extreme cases, interference in the interest of civilization has been thought morally justifiable; that whether *one* case of inhumanity, and that a result of judicial trial, would call for interference "is a point which an incomplete knowledge of the circumstances puts it out of our power to decide. It may be that the just wrath of the Cubans against long-continued insurrection fed from abroad called for an example. It may be that a fiendish spirit of savage cruelty, going up from the populace to the courts, wreaked itself in a horrible way. I leave this to be decided by those who can get greater light and more trustworthy accounts than have come to me." As to the seizure, President Woolsey takes the view expressed last week in these columns, that the American ownership of the *Virginius* was a "sham," and that, under similar circumstances, no nation under heaven would have allowed what was in reality an insurgent vessel to escape. The name of the ship on the register, by the way, is said to be *Virginia*, and not *Virginius* at all.

We alluded last week to the fact that the accounts given in the newspapers of the great mass-meeting at Steinway Hall were inaccurate. Several small items of news, which have since come to light, show the manner in which the enthusiasm of the meeting was got up. One of the despatches read to the audience was the following, sent by Governor Hendricks of Indiana:

"INDIANAPOLIS, IND., Nov. 17, 1873.

"Spain cannot be permitted to maintain her authority in Cuba by means which civilized nations regard as atrocious, and, in the cause of humanity and good government, the United States should now extend their sympathy and power over that island. I think this is the sentiment of the people of Indiana. THOMAS A. HENDRICKS."

This despatch called out the most enthusiastic applause. It seems that it was sent in answer to an urgent request from the committee in charge that Governor Hendricks would send a "stunning despatch" to be read at the meeting. It has also come out that Mr. Sumner, in reply to the request addressed to him, wrote a letter of a very calm and moderate tone, deprecating a war excitement. This letter is dated "Boston, Nov. 15," but for some reason or other did not reach the committee till the 18th, so that they were unfortunately unable to read it to their fellow-citizens on the evening of the 17th.

The Cuban "excitement" is, we presume, rapidly subsiding. All we know about it we have learned from the daily papers, and they have nearly all changed their tone within a week. Where the "excited" persons are, we are as ignorant as ever. We would warn people most earnestly, however, against secret "excitement"—nothing racks the constitution more severely. Anybody who is wrought up by the *Virginius* affair ought therefore to come out and give free vent to his feelings in the presence of his countrymen. The Government in the meantime, we are glad to say, goes on its way soberly and sensibly, taking information and looking into the books, and the probability increases that the matter will be settled amicably. But we are bound to say that we think no settlement will be satisfactory which does not provide for the punishment of General Burriel. His refusal to delay the executions, and his stopping the consular telegrams, admit of no palliation, and show him to be a dangerous fellow, to whose jurisdiction, either in peace or war, no civilized government ought to permit its subjects to be exposed. His excuse for not answering Vice-Consul Schmitt's letters, that he received them on a saint's day when he was "meditating on the divine mysteries," is a capital specimen of the mixture of piety and ferocity which has long formed a prominent feature of the Spanish character. Coupled with the Archbishop's boast of the conversion of the twenty poor devils who, probably in the hope that baptism might save their lives, put themselves in the hands of his priests at the last moment, it presents an excellent picture of the kind of contribution the annexation of Cuba would make to our morals and our politics. It is well, before passing from the subject, to remind the uproarious patriots who are publishing lists of the frigates we are getting ready to thrash the Spaniards, that all our large wooden screws would be sent to the bottom by one tap apiece from an iron-clad, just as the *Cumberland* and *Congress* were in 1862 by the *Merrimac*, and that it is very doubtful whether any one of them would not be disabled by the explosion between decks of one of the shells which big naval guns now throw. So we recommend that all mention of them be omitted from our calculations. They are only good for capturing merchant vessels, or bombarding lightly armed fortifications.

Tweed was sentenced on Saturday by Judge Davis to twelve years' imprisonment (twelve terms of one year each) in the county jail, and to a number of fines which in the aggregate amount to $12,750 18. His counsel made an attempt to obtain a stay of proceedings, but without success, and Tweed is probably at this moment engaged at hard labor in a convict's uniform on Blackwell's Island. As soon as sentence had been pronounced, Judge Davis gave notice that the court would this week proceed to consider "an occurrence which took place" at the beginning of the trial. This occurrence was an attempt on the part of the counsel for the defence to get Judge Davis out of the case, by a formal protest, on the ground of bias and prejudice, against the propriety of his presiding. Some short time since, in the same court, a lawyer by the name of Flan-

ders was suspended from practice, for a month, for contempt, by the General Term, and we sincerely hope that Judge Davis will now punish Mr. Graham and his associates in a way that they will remember. Mr. Graham has for years done his best to bring justice into contempt at every important criminal trial, by using foul language to the court, threatening his adversary with personal violence, or bursting into a flood of tears. The matter will come up on Saturday.

Speaker Blaine seems likely to be involved in considerable trouble about the Committees at the opening of Congress. A certain set of members—some good, and some bad—are anxious to have all those who were in any way implicated in the Crédit Mobilier affair excluded from the important places; and an equally strong party, including the Administration men, maintain that the Crédit Mobilier affair was not so dreadful after all, and that it would be a shame to disturb anybody on account of it. The fight is likely to make Mr. Blaine's position a very delicate one, but, as the Chicago *Tribune* points out, it is none of his business to punish members for connection with the Crédit Mobilier matter. That is the duty of the House, and the House has discharged it in its own way. It is now a little too late for virtuous indignation with regard to that particular sin. Whatever Congress may have to spare of that noble passion, should now be reserved for any little errors or lapses which may happen to leak out during the coming winter.

Insubordination has been spreading rapidly of late among the Republican newspapers, of which *Harper's Weekly* and the New York *Times* present the two most prominent examples. The latter, in particular, indulged in most disrespectful and thinly-veiled language with regard to Murphy, Bliss, and Davenport after the last election, and intimated that it would eat no more dirt of their providing, while *Harper's Weekly* has openly accused the President of complicity in the "back-pay steal." The contagion is now spreading to Congressmen. A flagrant case of insubordination on the part of one of these has just occurred in New Jersey, where Mr. William Walter Phelps declared, at a nominating convention where he was surrounded by the faithful, that "the party was not what it had been"; that he disapproved of the Crédit Mobilier business, the back-pay business, and the mode of filling custom-houses and consulates. He went further, and committed *scandalum magnatum* by finding fault with the character and standing of the persons whom the President gathers around him "in his hours of social relaxation." There was, perhaps, nothing new in this; but it was uttered in a new place, and, what was worse, was heartily applauded. The local organ of the party replied that Mr. Phelps must be crazy; that his speech was most "disheartening" and "disloyal"; that the President's companions proved him to be a man of the people, and not a heartless aristocrat like Mr. Phelps, whom it also called a "millionaire" and by other opprobrious epithets. If Mr. Phelps thinks that speeches of this sort are likely to promote "harmony and discipline," he is laboring under a sad mistake, and we recommend the organs to look after him as a dangerous person. "Reform within the party," we would remind him, is not likely to prove a lighter task in New Jersey than elsewhere.

The annual report of the Postmaster-General puts the revenues for the year (ending June 30) at $22,996,741, and the expenditures of all kinds, $29,084,945. For the year ending June 30, 1872, the ordinary revenues were $21,915,426, and the expenditures $26,658,192. In 1873 there was an increase of revenue over 1872 of $1,081,315, or 4.93 per cent., and an increase of expenditures of $2,426,753, or 9.10 per cent. A comparison of 1873 with 1871 shows an increase in revenues of $2,959,696, or 14.42 per cent., and an increase of expenditures of $4,694,841, or 19.24 per cent. The report recommends that the free-delivery system be provided for cities having a population of not less than 10,000. Money-order transactions show an increase of over $9,000,000, or 18.55 per cent. more than last year. During the first year of the postal-card experiment, 100,000,000 cards will have been used. The report finds the results of the abolition of franking very satisfactory, deprecates any attempt to revive the privilege, and urges the immediate establishment of a postal telegraph. The estimated expenditures for the year 1874 are $33,929,912; total estimated revenues, $29,293,549—leaving a deficiency to be appropriated out of the general Treasury of $4,636,383. This does not include $1,125,000 for mail service between San Francisco and Japan and China, and between the United States and Brazil, and between San Francisco and the Sandwich Islands. The chief officer of the Signal Service has also made his report. He gives the annual ratio of verifications of predictions as follows: New England, 81.50; Middle States, 81.17; South Atlantic, 79.92; Lower Lakes, 78.90; Eastern Gulf, 77.16; Ohio Valley, 76.42; Western Gulf, 74.40; Upper Lakes, 75.25; Northwest, 74.

The Report of the Comptroller of the Currency takes the form of an essay on "free banking" experiments and a defence of the national-bank system. This, he says, will become in time the best system in the world, and, in reality, banking is now perfectly "free," since "every individual or association of individuals throughout the country" can receive deposits, and discount paper, "and transact almost every kind of business pertaining to legitimate banking." He seems to be of the opinion that no two persons mean the same thing when they speak of "free banking." The Comptroller says that he is not at all in favor of an irredeemable currency, but thinks that the people of the country would make a great mistake if they went back to the state of affairs existing before the war, in which there were different rates of exchange for the different State banks, and points to the fact that during the recent panic no distinction was made by the people between legal-tender and national-bank notes. The Comptroller is also in favor of an elastic currency, and the whole report bears evident marks of "inspiration." What he means by an elastic currency he does not say, but apparently he has in mind the 3.65 convertible currency-bond plan, possibly combined with partial resumption in silver, though this last, by the way, has been modified by the Treasury—the creditors of the Government to the extent of fractional parts of a dollar only, receiving silver; those whose claims rise higher in amount than one dollar are now paid in paper.

The Executive Committee of the Pennsylvania Constitutional Convention have issued an address to the people of that State, and the proposed amendments have been published separately. They are in general very like the amendments proposed in other States during the last few years. Special legislation is done away with as far as possible. The term of the governor is hereafter made four years, without the privilege of re-election, and appointments are to be made by and with the advice and consent of the Senate, who, in considering them, are to sit with open doors; the vote is to be taken by yeas and nays and entered on the journal. The governor is authorized to veto any one or more items of an appropriation bill, while approving the rest.

> "This is to correct an abuse of great magnitude and long standing, by which appropriations introduced into the general bill providing for the expenses of the State, and which of themselves could not be sustained, must be approved, or leave the State without appropriation for its support."

The judiciary is to remain elective, but the Supreme Court judges are to be twenty-one years, and are not re-eligible—for practical purposes a life-tenure. All patronage is taken away from the courts. In Philadelphia, the office of alderman is abolished, and a number of elective magistrates (chosen by a qualified minority scheme) are substituted. There is also a provision for minority or "three-cornered" representation in the Boards of County Commissioners. All contested election cases are to be tried by the courts. The amendments provide for free railroad and telegraph laws, and against any unjust railroad discrimination or "fictitious increase of stock or indebtedness." The loaning of credit or holding of stock in corporations is forbidden to the State, as well as to cities, towns, boroughs, or counties.

International complications of a grave nature have arisen in

Chicago. The recent election in that city, our readers may not be aware, resulted in the triumph of what is called the "People's party," of which Mr. Hesing, editor of the Chicago *Staats-Zeitung*, is one of the principal leaders. Mr. Hesing celebrated his victory by raising over the office of the *Staats-Zeitung* the national emblem of Prussia, or Germany, it seems uncertain which. Fault being found with this offensive display by some of his contemporaries, on the ground that it indicated a plain desire on the part of the editor to subvert the liberties of the country which had welcomed him to her shores, and probably to bring the United States under the iron yoke of Bismarck, Mr. Hesing has published a reply, which the Chicago *Tribune* describes as a "very ingenious piece of sophistry." The *Staats-Zeitung* had referred, it seems, in justification, to the practice of carrying the Irish flag side by side with the American in processions; but, as the *Tribune* justly says, the signification of this practice has always been held to be not love but the detestation of foreign dominion. Mr. Hesing's flag, however, meant not, as he spuriously pretends, "equality of rights," but the victory of Germany in an American election. This is "an offence which has never been committed by any other nationality. It is the first time in the history of this city that a foreign flag has ever been displayed in connection with a political campaign—the first indication of foreign interference in home matters." The *Tribune* also asks Mr. Hesing to "inform us how long an American flag would be tolerated in Berlin or the smallest German village, *under similar circumstances*, and what would be the probable fate of the American who should proclaim his intention to repeat the display when he saw fit." To this request we have not yet seen Mr. Hesing's reply. Flaying, we believe, is the punishment usually inflicted by Bismarck for the first offence.

The Episcopal Church is a good deal agitated by the secession of Bishop Cummins, of Kentucky, who, while he was in New York attending the meetings of the Evangelical Alliance, followed the example of the Dean of Canterbury in taking the communion with Presbyterians. The criticism, to use a mild word, to which this has exposed him has precipitated a step which he had apparently, under the influence of horror of Ritualism even in its mildest form, contemplated for some time back. He has accordingly withdrawn from the Episcopal Church, but apparently does not consider that he has resigned his bishopric, as he says that "he transfers his work and office to another sphere of labor." What this means we cannot well tell, but it would appear to indicate an intention of setting up a church of his own. He is not a man of sufficient force, or learning, or eloquence to make his withdrawal of serious importance, or his new undertaking likely to be very successful, but of course the departure of a bishop is always a little startling. The controversy about the communion has raged at great length in the columns of the *Tribune*, and of course has raised incidentally the question of the superiority of episcopal ordination to that of other denominations, and a great many theologians have taken part in it.

The death of John P. Hale on the 19th instant found the public mind preoccupied with the Cuban imbroglio, and perhaps had little significance for the generation which has grown up since he was first elected to the House of Representatives, and promptly took sides against slavery and its extension through the annexation of Texas. It is easier to carry the imagination back a century than it is thirty years ago, and we are not likely to overestimate the moral courage displayed by Mr. Hale in allying himself with the anti-slavery minority whose presence was scarcely tolerated in the Capitol by the slaveholders. Elected by Democrats, and representing a Democratic State, he set a manly example of political independence which was afterwards rewarded by his promotion to the Senate, where manliness was still less a characteristic of the North than in the House. In maintaining his person and his self-respect intact amid the grim fanatics of the slaveholding party, he gave a remarkable demonstration of the power of humor over minds almost completely destitute of it. But it was precisely the kind of temper with which the Southerner was incapable of dealing. When in 1852 the Free-soil party made him its candidate for the Presidency, he received a merited compliment, but it was the nearest he was destined to come to that office. Like his colleagues in the anti-slavery struggle, he was assigned a subordinate post in the conduct of the Government during the rebellion, and for office contented himself with the mission to Spain, for which he was but ill fitted, and from which he returned with health permanently undermined. He passed away in the 67th year of his age.

Our Paris Correspondent describes what is thought in Paris of the Royalist overthow, and of the régime which has succeeded it, which is to all intents and purposes a monarchical régime. The Marshal is nominally "President of the French Republic" for a term of years, just as General Grant is President of the American Republic, but then General Grant holds office under a constitution which strictly defines his powers and duties, and is, for all branches of the Government, "the supreme law of the land." President MacMahon, on the other hand, holds office under nothing more authoritative than his own message to the Assembly, in which he calls for such a prolongation of his powers, and such an extension of them, as will enable him to discourage the factions, to secure obedience from his own agents, to restrain the excesses of the press, confine the municipalities to the exercise of their legal rights, and, in short, provide France with "a strong and durable executive." The experiment of such a Government is certainly a dangerous one, but it is one to which France returns continually after vain attempts at something better. The hopeful feature in the present case is that she has got back this time peacefully, and under the forms of law, and it is, therefore, reasonable to hope that a durable and satisfactory constitution may grow out of it.

There is nothing very new in the condition of things in Spain; but the Carlists appear to be gathering fresh strength, and the fact that they are moving in considerable force towards Castile and Aragon goes far to confirm the report of a victory gained by them over Morionos last week. The Cartagena insurgents are said to be much divided and demoralized, and the city appears to be now largely in the hands of fifteen hundred liberated convicts, headed by Contreras. They are every day reported to be going to surrender, and the inactivity of the besieging force supports the belief that the Government is negotiating or bribing to that end. From Madrid we have little news; but Castelar's difficulties, which were increasing before, have undoubtedly been aggravated by the Cuban affair, and there is a rumor afloat at this writing that he has been displaced to make way for Serrano. Whether this be now true or not, some such result cannot be very far distant, and was foreshadowed in many minds by the "adhesion" given him a few weeks ago by the leading Monarchists and Radicals. This adhesion probably meant the return of these gentlemen to "politics," or, in other words, to their old game of intrigue and counter-intrigue, in which Castelar is sure to suffer.

The Italian press has begun again its periodical discussion of emigration, the alarmist portion urging a return to Government interference like that attempted a few years ago, when passports were denied those who seemed unlikely to support themselves in their new homes, and who might therefore be expected to be sent back at their country's expense. Experience has shown, however, that emigration affords a normal relief to the country, ridding it of many turbulent and vicious elements, and returning to it prosperous and law-abiding citizens with fortunes made abroad; for the Italian emigrant is strongly attached to home, and, as the colony on the Plate shows in a remarkable degree, aims generally at ending his days on his native soil. The sums of money sent over to parents and kinsfolk form a large contribution to the wealth of the kingdom. The Ligurians, for instance, who are found in considerable numbers, chiefly as fishermen, on our Pacific coast, send annually from all parts of America hundreds of thousands of dollars through the bankers of Genoa, and the Italian postal-order department paid last year more than twelve hundred thousand dollars on remittances from abroad.

WHAT DOES THE FLAG PROTECT?

PURSUING the course of argument which was commenced in our article of last week, we now propose to state those doctrines and positive rules of the international law which regulate the use of the high seas, and especially those rules which, treating the flag as the symbol of national sovereignty and independence, accord to it a protection of the vessel over which it is raised. The application to the case of the *Virginius* will be evident. As the result of long and fierce wars between powerful maritime countries, it is now an accepted principle—one of the doctrines which lie at the foundation of modern international law—that the ocean, is the common highway of the world. Belonging to no power, it can be used by all alike; each has upon it the same rights as all the others; each may navigate it unmolested by the others, except when war introduces some modifications of these common rights which affect both the combatants themselves and also the other nations which, not taking a direct part in the contest, are called neutrals. The jurisdiction of every independent and sovereign state—that is, its power over persons and things—is, in respect of the place of its exercise, twofold. This jurisdiction may be exercised over all persons and things within the national territory; it may be exercised over the persons and things of its own citizens upon the high seas. The vessels of a nation, whether public men-of-war or private ships of commerce, are by a certain fiction spoken of as parts of the national territory. As long as these vessels remain upon the open sea, this fiction represents with sufficient accuracy the exact truth, and on it the only limit to the actual power of the nation is a physical one. In other words—and we merely state the same proposition in different terms—the private commercial vessels of a nation are always under the operation of the country's municipal law while upon the high seas, and are, therefore, liable to be stopped, searched, and seized in any manner and by any instrument prescribed by that law—for example, by a national man-of-war. The same convenient fiction which regards a ship on the ocean as a detached portion of the territory of the country to which it belongs, carries the local law and jurisdiction of that country after the vessel, wherever found upon the high seas, and thus extends such law and jurisdiction, in respect to these movable objects, to all parts of the world. This holds good, whatever may be the character, business, designs, motives, or intentions of the owners of these national vessels. If certain subjects of a sovereign, independent state revolt, and any condition of hostilities arises, the original jurisdiction of that state over the ships, warlike or commercial, belonging to its insurgent subjects on the high seas continues through all possible phases of the contest, until the parent government has itself recognized the independence of its former subjects. The acts of other nations do not and cannot affect this original jurisdiction; recognition of belligerency, recognition of independence even, by other states does not sever the tie which joined the parent nation and all its people. Such recognition simply affects the relations subsisting between the two hostile communities and the neutral countries granting the recognition.

The number of independent, sovereign states which form at any time the whole family of civilized peoples acknowledging the modern international law is known and established by mutual agreement as a fact, and no new member can be received without the consent of the others, which consent is expressed in the act of recognition. This existing status of independent nations, and this possibility of independent jurisdiction over the high seas, running with and exercised upon the vessels of war or of commerce, has made it necessary that the nationality of every vessel should be certified to the world in some manner, so that the sovereignty and jurisdiction under which she sails should be respected. The ship's papers or commission, officially authenticated at home, and the flag are the means of certification. A private unarmed ship, without such official papers from some recognized country, and not bearing the flag of such a country, is without the protection of the international law, and would not be suffered to engage in commerce; she would be condemned and subjected to forfeiture by the municipal law of the first port which she entered. What is the condition of an armed vessel or transport carrying no commission and flag from a government properly recognized? Technically, she is a pirate. In former times an actual pirate was treated as an enemy of mankind, and was liable to be captured on the ocean by any power, while the crew were justiciable in any country. The law of nations regards other armed vessels as pirates who differ far from the freebooters to whom the name is popularly given; thus, a privateer bearing commissions from two different governments is a pirate. At the present day, however, it is certain that such a privateer would not be treated as a pirate by any nations whose commerce she had not molested. In the same manner, while an armed man-of-war or a transport having a commission and flag of a people which had received no recognition—that is, of a rebellious community to which the right of belligerency had not been accorded—would technically be a pirate by the international law, she would not be practically treated as such by the countries not taking a part in the contest, but might be and would be piratical as respects the parent state against which she was carrying on hostilities. Hence arises the overwhelming necessity to a revolted community of being recognized in some manner that shall give it a *quasi* national standing. It is plain, therefore, that prior to the lowest grade of recognition—that of belligerency—a revolted province cannot carry on maritime warfare against the parent government, cannot resort to the use of armed ships or transports sailing under its own flag, without rendering these vessels technically piratical, and without subjecting the officers and crews technically to the penalties of piracy. Unless the insurgents are powerful in comparison with their enemies, and have extensive maritime resources—in which case they would undoubtedly be at once recognized as belligerents—they must of necessity, as was stated in our former article, pursue their maritime warfare under the cover of some other flag—some flag belonging to a sovereign nation, which must, of course, be a mere spectator of the conflict. That this use would be fraudulent, would be an outrage upon the neutral, and might subject it to severe reclamations from the parent, state, was the very doctrine maintained by the United States in the Alabama controversy, and triumphantly enforced in the Treaty of Washington and by the Geneva Arbitration.

The question then occurs: Does this unlawful and fraudulent use, by an unrecognized insurgent community, of another flag and other means of ordinarily certifying a national commercial ownership and character, cut off the right of the parent government to capture the vessel on the high seas—a right which would clearly have existed if she were sailing under the flag adopted by the rebels themselves? The answer would seem to be plain, and the international law is certainly in need of amendment if it permits such a subterfuge, such a fraud upon the sovereignty and dignity of a state, to be used with success. All nations are properly jealous of any violence or indignity offered to their flag, because the flag is an emblem of the independence and sovereignty which constitute the nation. But this independence and sovereignty, much more than the mere symbol of them, exist solely to enforce the jurisdiction of the nation and to protect its citizens and property. This jurisdiction, outside the territory on the high seas, extends only to its citizens and property, and its flag cannot, by its own municipal law or by the international law, be legitimately used to bring vessels and persons not belonging to it under the cover of its protection. The case of ordinary piracy is plain; no doubt has ever been suggested in reference to it. If an actual pirate should in some manner be provided with an United States register and other ship's papers, and should carry the United States flag, no one pretends that the United States would or could object to its capture by a British or French man-of-war. A case is thus established in which apparent regular national ownership and the national flag do not hinder the proceedings of other nations

which have jurisdiction over the subject-matter. The rule of this case extends to others which fall within the same principle. As we have shown, the armed or warlike vessel of an insurgent community, having no recognized status of any kind, and of course no flag, is technically a pirate by the international law; and although in modern times the indifferent neutral states of the world have practically abandoned their jurisdiction over her, the parent state retains such jurisdiction as fully and as rightfully as the jurisdiction of every nation over the pirate according to the popular acceptation of the word. Between these two communities—that is, the parent state and the rebels—the vessel is a true, legal pirate, and the foreign flag is no more protection than a similar flag flying over one of the buccaneers which once infested the Spanish main.

But it has been said that the United States, in the famous controversy with Great Britain respecting "the right of search," maintained the doctrine that its flag was under all circumstances an absolute protection, that it absolutely repelled the right of search in time of peace, and that the same rule must now prevail, since a state of war between Spain and the Cubans does not exist. It is well for us to remember that the position of the United States in that controversy was assumed by a Government which was carried on in the interests of slaveholders and slaveholding. The Southern politicians who then controlled the Government were determined to do as little as possible to interfere with the slave-trade; and because they could not take open ground in the face of the world in favor of the hellish traffic, they placed their resistance to the requests of Great Britain upon the sanctity of the American flag. A very large part of the slave-trade was carried on under our flag, and the right of search demanded by the British Government was then refused. In 1862, the United States receded from this position, and entered into a treaty whereby the right was conceded to British cruisers on the African coast. It is surely remarkable that the old slaveholding pretensions should now be cited as precedents to be followed by a Republican Administration. But even in that controversy the United States did not assume the ground that its flag was absolutely and under all circumstances inviolable on the high seas. While some passages or sentences from the long correspondence may, when separated from their context, support such a view, the most solemn and authoritative acts of the Government fall far short of it. What was the exact point in dispute? If a ship carrying our flag was boarded and discovered to be a slaver, and therefore captured, did the United States object and treat the seizure as a national outrage? By no means. The mere fact of being a slaver showed that the assumption of the flag was fraudulent and in itself an outrage. What the British Government demanded and our own refused was, that if the vessel proved to be innocent, the search should still be excused. In other words, the United States declared that *its* ships, carrying its flag, should not be searched to ascertain whether they were slavers. A British cruiser searched at its peril, but discovery of the slaver character at once justified the capture. After a long negotiation, a treaty was made in 1842, by which the United States stipulated to maintain a squadron in the African waters. The instructions given, in consequence of this treaty, to its naval commanders by our Government, show more clearly than any other official document the exact position of the United States upon this particular point. From these instructions we take the following extracts: "The United States does not recognize in any nation the right of visiting and detaining the merchant ships of American citizens." The document then states that pirates according to the international law may be boarded and searched, but that this rule does not extend to pirates declared to be such by the municipal law only, in which class are slavers. It proceeds: "The right, therefore, which exists, by the unanimous consent of nations, in respect to ships suspected of acts of piracy, does not extend to those employed in the slave-trade. As to the latter, there exists no right of visit or search which can affect American vessels, except that which can be exercised by our own men-of-war. But the privilege which the United States asserts, of not permitting their merchant vessels to be visited under any pretext (except for suspicion of piracy) by the cruisers of other nations, *presupposes that the vessel visited is really American.* The manner of ascertaining this fact is the only question which presents any difficulty. The flag which a vessel carries is *prima-facie* proof of her nationality, but not conclusive proof. The flag is an emblem; *it loses its true character when it is carried by a vessel which has no right to be covered by it. . . . The United States certainly do not pretend that the act of raising the American flag ought to confer a privilege upon those who have no right to be covered by it.* Such a pretence would expose their flag to be degraded and dishonored, since it could then be made to protect acts of piracy or other such atrocious crimes; but they wish that their citizens who lawfully sail under it should enjoy all the protection which it carries with it" (Ortolan, 'Diplomatie de la Mer,' vol. i., pp. 242, 243, 4th ed.) These private instructions, proceeding from the Government to its own subordinates, disclose its position far more accurately than the public, and sometimes heated, diplomatic correspondence. The doctrine here announced, under circumstances most favorable to the claim of inviolability in the flag, decides the questions involved in the capture of the *Virginius*, and furnishes an authoritative precedent which the Administration can consistently follow. This doctrine is, that the flag protects American vessels, but does not protect those owned and controlled by alien communities who fraudulently use it in warlike operations against powers with which the country is at peace.

There are many analogies between the *Virginius* and the Confederate cruisers which gave rise to the *Alabama* controversy. Though not technically armed, she was in fact a transport, and as such was as truly warlike at the time as though she carried guns for attack. The broad underlying principle set forth in the Treaty of Washington and affirmed by the Geneva Arbitration clearly applies to her case. The neutral burdens which we have with so great *éclat* assumed are doubtless heavy; but it would be monstrous to see them thrown off in the very first instance where their pressure begins to be felt.

THE OVERTHROW OF TWEED.

THE transfer of Tweed to Blackwell's Island as a convict is, since the deposition of the corrupt judges, the most important and valuable result of the Reform movement of 1871, and the evidence by which it was brought about is perhaps one of the most curious and interesting bits of demonstration in the history of criminal jurisprudence. One of the papers has called his conviction "a vindication of democracy"; but it is to be hoped that democracy will not often have to be vindicated in any such way. Indeed, the fact that any democrat should feel disposed to boast of the Tweed trial, is a striking illustration of the modesty of the attitude to which democracy is in our day reduced, and of the contrast which this attitude offers to the fierce exultation and hopefulness with which the friends of popular government began the present century. That the most powerful official of a democratic city should enter into a conspiracy with the mayor and treasurer to rob the treasury, and should do so to the extent of many millions, with the aid and connivance of a band of vulgar tools employed by himself, and should have used the funds to corrupt the State legislature into abject submission to his will, and to place his creatures on the judicial bench, and should in the very midst of an exposure of his villany have secured his re-election to the State Senate, is something for which the enthusiasts of seventy years ago were certainly not prepared. At that time, it was only royal favorites and dissolute aristocrats who were supposed to be capable of Tweed's crimes. Nobody dreamed that the people's money would go to furnish orgies for chairmakers, plasterers, and plumbers, or that the revelries of the Palais Royal would be reproduced in simple brown-stone mansions of a city in which no native had ever worn a title. That this should have come to pass, and that when a court was to be organized to try the head and front of all this wickedness it should have been

ound necessary to examine minutely the character, antecedents, and business and social relations of the 900 picked men placed on the jury-list, and to watch night and day with detectives those who were sworn, to prevent their being bribed into a betrayal of justice, are facts by which many an ardent reformer will be sobered. But then, it is also true that many a sober and despondent reformer will be cheered and encouraged by the reflection that, when once a people has grown used to constitutional reform and to peaceful agitation, there is nothing which may not with time and patience be expected of them. The lights are out in the Tweed "mansion"; the stable is vacant, the garden lies waste, and the punch-bowl is empty; and the henchmen are trying many shifts to escape the police or the almshouse, and the great chief himself lies in jail for the rest of his life among common thieves and vagabonds. It was a slow process which brought this about, but no life was lost in it, no legal habit was broken up, no wild hopes were roused, and no defence of personal liberty or of property was swept away by it. Ground which is won for good government in this way is well and surely won, and the victory is certainly worth waiting for. Other Tweeds may arise in this city—indeed, we do not well see why they should not—but the memory of the way in which the original "Boss" was disposed of will itself make their career short and their overthrow and punishment easy.

When we say that other Tweeds may arise, we mean that the reform which has overthrown Tweed is not thorough or radical. The causes which have produced him and his followers are still active, and not in the Democratic party only, but in the Republican party. We do not now refer to the presence in this city of a huge body of ignorant and corrupt voters. We refer to the doctrines with regard to the relations of the party in power to the public revenue which are still held and avowed by nearly all influential politicians on both sides. It is in these doctrines that the seeds of the Tweeds and Connollys and Halls and Sweenys are to be found; the corrupt and ignorant constituencies simply furnish the fruitful soil on which they grow. It will never do, as thoughtful men begin to recognize every day more and more, to treat these rascals as isolated phenomena, without other cause or antecedents than depraved natures. They are the natural product of certain political opinions and habits. As we now look back a little, few of us can avoid wondering that the maxim, that the spoils belong to the victors, did not produce Tweed sooner. As soon as that maxim was embodied in practical politics, his appearance was a mere question of time. He appeared in New York sooner than in Boston or Philadelphia, partly because it is a bigger city, and partly because the heterogeneous composition of the population makes public opinion and public spirit weaker in it. But when once we admit that party politicians are entitled to use the public money, either directly or indirectly, to reward party services, the way is prepared for Tweeds everywhere. They will in some places be of a milder type than others, but they will appear in all. From creating offices for party "workers," or putting them *as such* in offices already created, or giving them fat jobs like collectorships and public warehouses in which they can enrich themselves in a few years, and then levying contributions on them for the working of the party machinery, the step to the crimes of which Tweed was the other day convicted is but a short one.

Tweed, for instance, has been condemned for having given contracts for municipal work to his own confederates at extravagant prices. But then, the principle on which he did this has been long in use in the Republican party. Contractors have long been treated by it, not as persons with whom the Government dealt, but as beneficiaries who were expected to help to keep a particular party in power. They were levied on regularly during the war, and are still, for campaign expenses. Tweed was simply courageous enough to make the contracts very fat, and the contributions very heavy. What demand, too, let us ask, did he make on Garvey or Ingersoll which differed in principle from the demand made by the Republican State Committee on General Barlow when he was United States Marshal, that he should contribute a certain percentage, not on his salary, which was only $6,000, but on his supposed stealings, which were $50,000? How did Tweed's exactions differ from this except in degree? The twenty-four per cent. which has been traced into his pocket is doubtless very shocking, but then it is not quite so shocking when we remember that Tweed exercised towards his party in this city and State the functions of a State Committee. He was an autocratic "manager." It was he who looked after the elections and manipulated the legislature, and his followers supposed, and rightly supposed, that a large proportion of his appropriations went in this way, and they accordingly winked at it, as we wink at Hopper's levy on the Post-office clerks, or Jayne's descents on the merchants, or as we would have winked at Barlow's contribution from his thefts, had he been guilty of any. Tweed was a bold, bad, able man, who had far higher ambition, far greater skill, and far better materials than the Murphys and Davenports; but his political morality was essentially the same as theirs. He pushed further ahead than any one else on a road on which thousands of wretched little politicians who pass as respectable, and are now busy rolling their eyes over his misdeeds, are trotting along as fast as their puny legs can carry them. He played with great recklessness the very game which carries other men, not very much better than he, to the senatorships and chief-justiceships and governorships, and gives them the *petites entrées* at the White House. The Boss was the result, and the legitimate result, of a system which, as long as we uphold it, will give us in every generation an increasing number, if not of matches for him, at least of imitators of him. The breed is one which can adapt itself to all latitudes. It is one thing in New England, another thing in New York, and another in Pennsylvania; but it is in all three the faithful servant of the Devil.

AN "ELASTIC" CURRENCY.

IF that scheme of making the currency "elastic" by issuing more greenbacks, and then more bonds to absorb the greenbacks whenever the supply is too great, has still a serious lodgment in the brains of honest men, we invite them once more, before Congress meets, to "think it out" resolutely, and see, not in the light of their own wishes or fancies, but in the light of human experience, what it will come to in practice. Some journals, the *Evening Post* among the number, have tried to discredit the plan by showing the way in which speculators may turn it to account by "locking up" money under it; and this is a point which deserves serious attention, but no argument drawn simply from the probability of its abuse by knavish men will block it. If it be, as its supporters pretend, a great financial discovery, it is no more likely that they will be induced to abandon it by showing them that somebody may make it the instrument of evil designs, than it is that they would be induced to abandon issues of bank-bills by showing that they furnish extraordinary temptations to forgers. Our objection to it is the fatal one, that it will not answer its purpose, and that its complete frustration will be brought about at the very outset, not by the machinations of Wall-Street operators, but by the working of the ordinary laws of trade; and it is this objection which most needs urging.

The propounders of the scheme have in their heads a close connection between the new bonds and the new greenbacks, and they fancy, with the usual enthusiasm of inventors, that they can transfer this connection to the heads of the public. Now, this is the very delusion which has been at the bottom of all the attempts of the last five hundred years to give currency a fictitious value. In every case of paper inflation, or coin-clipping, or adulterating, the legislator has fondly but vainly hoped that the public would enter into his ideas, and help him to carry out his policy; that it would take coin without reference to its value as bullion, or fix prices in paper without reference to the quantity afloat. The grand fundamental truth of financial science, however, which it is so difficult to hammer into the heads of currency-tinkers, is that men of every community conduct their business solely with reference to their immediate personal interests, and will not sacrifice their personal interests in the ordinary course of trade to carry out any

legislator's policy. Therefore, if Congress issues say one hundred millions more greenbacks this winter, they would produce just the same effect on prices as if no bonds were issued to be exchanged for them. The increase of the volume of the currency will be felt in all branches of business at once; that is, everybody will find it easier to get money than he did before, and all vendors of commodities will do what they have done under such circumstances—what they have done ever since the days of Tubal Cain—put up their prices. The butcher, or baker, or ironmonger, or clothier will not trouble himself with the reflection that people who have too much money can exchange it for $3\frac{65}{100}$ bonds; indeed, he will laugh when you mention it to him. He will say, on the contrary, that his business is to take care of himself; that he wants none of the bonds, and is occupied in getting the current rate of profit on his capital. Accordingly, as soon as you have got the proposed increase of paper fairly afloat, you will find that it has disappeared into prices without leaving a ripple on the surface, and that the business of the country bears just the same relation to the volume of the currency that it had before; that, in short, as one is to two, so is two to four; that it will be as hard to move the crops in the fall as it is now; that the stringency every winter will be as great as it is now; that five hundred millions of greenbacks will do just the work that four hundred millions did, and no more; and that your $3\frac{65}{100}$ bonds will bear in the public eye the appearance not of a place to put surplus currency, for there will not be any, but that of a not very attractive investment. They will, in short, constitute an offer of good security at a low rate of interest, and be much less tempting than the new five per cent. loan, and bear just the same relation to the money markets. The only thing we can think of as in the least likely to make the proposed scheme produce the results expected of it—and we by no means warrant this—would be the issue of a proclamation by the President, countersigned by Secretary Richardson, to this effect:

"*Whereas*, the present Congress has authorized and required the Secretary of the Treasury to issue $100,000,000 of United States legal-tender notes, and in order to prevent such issue having the character or results of an inflation of the currency, and in order to give to the currency the elasticity in which recent events have shown it to be wanting, has also authorized and required him to issue United States bonds, bearing interest at the rate of $3\frac{65}{100}$ per annum, into which the said legal-tender notes or any other may be at all times converted at par, with accrued interest, and which may also be at all times converted into legal-tender notes at the Treasury on like terms—

"Now I, Ulysses S. Grant, President of the United States, do therefore solemnly enjoin all trades, merchants, farmers, manufacturers, bankers, and all citizens of whatever calling or occupation, not to allow the said issue of greenbacks to affect the price of their commodities or labor in any degree whatsoever, but to remember that the object of such issue is to give elasticity to the national currency, and enable it to be expanded for the moving of the crops and other exigencies; and that, when no longer needed for such purposes, it is to be promptly reconverted into the bonds aforesaid, and not used for speculation of any description whatsoever, or to increase the value of any article of merchandise. Persons who find they have more of it on their hands than they need for their transactions are, therefore, warned that it is their duty to bring it to the Treasury, and lend it to the Government at $3\frac{65}{100}$ per cent. per annum."

If, as there now appears reason to believe, the various schemes of inflation which are on foot should be buried in the House under their own weight and multiplicity, or lost in a cloud of talk, or should, as is more likely, be killed in the Senate even if they pass the House, those senators and representatives who know what the conditions of sound national finance are will, it is to be hoped, not rest content with defeating attempts to make things worse than they are, but will vigorously push some measure for making them better. We shall never get out of our present slough without legislation energetically urged by some man, or set of men, in Congress having sufficient knowledge of the subject and sufficient hold on the ear of the country to secure popular confidence and support, because our whole financial system—currency, banking, and all—is the creature of legislation. There is nothing natural about it, and therefore the cure of whatever evils there are in it cannot be left to nature. The notion that we can drift into specie payments, to which we are sorry to see so respectable an authority as *Harper's Weekly* give countenance, is a most unfortunate one, and may at this juncture do much mischief. Even if the working of exchange should, in the present state of our trade, bring greenbacks to par in gold, gold could not supplant paper as long as nobody was bound to redeem paper in gold; or, in other words, to make room for the gold by withdrawing paper. It could only come into circulation as an addition to the paper; or, in other words, by a process of inflation, and it could not stay there very long, because the first turn in exchange would cause it to be sent abroad again. Nevertheless, as we have once before pointed out, if greenbacks were at par, the process of resumption would be all the easier if the Government or the banks set about it. But somebody must set about it, and it is plainly the duty of the Government to do so, whether we have a war with Spain or not. It would be infinitely discreditable to pay the expenses of a contest with a power from a military point of view so contemptible as she is, by a fresh adulteration of the currency. The cost of the war, if war we have, should be met in a manly and rational way, by borrowing money, and the reform of our circulating medium proceed all the same.

What that reform should be seems to be clear enough. We ought to resume; and if we cannot resume all at once, we ought, like private debtors, to resume by degrees. How this should be done has, we think, been more clearly indicated in a plan proposed by Mr. J. S. Ropes, the President of the Boston Chamber of Commerce, than in any other we have seen. He proposes that, as the absence of any fixed date of payment from our legal tenders has made it possible to refuse payment of them without seeming guilty of repudiation, and as it would probably be impossible to undertake to redeem them all on presentation, a new issue should be substituted for them by sales to the highest bidder, and this new issue should be payable in gold, at the Treasury, on a day certain, and in sums of say thirty or sixty million dollars a year. If this policy had been adopted at the close of the war, we should be on a specie basis now. If adopted now, after a reasonable time for preparation, we should get back to a specie basis in five or six years, even if we had to redeem every dollar of outstanding paper. But nobody supposes that this would be necessary, or that the demand for gold would not cease before a hundred millions had been paid out. The solemn adoption of such a policy by Congress would, however, give us one thing *immediately* which would be fully as valuable as gold, and that is, certainty as to the future. Nothing weighs at this moment more disastrously on trade and commerce and manufactures than the doubt which prevails as to the future value of the circulating medium. Congress cannot remove this doubt by promising not to issue any more paper money, because restrictions of this kind by one Congress can be always set aside by another under very slight pressure from excited public opinion. The one thing which no Congress will dare to do is to direct the Secretary of the Treasury to refuse payment of a reasonable number of United States notes falling due on a certain day.

A LESSON FROM THE TWEED VERDICT.

THE almost unhoped for verdict in the case of Tweed and, no less, the ominous preliminary picket-firing which was heard during the impanelling of the jury, will serve perhaps to bring the attention of the public to the defects of our present system of trial by jury. In a former article (*Nation*, No. 417), we have shown that the jury system is interwoven with and forms an integral part of our general system of self-government, and that it would be as wild to give up a representative government because of the incompetency and corruption of an almost controlling portion of our modern legislators, as to give up trial by jury because there has been a moral decline in the character and verdicts of our modern jurymen. But we were careful to say that the jury system is human, that it has imperfections, and that its excellence depends upon the same condition which is inseparable from the excellence of free government—the voluntary sacrifices of intelligent citizens in the scrupulous discharge of the duties of citizenship. It is indispensable for a good jury system that there be given in lesser or greater proportion good jurymen. There is no magic in the system which can change the incompetent into the competent, or the depraved into the upright; and, like other parts of government, to be administered well, it must be administered by those who will administer it conscientiously. There are constantly coming before our

courts different kinds and classes of cases, some of which unquestionably require better jurymen than others. A very large proportion of cases involve no public interest and but small pecuniary amounts. The evidence in them rarely is conflicting, and the task of deducing the facts is so easy as to be little more than a matter of form. In such cases, there is no temptation in the way of corruption, and no great amount of intelligence required to do substantial justice. In plain words, very ordinary men will make passably good jurors for very ordinary cases. When we reach another class of cases, however, we find forensic ability, complicated facts, conflicting evidence, and hence that there is required on the part of the jurors unconfused memory, trained attention, and considerable intellectual power of analysis. A third class of cases will add to these difficulties great pecuniary interests, or, if they be criminal cases, popular prejudice, personal sympathy, improper influences, and, finally, the chance of direct gross corruption. In all jury cases, civil and criminal, the danger from corruption is to be apprehended as coming always from one side, and it seems indeed the weakness of the system that the defendant, by controlling one of twelve men, can bar a verdict. We wonder that the annals of courts do not furnish innumerable suspicious cases of this character. But in point of fact, we believe they are very rare. The failure to agree will be found very seldom to rest with one man. Probably, when a case is tolerably clear, the moral effect of being locked up with eleven decided men to whom he cannot render a reason for his solitary obstinacy which their knowledge of the facts will not enable them to knock away, accompanied by a healthy refusal on the part of the court to discharge the jury until they do agree, really frightens such a man out of a previous intent to do wrong.

The chief evil in the operation of the system seems to be where jurors stand eight for conviction and four for acquittal, and stand out obstinately if not honestly; where the minority are not directly actuated by corrupt motives, but are acting in a kind of blind honesty under the dictation of their prejudices, or ignorances, or sympathies, or passions. In other words, the evil is that of incompetent jurors. Our system has also hitherto been framed (as completely as though it were its purpose) to exclude from the jury-box in important criminal cases those citizens who intellectually and morally are best fitted to be there, and to consign this not least important part of the administration of government to those who are least fitted to perform its duties. The wonder should not be that the system works badly with such conditions imposed upon it, but that it works so well, or, indeed, that it works at all.

When we come to consider how it shall be improved, and, particularly, how it shall be improved in material, we are met with the fact that its duties are too onerous, especially in great commercial centres, where good jurymen in great cases are most of all needed. It is not merely that a merchant may be summoned occasionally in a Tichborne case, but that he is very sure to be summoned too often. An occasional draft of this kind, especially when it comes fairly, so that all other persons in like conditions of life have to share it equally, will be endured with resignation if not with cheerfulness; but when such drafts are frequent, and especially when they are unfairly made, so that a man is summoned four times a year while the man on the opposite side of the street is not summoned oftener than once in two years, the moral obligation of serving is laid aside, and men resort to all the tricks of evasion which they believe are practised by others. In England as well as here, the frequency of jury duty has been the chief complaint by respectable citizens, and all the attempts at amendment embraced in the bill of Sir John Coleridge were more or less connected with this same evil of too frequent service. It was on that account that Sir John Coleridge proposed to abandon the immemorial number of twelve, and it was to facilitate the finding of verdicts—in other words, to lessen the repetition of trials—that it was proposed to give up the equally old usage of unanimity. In our former article, we pointed out that the trouble with verdicts in these days is not that too much conclusiveness is attached to them, but too little; and that the common mind will not for a long time to come attach as much importance to the verdict of a majority of nine men as to the unanimity of twelve. Since then, all of the judges have united in a request that the old number be retained. The English judges of late years have certainly shown themselves ready to co-operate in legal reforms, and their unanimous recommendation must be taken as the opinion of thoroughly experienced men. We may also cite in confirmation of a former assertion the opinion expressed by one of the officers of the Court of Queen's Bench, after a long lifetime of observation, that the verdicts of juries are generally right, and that the extraordinary and suspicious verdicts are really very rare exceptions to the general rule of honesty and good sense.

It is undeniable that there are different classes or grades of cases coming before our courts. Some of these do not require juries at all. For them a commission of experts, a board of engineers, a committee of scientific persons, a few skilled mechanics, would certainly be better than any jury miscellaneously chosen, though composed of most intelligent men. A second class of cases requires jurors rather as a matter of established legal form than because there is any real dispute of fact. There are cases where a citizen may be required to serve in the jury-box for a number of days, and, at the end, be told what verdict he is to find by the court. We now send cases involving the examination of a long account to a referee, because they are manifestly cases which twelve men cannot collectively sit down and unravel; but there are many analogous cases retained for juries which might very well be sent to special commissions, or indeed be turned over at the outset to special tribunals. An ordinary jury in a complicated patent case, listening to the jargon of the experts, and looking with confused eyes at tables covered with intricate models, is certainly not a rational application of the right of trial by jury.

But the great mass of our litigated cases is made up of the important and the unimportant, the difficult and the simple. For these two grades of cases our present system furnishes precisely the same material for the jury-box. We make no discrimination in our legal theory where there is the widest difference in the facts to be dealt with. The most intelligent citizen will be assigned to deal with a paltry suit on a promissory note, while a man of questionable morals and character, and of unquestionable ignorance and prejudice, with just enough *legal* respectability to be on the jury-list, will be allowed to decide a great will case, involving points of sanity, mental capacity, undue influence, or of decreeing the fate of some other human being who has the good or bad fortune to have this juror as a part of the tribunal which tries him. In England there has long been a division of the jury material known as special and common juries. In civil suits there are some rules for obtaining a special jury, but, substantially, any man can have one who is willing to pay for it. In other words, it is chiefly a matter of cost. In criminal cases, special juries are ordered, we believe, in the discretion of the court; and it is worthy of remark that the pressure of jury duty, there as here, falls upon that class who furnish the most valuable material.

In our own country we have never grappled with this difficulty of having two classes of jurors for different grades of cases. In our rural districts it would be impossible to divide society into two such classes. There are diversities, of course, to be found in individual character, but taking the farmers of one of our rural districts, who furnish the jury material to be found at their county court-houses, there are no distinctions which the law can lay hold of, and, indeed, we can say of them generally that they are respectable men, and form, in the great majority of cases, intelligent jurors. And in the rural districts involved and complicated suits are comparatively rare. The average juryman is much above the average juryman of the great cities, while the grade of cases which he determines is much below many that monthly come before the city juryman. It is in the towns where discrimination is needed, and where discrimination is possible. The English system takes certain trades and professions, such as merchants, bankers, etc., and designates them for special juries. Would not such a distinction be practicable where we have trades and professions forming the mass of society, as in our great towns? It is possible, and indeed probable, that were the attempt to be made it would awaken the hue-and-cry of the professional politicians, and that they would resent the attempt to obtain intelligent jurors for complicated cases as something even worse than taking away from the people the right to elect their own judges. But it is more than probable that no reform can be devised for any evil which will not be sure of their opposition, and, as affairs now stand, we can hardly afford to abandon both the bench and the jury-box to the worst part of society.

The conduct of the jury in the case of Tweed—their patience, deliberation, reticence, and their prompt, decisive verdict, rendered so soon as the intricacies of the evidence were mastered—shows what the jury system is when decently administered. For this most extraordinary jury of upright, conscientious citizens we are chiefly indebted to Judge Davis, who, in a rough-handed way, struck down all attempts at adulteration, and virtually compelled a selection from the respectable part of the community. But we all know that there are very few judges determined enough to carry such a point against a powerful array of indefatigable counsel; and the process of weeding out men who should never have been called in such a case is difficult and uncertain. Cannot the Bar Association now direct its experience to these two objects; first, the lessening of jury duty; second, a classification of city jurors which shall secure the competent for those cases where they are most needed?

THE MONARCHIST PROGRAMME IN FRANCE.

PARIS, November 6.

THE Assembly meets to-day at Versailles, for the first time after a long absence, and under the weight of the most extraordinary events. It finds itself somewhat in the condition of a bride who is all ready to go to the

altar, and who hears that the bridegroom has disappeared. The Comte de Chambord refuses to go to the altar of a constitutional monarchy and to be wedded to his people. He remains on a sort of Sinai, in a cloud, in the folds of his white flag. It would be difficult to describe the feelings which have been produced by the publication of his last letter. All his ancient manifestoes had been forgotten; the country was informed that a negotiation had been opened between him and some representatives of the monarchical parties. The last negotiator, a man known for his honesty and his piety, had come back in a state of great exultation. He had found the Comte de Chambord ready to accept the position of a constitutional sovereign, to allow the Chamber to annex to the proclamation of the monarchy a bill of rights, which was to be the foundation of the future constitutional laws. On the question of the flag, it was understood that the Count, as a Bourbon Prince, was still attached to the white flag, but that as a constitutional king he would claim no right to alter the flag, except with the consent of the Chamber; and it was generally understood that some fleur-de-lis would simply be spread over the white band of the tricolor. Everything was *couleur de rose*. The Government, which had during the first period of the fusion maintained a neutral attitude, was finally carried away by the monarchical current. Who could refuse to accept this unexpected chance of reconciling the best elements of the past and the best elements of present France? The Republicans kept up a desultory warfare against the fusion; the Conservative Republicans showed a little incredulity—they demanded some document, some treaty in due form, signed by the Comte de Chambord; but many of them did not compromise themselves, and waited quietly in the provinces. Many others told their old friends of the monarchical party that they were acting as indirect allies, and wished to protect them against the most extreme Legitimists. I feel a moral certainty that if nothing had happened the Monarchists would have carried a small majority in the Chamber; that if the Comte de Chambord had made a public declaration in conformity with the language of the negotiators of the fusion, this majority would have swollen immediately to a very high number. The Republicans themselves now confess that the Comte de Chambord has destroyed his own chances and, for the present at least, all the chances of the monarchy.

It will be a curious political enigma to explain for what reason and under what influences the last Bourbon has thrown away the French crown, which was so near him. Why did he keep France in the dark for more than a fortnight? Why did he allow his friends to frame a bill which contained all that he was unwilling to give? Was M. Chesnelong, whose respectability is above doubt, so confused and so moved by the presence of the future king, that he misunderstood his expressions, and was he such an inexperienced negotiator that he mistook his own desires for positive facts? Did the Church and did the Jesuits, who are said to have influence at Frohsdorf, at the last moment forbid the Comte de Chambord to make any concessions to the spirit of the time? But the Jesuits are generally credited with some worldly wisdom; and they must see that the fall of Henri V. is a blow to the Catholic Church. Was Henri V. really surprised to find that the French were not unanimous; did he think that they were still too divided, and that the Revolutionary venom was not sufficiently exhausted? At the moment of jumping the ditch, as Henri IV. said once, was he afraid of falling into the Paris of the Commune, of '93, of 1830, the great capital of barricades? Did the ghost of his father, stabbed at the door of the Opera, visit him? It is said that his wife, since she was threatened with royalty, has done nothing but cry and pray. Who can say what moved this royal monk, who has lived ever since he was born in a moral solitude, keeping his mind inflamed with visions of grandeur in the midst of an obscure and regular life, who has accepted the easy task of scolding a country of which he is ignorant, and is perhaps contented with this rôle of a living providence? We have heard him, after each event, each calamity, exclaiming from a distance, "I told you so." He is the prophet, the Jeremy of kings; he announces revolutions, and war, and the falling of fire and brimstone. But this is all he could do. When he was wanted as a saviour, he was found wanting. Far be it from me to speak of him otherwise than with respect and with pity; but my greatest pity and my greatest regard will always be for France. As for him, he is from this day among the things of the past; his name will go down to posterity with that of the last Stuarts, as a synonym of fatal and hereditary impotence.

And what will become of France, which is to-day, as it was yesterday, monarchical in its instincts? Can a country be changed between the setting and the rising of the sun? Can it be hoped that the fear of the republican party, which had brought France back before the Comte de Chambord, will vanish at once? An earthquake destroys huge palaces and high churches sooner than the little hovels built with mud. The moral earthquake which has shaken France has thrown many things to the ground, but it has not destroyed the subsoil of envy, of cruelty, of low appetites in which Communism is rooted. The Moderate Republicans are alarmed at the defeat of the Monarchical party almost as much as the Monarchists. They have but one cry now, when they can speak out of the presence of their own following: "Why did the Orléans, why did the Comte de Paris, abandon all their claims? Why did they renounce the crown during the lifetime of the Comte de Chambord?" Those know best, among the Republicans, who had been Orléanists all their life, and who followed the lead of M. Thiers at Bordeaux. M. Thiers tried to keep the Orléans in England; he tried to stop the Duc d'Aumale and the Prince de Joinville on their journey from Southampton to Bordeaux; he would not allow them to take their seats in the Chamber; he opposed for months all discussion as to the validation of their election and the repeal of the laws of banishment; he converted most of the Orléanists of any standing—M. de Rémusat, M. Dufaure, M. de Lasteyrie, M. Léon Say, etc.—into Republicans. The Orléans Princes would be exiles at the present day if the Legitimists had not protected them against M. Thiers. The Comte de Paris was obliged to make concessions to them; he has kept true to his word, he has withdrawn his claims to the crown. It is not his fault now if the Comte de Chambord was unwilling to accept it from the Assembly. The engagement which he made at Frohsdorf was so binding that none of the Orléans Princes could be persuaded to accept the regency. The Monarchists, stunned at first, rallied a moment round this idea of a pseudo-monarchy; but Prince de Joinville would not accept the regency, which was offered to him by the most noted Legitimists, and he said that, for the present, he saw nothing better to do than to give Marshal MacMahon a long term of power. The Marshal has refused to have his name of president altered into the name of lieutenant-general; he has distinctly said that he could not, in the present troubled condition of France, remain in power if he were not armed by the Chamber for a long time with great powers, similar to those of a constitutional king—the right of dissolution, the right to make treaties, etc. The prolongation of the powers of the Marshal, and the increase of these powers, became immediately the rallying-point of the Monarchists. "We have the power in our hands," said one to me; "why should we abandon it? We have not sinned against the country; we have committed no fault; we are not in the position of a beaten army, forced to retreat; we are like soldiers who learn on the eve of the battle that the general is dead. Must we run away for that, and abandon our position?" The resolution of the Monarchists is very great, and nobody has shown more presence of mind than the Duc de Broglie, the chief of the Cabinet. It would be idle to deny that the Monarchists at first felt defeated; now they wish to turn their defeat into a victory. It cannot be a victory for the monarchy; it may be a victory for the Conservatives. The leaders of the Conservative party say quietly that, if they cannot have a king, they will at least have a protector; he will be a constitutional king under the name of president. His prerogative will be very great, as his personal character inspires much confidence, and the condition of France requires that the executive power should be surrounded with much prestige. What name are we to give to this new Government? It will be a commonwealth rather than a republic. It will be a personal government, but with parliamentary institutions. Marshal MacMahon has so far never tried to diminish the ministerial prerogative. He considers himself as a soldier, chiefly charged with the maintenance of order. In the new character which the Monarchists intend to give him, he will have new duties and new responsibilities, and a definition of his prerogative will become a necessity.

What is happening now in France is truly extraordinary, and can hardly be well understood by anybody but French people. The Dean of Westminster, who is now in Paris, said to me two days ago: "You are very interesting, but will you never cease to be interesting?" I am afraid not; we are on the point of giving to Marshal MacMahon a lease of power for ten years, with the clear understanding that he must consider himself the president of a provisional republic. He will hold, so to speak, the place of president in trust for the monarchy. As soon as the Comte de Chambord dies or abdicates, the Monarchists expect him to abandon this post and to make room for the Comte de Paris. The Orléans Princes will continue to live in France as private citizens; but they will be considered and treated by the greatest part of the nation as princes of the blood, as members of a royal family. It is hardly to be expected that the Republicans will take the same view of Marshal MacMahon's duties as the Monarchists. They will oppose the prolongation; but, once elected, he will be in their eyes the president of a true republic; and he may, once elected for ten years, frame for himself a theory of his tenure of power which, at some distant day, may not be in conformity with the wishes of the Monarchists. But this is the mystery of the future; for the present, one thing only is certain: the Monarchists have the majority in the Chamber, and, as they cannot make a king, they will make a president for ten years, and invest him with regal power.

Correspondence.

A NOTE FROM MR. JOHN FISKE.

To the Editor of the Nation:

Sir: I received this morning the number of your paper, which is dated Oct. 23, and very delightful it was to see it, after a *Nationless* interval of three months' duration. I read every word of it, and among other things the paragraph in which you mention so pleasantly my article in the *North American Review*. To your remarks concerning my introductory foot-note I shall reply at once with a plea of "guilty," though a defence might be forthcoming were it worth while to cumber your space with it. But as regards what you say about the "controversial maladroitness" of a certain remark of mine in my recent paper on "Agassiz and Darwinism" in the *Popular Science Monthly*, I must crave your permission to correct an apparent misconception—a misconception which I see has called forth animadversions from sundry other American papers, some of them by no means so good-natured as your own friendly criticism. In stating that my mind was fully made up "thirteen years ago" as to the essential soundness of the Development Theory, and in using very emphatic language to describe the strength of my convictions on the subject, I did not commit the unpardonable silliness of alleging the firmness and long persistence of my belief as an argument in support of the theory. I alleged it only as an additional reason, in my own case, why I should have been especially glad to meet with some staggering argument against the theory on the part of Prof. Agassiz. For obviously, if there is *any* chance that one's deepest convictions may be erroneous, the rougher the scrimmage in which they are forced to engage, the better. This, you see, is a very different thing. While I am about it, let me add that the paper in question was not intended as a defence of the Development Theory, or it would have been very differently expressed. It was intended to show that it will not do to cite Prof. Agassiz's *authority* against that theory, since he has never adduced a single scientific *argument* against it; and, furthermore, that in his case, at least, refusal to accept is equivalent to refusal or inability to understand.—Very truly yours,

John Fiske.

London, Nov. 4, 1873.

Notes.

An account of Sir Samuel Baker's expedition to the Upper White Nile, in Petermann's *Mittheilungen* for October 3, is accompanied by a map showing the district traversed from Gondokoro southwards, the route of Pasha Baker, the Egyptian garrison established, etc. The same number contains a map showing the daily drift of the Tyson company from the *Polaris* break-up to their rescue off the coast of Labrador, as well as the vastly shorter boat-course of Buddington and his associates. The whole history of the expedition is thus embraced in this map and the one given in the *Mittheilungen* for July 29.——The unexpected announcement is made that Messrs. J. R. Osgood & Co. have transferred the *Atlantic Monthly* and *Every Saturday* to Messrs. Hurd & Houghton, without change of editorship, and *Our Young Folks* to Messrs. Scribner, Armstrong & Co., who, we presume, will merge it in their new *St. Nicholas*. The fate of the *North American Review* is not yet made public.

—We learn from Berlin that the celebrated and veteran Semitic scholar, Rödiger, the pupil and successor of Gesenius, is about to dispose of his library, being driven to this step, we regret to say, by broken health. Here is a capital opportunity, such as has more than once before offered and been taken advantage of, for some American university or theological seminary to provide for itself at a stroke in the department of Semitic languages and Old-Testament literature. The library is said to contain between four and five thousand volumes, and its price will probably be about three thousand thalers. A catalogue of it is in preparation.

—In the Boston Public Library there is a book which deserves to be classed with the famous Portuguese 'New Guide of the Conversation,' as one of the curiosities of literature. It is entitled a 'Guide for Strangers in the City of Antwerp,' and seems to have been published about forty years ago. The work commences with the following "advertisement": "The underwriter prevents every Gentleman and Stranger that all the alterations and improvements which may be projected and executed in one or other public establishment, shall be immediately rectified, and that the plates of this work shall therefore remain untouched. Phillippe Ville, the Editor." A few pages are devoted to a historical account of the city, in which the author, with a praiseworthy devotion to the truth, remarks "that, when there is question of establishing the beginning of some famous cities, they have recourse to merveillous evenements, and for not throwing ourself in the doubtfulness of fabulous antiquities, we shall only keep us to what history offers." He has no need, however, to "trust on the annals," as "the construction of her buildings prouves its ancientness, and on examening this city, one shall find vestiges, which will bring us from age to age." "Its origin was of a middling extend. His most considerable augmentation, has been done by John the third in 1314; by Charles the Vth in 1543, the city, could not contain the prodigous nombre of inhabitants, who came thither from every part, for establishing themselves, encouraged by the situation of his Port, and by the wealth and abondance of this trading city, an enlargement of 1600 steps in lenth on 244 baoad, was required, that portion of ground contains the magnific Hause-House of which we shall still speak afterwards." But, leaving these dry details, we pass to the description of the bridges: "Four magnific swiping Bridges on the same manner as those in Holland, serve for the communication of the quais, from the citadel, till the doks, they are placed on the entrance of four canals, wich enter in the town, very commodious and sure for vessels of a small description to load and unload there." Speaking of the "doks": "The Emperor Napoleon ordered the two Doks on the nord side of the town, in which he intented to make his men of war pass the winter, now marchant vessels fill up these places where before ships of the line dicted the law." This is what is said of the charitable institutions: "There are 27 Hospitals foundated by pious men, 2 schools for poor children, and a great foundation, where every poor men may come to work when he does not shun it."

—M. Ville is most interesting, however, in his accounts of the various works of art in his "nature country." Commencing with the Cathedral, he says: "Every one avoud, this temple is fare out the finest in the kingdom, its lengthness is of more than 500 steps its largeness of 240 and its elevation of 360. . . . This monument was burned in 1533, excepted the choir, a great part of it had been dommaged without the vigilance of the burghmaster. . . . In 1797 this magnific Temple has been spoliated by profanous and sacrilegious hand. The fame year they sold very cheap, the precious things, which hand been respected till this period and soon the enemies of the holy religion attained their wishes, this temple represented in a few time but a confounded heap of ruines? if any precious things have been conseived, it was only by zeal for arts, and it is a wonder that we can still admire this Church and Steeple, yet eight days and these two Monuments were for ever demolished. In 1810, these Monuments took a new aspect by the cares of Mr. H——, and by the solitude of the administration, at the great satisfaction of the true friends of religion." Following the lead of our author, we pass through the Cathedral, stopping for an instant before "the Pulpit sculped by P. Verbruggen," until we come to Rubens's master-"peace," "The Descent from the Cross." At this point the simple descriptive style is dropped, and language better suited to the subject is used. The birth-throes of genius are vividly portrayed as follows: "Rubens has been heaving in several parts of this picture, it is smoothed and accomplished, and however all is vigorous and animated." The highest eloquence is reached in the closing words: "He deals with the wisest discerning to every figure his just part of affliction in this hard case and with the greatest knowledge he unites sentiment of love to that of veneration, it is an hart-felling scene, which electrises the soul it is an august cermony of religion which penetrate it even to exaltation." An exact knowledge of art is shown in the criticism of another of Rubens's works: "It has been acknowledged by juridict juges that this picture . . . is of a fine drawing, and recollect under this rapport the grandiose of the Caraches." Speaking of an "Assumption of the Virgin," M. Ville says: "All is in movings and occupied by the principal action, these follow with their eyes, the holy Mother . . . those amased of the miracle and being as trancid, cast their eyes towards the glorious way. . . . the aerial sight is produced there to the highest top of understanding." Over the grave of Rubens is "a precious picture composed with genius, drawed with puriness, gracefulness seduces everywhere and at every moment we discover them." A "Crucifixion" by Rubens (in the Museum) is the subject of this favorable criticism: "The Virgin is deeply afflicted: but the promises of his son fortify her against the pangs of a swoon. The horses are of exquisite beauty, that in the corner of the picture who seems to cheer up, is a mighty good thought which makes diversion." In a description of still another of Rubens's "workkx," we read: "St. Francis of Assise feeling his dead approaching desired to be led to the foot of the altar. . . . His clothes are pulled out and naked." But we must end our quotations, though we have left untouched "the magnific Church burned by thunter," the Embarcadere, "with its two landing places, between which are double steps of blew marmor," and the "Galery where is a picture of Zaccheus one of the leaders of the republicans."

—A collection of rare and inedited documents relating to the history of Paris, to be comprised in about 25 volumes of small size, has for its latest

issue 'The Condition, Names, and Number of all the Streets in Paris in 1636,' preceded by a study of the sewerage and public hygiene of Paris after the 12th century, by M. Alfred Franklin. This handsomely printed work will give some idea of what that Paris was which was indeed worth a mass. M. Edouard Fournier, by the way, has shown that it was Sully, and not Henri IV., who originated the famous saying that "Paris vaut bien une messe;" and Sully was still alive in 1636. Two other epochs in the city's checkered history are treated in M. Henri Wallon's 'La Terreur,' a series of critical studies, which have mostly already appeared in print; and in M. C. A. Dauban's 'Le Fond de la Société sous la Commune.' M. Wallon's studies are a sort of résumé of the more recent works on the French Revolution, including several by M. Dauban himself, viz., 'Paris in 1793,' 'Paris in 1784,' 'The Paris Prisons during the Revolution,' etc. The latter's picture of society under the Commune appeared before the final evacuation of France by the Germans, and was temporarily suppressed, because of the head-piece to the title-page, representing Paris as Babylon fallen and in flames, which had been published in Germany in September, 1870. The 'History and Memoirs' of the Comte de Ségur bridge in the person of the author the interval between the Terror and the Commune. They form eight volumes of highly entertaining reading, and conclude a lifelong apology for Bonapartism.

THE OXFORD METHODISTS.*

To those who are interested in tracing a great religious movement to its obscure beginnings, there is something very striking in this brief record by Wesley himself: "In November, 1729, four young gentlemen of Oxford, Mr. John Wesley, Fellow of Lincoln College, Mr. Charles Wesley, Student of Christ Church, Mr. Morgan, Commoner of Christ Church, and Mr. Kirkham, of Merton College, began to spend some evenings in a week together in reading — chiefly the Greek Testament." This was the cradle of Methodism, a type of Christianity which was destined to acquire so great power, and to enrol among its adherents so vast a number of persons, in both hemispheres. In 1735, "we were," says Wesley, "fourteen or fifteen in number, all of one heart and of one mind." Cambridge was a stronghold of Puritanism; but with this exception, Oxford has been the fountain-head of the principal religious movements in the later periods of English history. The Latitudinarians were of Cambridge, but they were rather a theological or philosophical school than a body of inspired and practical religionists. In our own time, the Tractarians, who resembled in many respects the Wesleyan circle in its earliest days, have had their seat at Oxford. Of this circle, John Wesley was of course the leader and master-spirit. Whitefield, who became a zealous member of the "holy club," equalled and even surpassed him as an orator and a preacher to the masses; but in force of intellect John Wesley was immeasurably superior to him, as well as to Charles Wesley, the brother of the Methodist founder. This Oxford brotherhood, who met together to study and pray, were at first Ritualists, and, in their theory of the Christian life, as we have said, were very like the class who bear the name at present in the English Church. They were scrupulous in observing the rules of ecclesiastical discipline, fasted, kept saints' days, received the sacrament frequently, and maintained to the full the doctrine of apostolic succession. They read and re-read writers like William Law, and highly prized books of an ascetic cast. To their credit be it said that they were equally diligent in visiting those who were sick and in prison, and in bestowing alms on the poor.

It took John Wesley ten years wholly to emancipate his mind from what we may term, without offence, Anglican superstitions, and to plant himself firmly and intelligently on the broader ground of a free and consistent Protestantism. He evinced the vigor of his mind in breaking through prejudices which would have hampered him in his great enterprise and have crippled his energy. When he saw that preachers were needed, and that episcopal ordination could not be obtained for them, he selected them, commissioned them, and sent them forth. When he was excluded from the parish pulpits, he preached in the open air, and organized societies of his own. He was not a man to be silenced by the force of conventionalities, or to do what he felt to be the work of God with his hands tied. It has been truly said of Wesley that his mind was logical rather than philosophical. But he was practical, and was not afraid of bold measures which were indispensable to the end. He was not afraid to fight, not frightened by the sound of the battle, nor over-sensitive when he was the victim of assaults. He combined the two essentials of the founder of a religious body—an unquenchable and, we might add, indomitable ardor, and a talent for organization and government. If he had had the first alone, his fire would have burned itself out, with no very permanent results. In the union of these two attributes, but not in any other respect, he resembled Loyola. Ingham, one of Wesley's associates, clung to the Moravians; and the societies which he formed with indefatigable industry came to nothing. He lacked Wesley's constructive and administrative ability. Wesley broke loose from the Moravians, with whom he was so long connected, but whose quiet ways were really foreign to the aggressive spirit of the reform which he was propagating. It is curious to see how the Oxford club dispersed, and how its members became separated and, in some cases, alienated from one another. Clayton remained in the Churchly and Ritualistic path, became a Jacobite clergyman, and so disapproved of the crusade of Wesley against irreligion and ignorance that he broke off all intercourse with him. Hervey, the author of books which were once read by thousands of people with avidity—as 'The Meditations,' 'Theron and Aspasio'—after maintaining friendship with Wesley for nearly a lifetime, became involved in an angry controversy with him on predestination. Wesley and Whitefield parted without quarrelling. The latter was a man of most amiable temper, with whom it would be very difficult for anybody to contend. Holding to the Calvinistic tenet of election, he separated in a friendly way from Wesley. Under the influence of Edwards and other American theologians, Whitefield's Calvinism was sharpened, and he felt called upon in England publicly to preach against the Arminian errors of his old friend and associate. But, prior to his last departure from England, when he, as well as Wesley, was an old man, they met in a very cordial manner.

Of the early associates of Wesley who are described in Mr. Tyerman's volume, the name which is now least obscure is that of Hervey. He became a parish rector and, we are sorry to add, a pluralist. He was considered to be a highly polished writer, and his books, carefully criticised and brought, by himself and by the aid of his friends, to what was deemed perfection as regards literary composition, were in reality widely read by cultivated people of that day. He set out to make discussions of original sin and imputation palatable by prefixing to them descriptions of walks in woods and gardens —the scenes of his theological colloquies—and by garnishing them with flowers of rhetoric. His rather stilted manner and elaborate elegance were then thought to be elements of fine writing.

We cannot say much in praise of Mr. Tyerman's literary qualifications for the task which he has undertaken of narrating the origin of Methodism through biographies of its pioneers. He often favors the reader with commonplace observations like the following, at the commencement of his account of Clayton: "God has wisely and graciously hidden the future from us. We may form guesses concerning it; but we have not the slightest certainty that our guesses will be realized." This sounds like a passage cut out of one of Mr. Tyerman's pulpit discourses. There is a tendency to introduce what Mr. Samuel Weller would call "self-evident propositions." A kind of half-cultivated way of thinking and of expressing thought frequently appears in his pages, together with a naïveté in communicating his personal impressions of men and things. At the same time, Mr. Tyerman, in his 'Life of Wesley,' and in this volume, which forms its sequel, has collected a large amount of valuable matter, and put it in a sufficiently readable form. In most respects we prefer, however, the excellent history of Methodism from the pen of our countryman, Dr. Stevens. Tyerman, of course, enters much more into details, and brings forward, to some extent, new letters and documents. But the reader will seek in vain in his volumes for a broad estimate, in the light of history, of the Methodist Reformation. The materials for such an estimate, however, are provided, and we are bound to thank the author for adding something to our previous stock of information respecting a subject so attractive to students of religion and philosophy.

* 'The Oxford Methodists: Memoirs of the Rev. Messrs. Clayton, Ingham, Gambold, Hervey, and Broughton, with biographical notices of others. By the Rev. L. Tyerman, author of the 'Life and Times of John Wesley.'' New York: Harper & Brothers. 1873.

MAGAZINES FOR DECEMBER.

In the December *Atlantic Monthly* "A Great Deed of Arms" is the title of a passage in early Canadian history, told in Mr. Francis Parkman's wonted manner. The scene opens with the fright of the handful of settlers around the fortified post of Quebec in the spring of 1660, when the Iroquois war was at its height, and when there seemed every reason to believe that the savages, departing from their usual policy of balancing the settlements on the St. Lawrence against the English settlements on the Hudson, had resolved to put the French colonies out of their lingering misery by giving them the *coup de grâce* and destroying at one blow Quebec, Three Rivers, and Montreal. A fiery comet had appeared above Quebec, and seemed to the terrified inhabitants a herald of their destruction; a blazing canoe had sailed across the sky; confused cries and lamentations had been heard in the air, and a voice of thunder had sounded in mid-heavens. These signs appeared none the less portentous that the Seneschal of New France, son of the Governor, had been surprised and killed, with seven companions, at

the Island of Orleans; that, in the summer of 1658, on the day after the Vicomte D'Argenson had arrived at Quebec to assume the governorship, he heard, while washing his hands for dinner, the war-whoops of the Iroquois and the screams of their victims; and that early in 1660 a Wolf Indian, who was burned in the city by Christian Algonquin captors, had informed the Jesuit advisers who converted him that 800 Iroquois were in arms below Montreal and intended the complete extirpation of the colony. "A modern Catholic writer," says Mr. Parkman, speaking of this victim of the stake, "says that the Jesuits could not save him; but this is not so. Their influence over the consciences of the colonists was at that time unbounded"—the whole colony being indeed a mission—"and their direct political power was very great. A protest on their part and that of the newly-arrived bishop, who was in their interest, could not have failed of effect." And he goes on to say that "they did not care to prevent the torture of prisoners of war: not solely out of that shameful spirit of compliance with the savage humor of the Indian allies of the colony which stains so often the pages of French-American history, but also, and perhaps chiefly, from motives purely religious."

The "shameful spirit of compliance" may seem rather strong language to use in reference to the conduct of men who felt themselves compelled to make use of the friendship or alliance of such a people as the Jesuit founders in the Canadian woods, and pressed upon by those redskin Romans, the Six Nations, found themselves in contact with. The reader of such narratives of captivity among the Canadian Indians as for instance that of Quintin Stockwell in Mather's 'Remarkable Providences,' has it brought home to him, as history hardly can bring it, how long and loose was the tether which the French had to allow their savage confederates, as indeed it stands to reason should be the case; and the compliance hardly shameful either. But whether the compliance is to be called shameful, or a piece of political or religio-political necessity, it was made, and the Wolf was burned with all the customary atrocities and, doubtless, "chiefly from motives truly religious," for the spiritual countrymen of Loyola were not in the wilderness to see that the earth be replenished, but that heaven be filled fuller. Torture "they thought good for the soul, and in case of obduracy the surest way of salvation. 'We have very rarely indeed,' writes one of them, 'seen the burning of an Iroquois without feeling that he was on the path to Paradise; and we never knew one of them to be surely on the path to Paradise without seeing him pass through this fiery punishment.' So they let the Wolf burn; but first having instructed him after their fashion they baptized him, and his savage soul flew to heaven out of the fire. 'Is it not,' pursues the same writer, 'a marvel to see a wolf changed at one stroke into a lamb, and enter into that fold which he came to ravage?'" To show that the world may grow two hundred and thirteen years older without, in some places, growing two hundred and thirteen years wiser, we may compare these utterances of St. Ignatius's spiritual countrymen in New France in 1660 and the letter written a week ago by a Cuban archbishop in the case of twenty of the *Virginius's* wretches: "Great jubilee fills our hearts when we announce to your Excellency that among the criminals of the *Virginius's* crew, twenty freely and spontaneously asked to become Catholics. . . . The prisoners were turned over to their spiritual advisers at eight o'clock in the morning and shot at four P.M., thus giving our priests only eight hours to convert the twenty."

Mr. Parkman's works have shown that whatever it may be to be a devotee of Ignatius three hundred years after date, to be so in 1660 could lead the devotee to honor by many roads; and this story of "A Deed of Daring" is well worthy of its title. The Wolf's secret, with which he requited the labors of his spiritual advisers, was a true tale, except for some slight exaggeration, and Mr. Parkman's business is to tell us how, by the zeal and courage of seventeen young Frenchmen of Montreal, the descent upon the colonies was stayed.

Reminiscences of a later war are to be found in Mr. Sidney Andrews's paper on the colored people's best-known church in Washington, the Israel Bethel Church, as it was in the first days of the Rebellion, and on afterwards until near the end of the war. Interspersed are specimens of the peculiar "spirituals" which are used in public worship by the Southern negroes, and which the Hampton band and other colored bands of singers have made known to many Northern and some English audiences.

As important and readable as anything else in the *Atlantic* is Mr. L. J. Jennings's essay on the career and character of Mr. Disraeli, concerning which Mr. Jennings writes with a degree of knowledge uncommon on this side of the water, and with a degree of sympathy which, combined with his knowledge, makes him a forcible pleader in behalf of his favorite. He has a great deal to say which the reader will find it of interest to hear, and we dare say his article will, to some extent, do for Mr. Disraeli what Mr Disraeli has always had a knack of doing for himself—that is, make him personal friends among his political adversaries.

Besides Mr. Whittier's poem, "John Underhill," and a graceful poem by Mr. T. B. Aldrich—"L'Envoi: Written on the Fly-leaf of a Reprint of Some Early Poems"—there is nothing else that calls for mention in the body of this number of the *Atlantic*. Outside of the critical departments, it appears to be rather lighter than usual. Captain Underhill may justly be allowed an honorable place in the company of Mr. Whittier's godly heroes.

In the *Galaxy*, Mr. Welles makes his final strictures on Mr. Adams's eulogy of Mr. Seward. As interesting as anything else that Mr. Welles here tells us is his statement that at the time of Commodore Wilkes's capture of the *Trent*, and while all the country and nearly every member of the Cabinet (Mr. Seward included) were rejoicing over it, Mr. Montgomery Blair from the first denounced it as "unauthorized, irregular, and illegal." Indeed, Mr. Blair was for having Commodore Wilkes ordered to take the *Iroquois* and go with Mason and Slidell to England, and there deliver them to the British Government before Lord Palmerston should have time to demand them. Thus, he argued, we should show our confidence in our own strength, and our contempt for rebel emissaries. Mr. Blair has had the credit of so many other things that it is no more than fair that he should have the credit of this also.

In "The Wetherel Affair," by Mr. De Forest, Count Poloski is apparently about to hear of something still further to his disadvantage, and Miss Nestoria to reap the due reward of her creditable reticence. Mr. Justin McCarthy goes on with the fourth, fifth, and sixth chapters of his new serial story, and, moreover, makes separately a sketch of the Czarovitz. Mr. Junius Henri Browne analyzes Signor Salvini's conception and rendition of *Othello's* character, and we think will assist the actor's hearers to form a judgment of his performance, and to enjoy it. The *Galaxy*, also, has a poem entitled "Fishing," by Mr. George A. Baker, Jr., in which the "building lines" are perhaps a little staring, but which is so neatly done that it would hardly do discredit to Mr. Frederick Locker.

In the *Catholic World*, an article that will attract the general reader is the last portion of a continued essay entitled "Catholic Literature in England since the Reformation"; but it will not be found critical or instructive. For instance: Pope personally was a Roman Catholic; but surely his writings belong to "Catholic literature" about as much as the writings of his friend Wycherley. The church had probably no more to do with the production of the one than of the other. It may be worth while to say here, apropos of Pope and his religious works, a word or two that we forgot to say on another occasion when the *Catholic World* was talking about Pope. Mr. S. Baring-Gould had, if we recollect right, been saying something about the Methodists, their origin and the origin of their lyrics, and remarked that in his opinion no writer who was not far removed from the centre of Catholic truth would ever have written such a hymn as that beginning:

"Vital spark of heavenly flame."

And this opinion Mr. Gould held for the reason that further on in the hymn some countenance is given to the grave error of believing the soul of man to be of kin to the angels. It says:

"Hark! they whisper, angels say,
Sister spirit, come away"—

which, says Mr. Gould, is as much as if we were to say that human souls and angels are of one substance—sisters in fact. The question involved is not desperately momentous; but the magazines that approve philosophers like Mr. Gould with their theories as regards Methodists and Catholic literature, may probably be required to recollect that the "sister spirits" are the production of Pope.

Sportsmen in search of Utopia should, before going elsewhere, give careful attention to Mr. S. C. Clarke's article on East Florida in *Lippincott's Magazine*. The region he describes appears to be simply a country for the angler to dream about, and miraculous draughts of fishes to be in the ordinary course of nature. Other sportsmen, also, as well as anglers may resort to East Florida without fear that luck will ever be against them whatever they want—from a snipe to a young alligator or a four-foot cuttle-fish. Mr. Clarke, at the end of one day's shooting and fishing, makes out a list that ought to take many a rod and double-barrel out of our Northern cities and into the ideal Floridian winter climate.

In the "Monthly Gossip" department of the magazine there is printed a communication from the late Mr. L. Gaylord Clark, who talks about some letters received years ago by his brother, the late Willis Gaylord Clark, from English correspondents. But one letter is quoted at any length, a letter written by Bulwer. Sad stuff it is too, if we must say so, and of a kind to reconcile one to the satirical gibing quoted by Mr. Clark a little further on from a dusty old *Punch*, in which "Bulwig" is flayed by M.

Jeames Yellowplush, who was not pleased with "The Sea Captain" just then offered to the London play-goers, and who signified his disapproval in a way that Sir Edward no doubt thought low enough. The letter to his American correspondent indicates his feelings, and we may add that 'Kenelm Chillingly' and 'The Parisians,' those children of his old age, show how indomitably incurable he was.

The 'Princess of Thule' seems to show, as it goes on, that its author is more certain of pleasing—or satisfying, for he always pleases—when his various excellent powers are utilized in the management of a courtship, than when he ventures into deeper waters. We should say that for some time now this story of 'The Princess of Thule' has got pretty much out of Mr. Black's hands.

We may mention, among other articles in *Lippincott's*, some noticeable verses by Miss C. F. Bates, and a readable sketch of Monaco and of life in that principality. It is like opéra bouffe to read of the Hereditary Princess's coming down to breakfast and eating all four of the boiled eggs labelled as designed for the morning repast of His Highness the Reigning Prince, Her Highness the Princess Consort, and His Highness the Hereditary Prince; of her being thereupon lectured by her father-in-law for such an audacious and entirely English breach of law, etiquette, and decency; of her giving His Highness rather better than he sent; and of her finally running away from her royal relatives and being chased "across lots," as we say in America, by two gendarmes, and getting home to her mother with her clothes torn half off her back.

The December *Harper's* is most interesting in its extracts from Mr. Maunsell B. Field's entertaining "Memories of Many Men," which ought to afford the readers of the magazine many "Chapters of Gossip." In this one Dickens is a principal personage, and although Mr. Field appears to be embittered against him, it is nevertheless true that in view of the unmeasured and gross eulogy which Mr. Forster is publishing as a biography of his friend, it is right to keep in mind this other side of the shield. Mr. Conway's "South Coast Saunterings" is always interesting, and this instalment of it not the least so; Mr. Nordhoff's "Northern California" is in another way equally good; and there is an illustrated article on the Erie Canal, done by two young men, an artist and a journalist, who made the through trip in a canal-boat. Like the other magazines, *Harper's* has its article on the panic and the crisis.

The principal thing in *Scribner's Monthly* is a poem by Mr. Bret Harte which recalls, and indeed we may say equals, the best serious writing, whether in verse or in prose, that this author has ever done. The rest of the magazine is of the usual variety and interest, the illustrations in particular being deserving of unusual commendation.

CHILDREN'S HOLIDAY BOOKS.*

THE propriety of inviting American youth to contemplate the career of Hugo's 'Gavroche' has appeared so great to Mr. M. C. Pyle that he has been at the pains to translate and adapt such scenes in 'Les Misérables' as are adorned with the figure of that personage. We do not know that much objection need be made. To "hint a fault and indicate dislike" may perhaps answer every necessary purpose. If the heir of the house may be trusted in the company of the Artful Dodger and Young Bailey without fear of his receiving moral detriment, as probably he may, perhaps the young French gentleman also is a sufficiently good companion for him. An objection to such a view might perhaps be based on the greater reality of Hugo's creation, and his imputed heroisms and claim to respect. We have heard of boys who became pilferers and young profligates after reading 'Jack Sheppard' or seeing it on the stage; but not of any who took to "cly-faking" because that was Mr. John Dawkins's way of life. The constant propinquity of a boy of Oliver Twist's character may, to be sure, have something to do with this. But Gavroche, although he fights at barricades with more than adult courage and is full of resources, and, being at war with society, is as charitable and magnanimous as any other of M. Hugo's heroes, unites to all these high qualities an impudence which already is not altogether unknown in some American homes. He may thus be dubious company for Young America. Parents holding a different opinion will at any rate find the book a well and clearly printed duodecimo not too dear.

The history of 'Lady Green-Satin and her Maid Rosette' is intended for young readers, but it will interest older ones by its strong local coloring. The hero, Jean Paul, is a lad who makes his way from his peasant home in the Pyrenees to Paris, where he earns a living by exhibiting two white mice trained by himself. Of these, "the largest was dressed in the magnificent dress of green satin, which fitted it extremely well: the petticoat was long, and nicely puffed out, and when my lady the mouse stood up and walked the train had a most graceful appearance." As for the other, "the long, white, slender tail of Rosette was seen below her dress." Jean Paul's career was nearly closed on one occasion by the piratical attempt of a tom-cat; but his "charming animals" escaped, and he lived for several years upon their accomplishments. In Paris, he met good company, pretty Madeleine Bienfait among others, a child of his own age. He marries her finally, but not before acquiring several amenities not generally known in his native village, such as reading, and writing, and the wearing of good clothes. The somewhat argumentative tone of Madame des Chesnez, in advocating these practices, will be amusing to the American reader; so, too, will be the sixteenth chapter, which hardly could have been written by an Anglo-Saxon. It shows how, under the supervision of Madeleine's excellent mother, Jean acquires a love for cleanliness, and is exhorted by that lady to courage in his first desperate encounter with the bath-tub. In the main, however, the old-world naïveté of the story is genuinely pleasant. There is no affectation about its style, and the residual flavors of French in the translation do not spoil its piquancy.

If we commend the subject of 'Children of the Olden Time' as being the best part of it, it is not because the treatment of the subject cannot also be praised. But it is particularly pleasant in days so prolific of fictitious, and too often aimless, juvenile literature to come across a little historical study like this, in which the facts will not only be a useful addition to a young reader's stock of knowledge, but may give a good notion to a boy or girl how to select a special topic from history, follow it up, and bring other reading to bear upon it in a way to be good mental discipline. In point of literary style, however, this interesting essay must be taken rather as a model of what to avoid than what to imitate. This is especially a pity, because a small amount of care in revision would have corrected most of the mistakes. Between the confusion of pronouns and the ellipses, it is often difficult and sometimes impossible to decide which substantive is under discussion. Speaking of the Princess Elizabeth, the author says, "By a letter from her governess to Lord Cromwell, she seemed actually to need clothes; but she speaks most highly of her character, saying she is 'as toward a child and as gentle of condition,'" etc.; while in the account of the visit of Madame D'Arblay and her boy to the household of George III., there is quite a hopeless confounding of personages. Another blemish which is noteworthy, as showing ignorance of American usage, is the writing of the word "nigger" without quotation marks; "the nigger playing the fiddle," p. 109. It ought to be a good thing for the luxurious children of our day to know what their forefathers did not have in the way of toys and amusements, and what they did have in the way of discipline and lessons in hardihood, and to recollect how many great men grew up under such training. The account of the barbarous old Saxon practice of destroying the weakly babies is a very literal version: "If a poor, tiny baby, a few hours old, objected to be placed on a slanting roof or the bough of a tree, and uttered its wailing cry of terror, they ordered it to be killed. . . . But if the baby laughed and crowed, it was brought home joyfully and saved." Any baby that "laughed and crowed" at the age of a few hours would be a curiosity nowadays, and we fear that the nation which made all its new-born heroes uncomfortable, and then killed them if they cried, would soon cease to exist. The idea that the nursery rhyme, "Hush-a-bye baby upon the tree-top," originated in this custom is ingenious, but it does not explain the second couplet. Probably few people know the origin of the senseless expression, to "know B from a barn-door," which is in vulgar use with us. Probably it is "to know A B from a battledore"; the "'battledore,' or 'first book' for children, was printed on card-board, and contained the alphabet and simple combinations of letters, and was a substitute for the horn-book."

In virtue of a great part of its contents, 'Northern Lights' belongs to the general class of story-books for children with which not only the kingdom of Liliput, but all the world, young and old, has been made familiar by Hans Christian Andersen, the brothers Grimm, and their numerous followers and co-workers. But besides "the mill that ground everything one wished for," and which is now grinding out salt at the bottom of the sea; the two idle sisters whom the cat guided into the enchanted meadow, and who afterwards were deservedly transformed into a spider and an ant; the owl's party, to which the thrush was invited because "we must seem to encourage art," and after singing at which the thrush resolved that, for his part, he would thenceforth leave the great fowls alone and be the little birds' songster; the learned entomologist and book-worm who found a strange insect

'Northern Lights: Stories from Swedish and Finnish Authors. Translated by Selma Borg and Marie A. Brown.' Philadelphia: Porter & Coates. 1873.
'The Childhood of the World; a Simple Account of Man in Early Times. By Edward Clodd, F.R.A.S.' Boston: Shepard & Gill. 1873.

called Genius, and did not know how to classify it; the seven little apple-sprouts whom at first the very carrot-tops laughed at for being so small, but who grew to be trees, and some of whom were of an idle disposition, and others were discontented, while one was a humble-minded tree, with a desire to be useful, and turned out to be the only one of the seven who had luck and survived to old age; Skrynkleben, the happy tailor, who guessed the three guesses and married the princess; the "boy who could stand on his nose," and who, by the diligent use of this talent, made a fortune, and came home rich to his grandmother; the sea-king's gift to the fisherman's wife, whose desires increase as her wishes are granted—besides all these familiar figures and lessons, there are several stories of other sorts, showing that the translators have ranged as far away from folk-lore as to the region of the Sunday-school story in one direction; the love-story in another; and, in a third, the village portrait sketch—as if one of Miss Mitford's had been written by a child, with a child's recollection of the gray old village doctor and schoolmaster. All is good of its kind, however, and there is nothing that boys and girls may not be the better for reading; for the peculiar talent of the northern nations for making stories full of affection and simple or romantic sentiments and homely wisdom, all conveyed to the childish mind through a happy system of symbolism, is very well illustrated by the writers in 'Northern Lights.' Side by side with this talent, or at the bottom of it, is the thorough understanding of children's character and ways, and the enjoyment of them which most of these writers are sure to show. One amusing example of this is the story of a terrible brigand of the name of Bullerbasius Rummelfelt. It is a story read from a manuscript by Miss Hilda, aged ten, to Master Lasse, aged six. One Sunday afternoon, Hilda calls Lasse to "come here." Lasse, who is sitting in the corner trying to stick on again a leg of his wooden horse—broken off by its owner in a fit of bad temper because the horse would not go fast enough—pretends not to hear, and abides in his place. Hilda, however, informs him that she intends to read to him something that will amuse him. Lasse, thinking that perhaps he is to be told about Bluebeard or Lunkentus, at once recovers his hearing and goes over to his sister. She then informs him that what he is to hear is the exploits of a brigand named Bullerbasius Rummelfelt. Lasse at once pricks up his ears, that brigand being, as he at the moment supposes, quite unknown to him. A brief preface informs him that once there was a brigand called Bullerbasius who had a fairy for a godmother, and who made so much disturbance in the world that his godmother found it necessary to begin writing a book which she had resolved should be published at Helsingfors, in order that every one might know how bad and unreasonable Bullerbasius was. This record Hilda had borrowed, she said. It opened with a brief entry made on the first of January, and to the effect that on the morning of that day Bullerbasius Rummelfelt began the year by kicking down his bed, and soon afterwards putting his stocking in the wash-basin to see if it would float in water; his mamma coming in gave him a slap with the wet stocking. At this incident in the life of the celebrated outlaw, Lasse looked exceedingly surprised; he however said nothing. But at the second incident narrated by Miss Hilda, and which was concerning a cat cruelly shut up by the chieftain in a heated oven, light dawns upon Lasse's mind, and he formally identifies himself with Bullerbasius and enters into a defence of him and himself. Nevertheless he is not spared the recital of the whole list of his offences—an inventory extending from January 1st to the 4th of the following December, the day of the recital or near it. Good, too, and rather out of the usual line of these story-books, is "The Savoyard." It recounts some singular adventures which befell little François, the Savoyard boy, and his rival and enemy, the adult Guiseppo. As we are first introduced to François, he is in Paris, basking in prosperity; the inhabitants of that gay capital being much pleased with a trained monkey, Cæsar by name, of which François is master, and by means of which he expects soon to be able to earn a dowry for his sister Nanon, who cannot be married until she has two thousand francs. But by-and-by there comes on the scene Guiseppo, who is no less a person than Nanon's unsuccessful suitor, and who not only is the owner of a very talented dog, Brutus, but who is resolved that, if Brutus's accomplishments do not drive Cæsar from the stage, he himself will by main strength drive Cæsar's master out of Paris. Here, it will seen, are materials for an exciting story; and we should say that means of further excitement are provided by an Englishman—of the German variety—who incites all four of our heroes to combats, and to that end makes a free use of his large fortune. So ingenious are the methods by which virtue finally triumphs over Guiseppo and Brutus that we do not mind gratifying the reader's curiosity by saying that triumph she does and that Nanon gets her dowry. Their curiosity about the methods the book must gratify. It is a little book that we may very well commend to the favorable consideration of our readers; and considering how few are the holiday books of the year, we may commend it to their attention the more heartily. Outside of the old and perennial favorites, they will not find many that are better or so good.

Mr. Clodd truly says in his preface that the compilation of such a work as 'The Childhood of the World' would have been impossible till within a very few years, owing to a want of knowledge on the subject; and we will add that only lately has theological rigor so softened that such a work, intended for the young, could escape being put in the orthodox *index expurgatorius*. For the author will have it that science has eliminated the Devil from the universe, along with other myths and superstitions; he places in one category the Hebrew, Brahminic, and Buddhist sacred books; and calls those who "say a verse out of the Bible, or gabble over the beautiful Lord's Prayer, because they think that in some mysterious way they get good by so doing," fetish-worshippers of a lower order than savages commonly so called. On the other hand, Mr. Clodd is manifestly reverent and devout in spirit, quotes the Scriptures frequently, and is not so thoroughly possessed of the scientific method but that he sometimes has recourse to the doctrine of final causes. "If God had given man," he says on p. 20, "thick, hair-covered skin, he could not have moved from place to place with comfort; and so man is made naked, but given the power of reasoning about things, and acting by reason." There are plenty of like examples of beginning at the far instead of at the near end of the problem of human existence, particularly in Part II., concerning man's moral and religious progress. In the following extract the idea of development from a lower state to a higher is almost lost sight of, and one would hardly expect to find such a passage in a strictly scientific treatise: "The cause of the shameful sin and crime of which every place in the world has been more or less the scene, has sometimes been man's ignorance of what is due to his God and his fellow-man, but more often his wilful use of power to do evil; forgetting, in his folly and wrong-doing, that the laws of God change not; that sin is a fair-dealing master, and pays his servants the wages of death." Mr. Clodd, too, has little hesitation in assigning limits to human enquiry. Thus: "It would be making another guess—and, as we shall never know whether we have guessed right, what is the use of guessing?—to say how many years man has lived here." In other words, knowledge which is not exact or positive knowledge is of little worth; whereas, to take the case in hand, the negative evidence as to the age of man is of the utmost consequence in accounting for his progress, and is indispensable to a right understanding of the order and duration of the steps towards our present civilization. Our author, however, does not conceal this evidence, though he misses a good opportunity of stating the lapse of time necessary to the formation of a stalagmite floor; on p. 41 he permits it to be inferred that the bone deposits in the Brixham Cavern in Devonshire may be eleven hundred thousand years old.

In general, we should have been better pleased with this praiseworthy essay if the illustrations of the narrative had been more numerous, and with more frequent comparison of primitive usages still extant; and we shall expect Mr. Clodd's successor in the same field to appreciate the value of pictorial accessories to the text. How easy it would be to show by this means that almost all the stages of human development may even now be studied in different parts of the earth.

BOOKS OF THE WEEK.

PUBLISHED THIS DAY.

I.

MILL'S MISCELLANEOUS Works. Uniform Library Edition. Tinted and laid paper, $2 25 per vol. (except vol. on Comte). The Autobiography, 1 vol.; Dissertations and Discussions, 4 vols.; Representative Government, 1 vol.; Sir William Hamilton's Philosophy, 2 vols.; On Liberty, The Subjection of Women, both in 1 vol.; Comte's Positive Philosophy, 1 vol., $1 50. The 10 vols. in a box, $21 75.

II.

STRAUSS'S THE OLD FAITH AND the New. A Confession. By David Friedrich Strauss. To which is prefixed the author's "Prefatory Postscript." 12mo, $2.

"I have never desired, nor do I now desire, to disturb the contentment or the faith of any one. But where these are already shaken, I desire to point out the direction in which a firmer soil is to be found."—Pp. 9, 10.

"An investigation of some of the most important questions that a candid mind can ask of the world. . . . A book which we feel sure, both from the nature of the subjects treated, the serious manner of discussion, and the deservedly great reputation of the author, will make its mark upon the time, not so much as an attack upon what we venerate, as an apology for those who honestly differ from the majority of their brothers."—*Atlantic Monthly.*

"It states the whole case against the old theologies with such frankness and clearness as its most unfriendly critics must commend. As a contribution to the literature of religious controversy, it is certainly the most notable book of the year."—*Literary World.*

III.

BUZZ A BUZZ; or, The Bees. From the German of Wilhelm Busch (author of 'Max and Maurice'). By Hezekiah Watkins With the German Illustrations, and 28 original designs by Park Benjamin, all of which have been handsomely colored. 8vo, $1 50.

The author of this humorous book has gained a world-wide reputation through his spirited designs, which abound in the *Fliegende Blätter* (the German *Punch*). He was first introduced to the American public by his very successful juvenile story of 'Max and Maurice.'

Nearly Ready,

A SUPERB GIFT-BOOK FOR 1873-74.

TAINE ILLUSTRATED BY DORE. A Tour Through the Pyrenees. By Taine. Illustrated by Doré.

HENRY HOLT & CO., Publishers, N. Y.

D. APPLETON & CO.,

549 AND 551 BROADWAY,

Publish this day:

I.

A New Volume of the "International Scientific Series."

THE STUDY OF SOCIOLOGY.

By Herbert Spencer, author of 'A System of Philosophy,' 'Descriptive Sociology,' etc., etc. 1 vol. 12mo, cloth, price $1 50.

This forms the fifth volume of the "International Scientific Series," which is intended to embrace a series of popular small works in the most interesting departments of advancing science.

The volumes already issued are:

I. FORMS OF WATER, in Clouds, Rain, Rivers, Ice, and Glaciers. By Prof. John Tyndall, LL.D., F.R.S. 1 vol. 12mo, price $1 50.

II. PHYSICS AND POLITICS. By Walter Bagehot. 1 vol. 12mo, cloth, price $1 50.

III. FOODS. By Edward Smith, M.D., LL.D., F.R.S. 1 vol. 12mo, cloth, price $1 75.

IV. MIND AND BODY. The Theories of their Relation. By Alex. Bain, LL.D., Professor of Logic in the University of Aberdeen. 1 vol. 12mo, cloth, price $1 50.

II.

FRENCH HOME LIFE. Reprinted from *Blackwood's Magazine.* 1 vol. 12mo, cloth, price $1 50.

"In republishing these essays on servants, children, furniture, food, manners, language, dress, and marriage, in a collected form, the writer hopes that they may serve to show what some of the springs of French home life at this moment are; or, more exactly, what they appear to be to an English looker-on, who has lived for a quarter of a century in France, amid ties and affections which have made that country his second home."—*Extract from Preface.*

Either of the above, when not to be had in Bookstores, sent, post-paid, by mail to any part of the United States, on receipt of the price.

HARPER'S CATALOGUE. The attention of those designing to form libraries or to increase their Literary Collections, is respectfully invited to Harper's Catalogue, which comprises a large proportion of the standard and most esteemed works in English Literature—*comprehending over three thousand volumes.*

Librarians, who may not have access to a trustworthy guide in forming the true estimate of literary productions, will find this Catalogue especially valuable for reference.

The Catalogue is arranged alphabetically by the authors' names, anonymous works by their titles. The index is arranged by the titles of the books, besides having numerous appropriate heads, each general head being followed by the titles of all works on that subject.

Harper's Catalogue sent by mail on receipt of six cents.

Address HARPER & BROTHERS,
Franklin Square, New York.

NEW BOOKS PUBLISHED NOVEMBER 22D.

MR. LELAND'S BOOKS.

BIANCA CAPPELLO.

THE CARY BALLADS

HURD & HOUGHTON, NEW YORK;

THE RIVERSIDE PRESS, CAMBRIDGE,

HAVE NOW READY:

I.

THE EGYPTIAN SKETCH-BOOK. By Charles G. Leland, Author of 'Hans Breitmann's Ballads,' etc. In one volume 16mo, cloth, $1 75.

A jocular, irrepressibly amusing book of travels, with equal parts of fun and sense.

II.

THE ENGLISH GIPSIES AND their Language. By the same author. In one volume 16mo, cloth, antique, red edges, $2 75.

A book of curious, out-of-the-way lore.

III.

BIANCA CAPPELLO. A five-act Tragedy in Verse, by Elizabeth C. Kinney. In one vol 16mo, cloth, $1 50.

The ambition, guilty love, crimes, and tragic death of Bianca Cappello, "the golden-haired sorceress" of Venice, are the theme of Mrs. Kinney's new production. It will be welcomed as a sustained dramatic work by an American author, and for the poetic vigor and action which engross the reader from the first scene to the close.

IV.

BALLADS FOR LITTLE FOLK. By Alice and Phœbe Cary. In one vol. small 4to, cloth, extra, $1 75.

The Cary Sisters gave their best to the children.

In Press, for immediate publication.

Mrs. Clement's New Handbook of Painters, Sculptors, Architects, Engravers, and their Works.

and full Lists of the Publications of

E. ARBER, JOHN RUSSELL SMITH, and *HY. G. BOHN.*

Sent by mail on receipt of stamp.

G. P. PUTNAM'S SONS,

Fourth Avenue and Twenty-third Street.

DOES IT PAY? One of the Agents of *The Christian at Work*, T. De Witt Talmage's paper, recently obtained 380 subscriptions in about eighty hours' absolute work. This was great success, to be sure, but the agent had a fine paper and superb chromos to back him. There is room for more agents of the same sort. Samples and terms free. Office, 102 Chambers Street, New York. See advertisement.

"The threshold weeps forty days when a girl is born."

PUBLISHED THIS DAY.

THE WOMEN OF THE ARABS. By Rev. Henry Harris Jessup, D.D., Seventeen years Missionary at Beirut. Edited by Rev. C. S. Robinson, D.D., and Rev. Isaac Riley. 1 volume large 12mo, beautifully printed, and fully illustrated with numerous fine engravings, cloth, extra, price $2.

The wide reputation of the author, and the great interest in the condition and prospects of women in Eastern lands, make this work especially timely. Written in a popular style, and having a great amount of new and interesting information as to manners, customs and home-life of the East, the work has as great interest for the general reader as for those especially interested in its subject.

For sale by all booksellers and by the Publishers,

DODD & MEAD, 762 Broadway, New York.

THE DAILY BULLETIN.

THE BEST COMMERCIAL PAPER.

OPINIONS OF THE PRESS, 1873.

The New York *Daily Bulletin* is exceeded in size by only two of the daily blanket-sheets of the city. It is strictly a first-class paper. It gives unusual space and prominence to its market reports, which cover every important branch of trade, and is also an authority on commercial statistics.—*New York Evening Post.*

The features of the *Daily Bulletin* are the fulness and accuracy of its market reports, to which it gives more space than any general newspaper can afford to set apart for that purpose. The editorial department of the *Bulletin* is able, and its business and railroad news is full and fresh.—*New York Tribune.*

There is no better paper of its kind in this city or this country, and it is not surprising that the business community are finding it out.—*New York Evening Express.*

The *Daily Bulletin* is now the acknowledged financial and commercial paper in this city, and has an array of facts and figures about markets and produce at home and abroad that fairly bewilders the commercial editors of the dear old *Journal of Commerce.*—*New York Star.*

The editorials in the *Bulletin* are able, and are very extensively quoted both here and in Europe.—*New York Evening Mail.*

The *Bulletin* is exclusively a commercial and financial journal, and as such furnishes complete and trustworthy reports of the various trade markets. Its editorials are always able and intelligent.—*New York Commercial and Financial Chronicle.*

New York *Daily Bulletin.*—This is one of the best and most trustworthy commercial papers published in New York City. Its size is now more nearly equal to its merits, and its enterprise cannot fail to win it still further patronage from the business community.—*Utica Morning Herald.*

We like the New York *Bulletin*, and shall continue to like it, although it is enlarged. It is a rare thing among commercial papers, brimful of news in its own field of fresh commercial intelligence interesting to everybody. Commerce is not a dull subject, as the *Bulletin* proves.—*Springfield, Mass., Republican.*

The New York *Daily Bulletin* is one of the best and most reliable commercial dailies published in the country.—*Richmond Whig.*

The New York *Daily Bulletin* is decidedly the ablest daily, designed as an exclusively commercial paper, in the country. Its columns are ever filled with the latest news from all sections, and its editorials are really the most sound and instructive that grace any of our exchanges.—*New Orleans Picayune.*

The New York *Daily Bulletin* is the only daily morning paper published at the North devoted exclusively to commercial and financial affairs. Making this department its specialty, it has won, by the marked ability and unflagging industry with which it has been conducted, a prominent position in the front rank of commercial journalism.—*New Orleans Times.*

The New York *Bulletin* has met with a substantial and deserved success as a paper devoted to financial and commercial interests. It now contains thirty-six columns of matter. Its business management speaks for itself, and its editorial columns are conducted with marked ability.—*Cincinnati Gazette.*

The New York *Daily Bulletin.*—The *Bulletin*, as all know upon whom devolves the duty of making up commercial matter for a paper, is the most valuable in material of any commercial issue in the country.—*St. Louis, Missouri, Republican.*

Office, 30 AND 32 CEDAR STREET.

Price $10 per annum.

THE WEEK IN TRADE AND FINANCE.

NOVEMBER 24.

THE situation in financial affairs shows a satisfactory improvement since our last writing. With the exception of a short time on Friday and Saturday, money has been easy. On Thursday the Bank of England rate of discount was lowered to 8 per cent., with the prospect of a still further reduction, the necessity for its advancement having entirely passed. The news from Washington in regard to Cuban matters is rather more pacific, and business men are disposed to take a more quiet, common-sense view of the troubles likely to arise out of the seizure of the *Virginius*.

The following shows how the banks stood according to the last published statement before the panic and that of last week:

	Sept. 20.	Nov. 22.
Loans	$278,421,700	$248,067,300
Specie	18,844 600	17,568,700
Circulation	27,414,200	27,299,800
Deposits	198.040 100	167,967 200
Legal tenders	34,307,900	30,899,800

Commercial paper has been in more active demand, and rates are lower than those quoted last week, the range for the best names being from 10 to 18 per cent.

The associated banks held a meeting on Thursday to take action upon the report of the "Committee of Nine," which proposes to make certain radical changes in the conduct of business among the banks belonging to the present Clearing-House Association. At the meeting the representative of each bank was called upon to state the position of his bank on the subject. It is said that forty banks out of the sixty-eight represented were in favor of the adoption of the report in substantially its present form. The other eighteen banks were either entirely opposed to adopting the report, or wished for delay before taking final action upon it. It is very proper to notice that, of the $122,000,000 capital and surplus represented by the banks belonging to the Clearing-House, $50,000,000 are owned by the banks opposed to the adoption of the report of the "Committee of Nine," among them the Bank of Commerce, the Metropolitan and Chemical Banks. Another meeting will be held on Tuesday, when some definite action will probably be taken.

At the Stock Exchange business has been fairly active. The Vanderbilt specialties have been the leading feature of the market, and have exhibited considerable strength. The dividend-paying investment stocks are all strong, and it is likely that on this class of stocks prices will be fully maintained, in view of the demand which may be fairly expected at the commencement of the new year. In the speculative list, the transactions are mostly for account of the brokers themselves, who buy or sell for quick turns, and generally close out their interest in the market every night. There is some demand for stocks from out-of-town buyers, but it is limited. It is thought that a new method of dealing will shortly be introduced into the Board somewhat similar to that of the London Stock Exchange—*i.e.*, buying and selling "for the account," with a settling-day twice a month. It has been proposed to make a clause in the arrangement by which losses shall be limited to 10 per cent. from the time contracts are made until the day of settlement; this would avoid the enormous losses caused occasionally by "corners," and would undoubtedly lead to additional business at the Exchange.

The following shows the highest and lowest sales of the leading stocks at the Stock Exchange for the week ending November 22:

	Monday.		Tuesday.		Wed'day.		Thursday		Friday.		Saturday		Sales.

Pacific Mail	27¾	29¼	27¼	28	27⅜	28	27¾	28½	27¼	28¼	28	29	19,900

Government bonds are strong, with prices generally higher for the more active issues of coupon bonds, such as the '67s. The firmness of gold, and the favorable quotations from London, are sufficient to keep up the prices of our bonds here, besides which the demand for home investment is considerable, and is likely to still further increase as the condition of affairs improves.

The Spanish-American complications, and the possibility of war, have strengthened the gold premium, and the ease in money has led to more speculative transactions than have existed at any time since the panic commenced. The range of fluctuations has been between 108⅝ and 110½, closing at 110½ on Saturday night.

ST. NICHOLAS:

THE NEW MAGAZINE.

ST. NICHOLAS HAS COME AGAIN.

Here he is, more bright and beautiful than before—the Prince of all Magazines for Children. He has grown since last month in size and character. The first number delighted all the young folks. ST. NICHOLAS for December is still finer, and for January—ah! the Holiday Number—no boys and girls ever saw such a Magazine as that will be.

ST. NICHOLAS has the most beautiful pictures; it is full of sterling good reading-matter and hearty and innocent fun. It is to have two splendid Serial Stories—one for boys and the other for girls; and—well, we are not going to tell you anything more. It is for Sale by all the NEWS-DEALERS and BOOKSELLERS, who will gladly show it to you.

PRICE $3 a year; $1 for four months; 25 cents a number.

596 Broadway, New York.

The Nation.

NEW YORK, THURSDAY, DECEMBER 4, 1873.

The Week.

CONGRESS met on Monday, and proceeded to the choice of Speaker. Mr. J. G. Blaine was of course elected. The Democrats, with all their accustomed profligacy and contempt for public opinion, supported Mr. Fernando Wood for the position, notwithstanding that gentleman's prominence as a "back-pay thief." The Republican members immediately held a caucus, and determined upon the repeal of the back-pay act. General Butler, who has generally been supposed to be in favor of back-pay, proved that this was an injustice by proposing that an act should be passed authorizing suits at law for the recovery of the pay already received. This, however, was thought unnecessary. So that the session opens ominously for the Party of Hate, and radiantly for the Party of Progress and Human Rights.

The President in his message reviews the condition of foreign affairs, and finds them on the whole in a satisfactory condition; renews his recommendation for a commission to distribute the *Alabama* award; invites Congress to work out and define when and how expatriation can be accomplished, to regulate by law the condition of American women marrying foreigners, and to fix the status of children born in a foreign country of American parents residing more or less permanently abroad; recites the history of the *Virginius* case, but does not submit the diplomatic correspondence for the consideration of Congress, as it was conducted by cipher and by Cable, and needs "the verification of the actual text" before this can be done. He has meanwhile "authorized the Secretary of the Navy to put our navy on a war footing, to the extent at least of the entire annual appropriation for that branch of the service, trusting to Congress and the public opinion of the American people to justify my action." He suggests two minor Constitutional Amendments. With regard to Government finances, the President expects a falling-off of the revenues and increase of expenditures, and recommends economy to Congress; refers to the panic, which he thinks may perhaps yet prove "a blessing in disguise"; thinks that permanent prosperity is impossible until a specie basis is reached, and that a specie basis cannot be reached until trade is in such a condition as to leave us an "appreciable accumulation of the precious metals in the country from the products of our mines"; opposes inflation; thinks the National Banks ought to be prevented from paying interest on deposits, and says that "elasticity in our monetary system, therefore, is the object to be attained first, and next to that, as far as possible, a prevention of the use of other people's money in stock and other species of speculation"; recommends the creation of clearing-houses, and makes some suggestions looking to "elasticity," clearing-houses, and free banking; refers to the increase of American shipping; makes one or two minor recommendations as to "cheap transportation"; thinks the involuntary clauses of the Bankrupt Law, so far as they cover non-fraudulent cases, ought to be repealed; recommends aid to the District of Columbia, more civil-service rules, general amnesty, and a new civil-rights act.

Secretary Richardson reports the receipts and expenditures for the fiscal year, and declares that the receipts have fallen off, owing to the reduction of taxation. Estimates of those for the coming year he does not venture to make. He reports that $84,500,000 of the new five per cent. loan have been taken, and that the whole amount of funding done since the passage of the act has been, or will have been when these subscriptions mature, $300,000,000, reducing the annual interest charge $3,000,000. The only portion of the report containing anything very interesting is his account of the part played by the Treasury in the panic. He says that last summer, anticipating the autumn stringency, he sold gold while the market price was high; that when the pressure came he was urged to lend $20,000,000 in legal tenders to the New York banks, on pledge of Clearing-House certificates secured by collaterals, but refused to do so as contrary to law. He was also asked to buy exchange on London with Government money, but refused to do so. The New York Produce Exchange also asked him to lend currency to bankers to buy exchange, on receiving satisfactory evidence that the gold had been deposited against it in London, and to anticipate payment of the loan falling due January 1, 1874. He refused. The Charleston Chamber of Commerce also asked him to lend currency to be used in the purchase of exchange in New York, which he also refused to do. He reports that he bought bonds to the amount of $13,000,000, but ceased at this point, owing to the large amount offered. He condemns the payment of interest on deposits by the National Banks; recommends that "elasticity" be given to the currency, but leaves it "to the wisdom of Congress" to say how it is to be done, though he thinks a return to specie payments ought to be coupled with it; nevertheless, would have the banks allowed, under certain circumstances, to increase their note circulation by pledge of United States bonds; denounces any increase of the legal-tender circulation beyond $400,000,000 as a violation of public faith solemnly pledged; thinks that in order to return to specie payments "the volume of currency must be reduced or that of coin increased"; thinks the power of the Secretary over the $44,000,000 reserve should be accurately defined; likes the late slight increase in American shipping; and makes a number of minor recommendations with regard to the organization of the Custom-house.

The Secretary of the Interior reports the favorable progress of the Indian policy, and thinks that the practice of paying annuities to the Indians in money should cease, on account of the bad effects of money on the Indian character, and that they should hereafter be paid in goods; suggests that individual ownership be substituted for ownership in common as far as possible; with regard to the Modocs, says that it has been deemed best to remove the entire remnant of the tribe to this side of the Rocky Mountains, and to break up its tribal relations and divide the members among certain friendly Indians in the Southern Superintendency; invites the attention of Congress to the request of a body of Mennonites, who for several generations have resided in Southern Russia, that our land-laws may be modified to such an extent as will enable them to settle here and acquire and hold land in accordance with their own customs. He refers also to the "present unprotected condition of the Yellowstone National Park," and says that no appropriation has yet been made for opening it to the public under proper regulations; that the public now go there without any regulations, and carry off the mineral deposits and other curiosities; and that a superintendent was appointed in May, 1872, but, there being no appropriation, his services have necessarily been gratuitous, as "he could not be expected, under such circumstances, to reside permanently in the Park."

The Secretary of War puts the strength of the army on paper (the figures are given in a report by General Sherman) at 29,505 men; the effective force at 19,652. The Secretary of the Navy puts the navy at 63 steamers, carrying 826 guns; 29 sailing vessels, 322 guns; 48 iron-clads, 121 guns; and 25 tugs. Of this number, there are at present in commission 46 vessels, carrying 407 guns. The eight new sloops-of-war authorized by the last Congress are all building. Every effort is now being made to have the navy ready for war, should one occur, and the Secretary thinks that, "inadequate as this force may reasonably be deemed to the responsibilities

and pretensions of a Government like ours, and greatly at disadvantage as we certainly shall be, in respect of number and character of vessels, in a contest with the fleet of any respectable naval power," the Secretary believes that the "activity, skill, science, and experience" of our navy "will be found equal to any difficulty which courage dares to meet or energy will avail to conquer."

We believe the Chief-Justiceship was, contrary to the fond and foolish anticipations of the Boston *Advertiser*, offered to Mr. Conkling, and by him duly declined. He looks forward, we imagine, to a wider sphere of usefulness. His friends in the press declare that he is going to devote himself this winter to the currency question. We are very glad to hear it, only we fear that he will hardly have "got himself up" in it before the close of the session. If he *does* buckle down to the study of any subject of legislation, it will be the first time in his political career that he has done so, and the phenomenon will be watched by the people of this State with great interest. We must warn him, however, that study is monotonous and repulsive, and cannot compare in liveliness to stump-speaking and "managing." Mr. Williams, the Attorney-General, has got the vacant place. It is rather odd, it must be admitted, that the chief of a court which has to pass on the most complicated controversies of a great commercial country, should be chosen from the bar of a frontier State like Oregon, whose practice is mainly created by the simple disputes of a rude and sparse population of farmers. But Mr. Williams, if not able and learned, is laborious, painstaking, and respectable, and, as things go, his appointment will create a feeling of relief.

There has been another terrific disaster at sea—the *Ville du Havre*, a splendid steamer of the French line, having been cut down to the water's edge by collision with a sailing vessel in mid-ocean, on a clear, starlight night. Two hundred and twenty lives are reported lost. Who was to blame is not known at this writing, and perhaps may never be. The officer in charge of the deck when the accident occurred has been drowned. The captain was in bed, but remained with the ship until she sank, and was picked up out of the water. The presumption in such cases is naturally against the steamer, which is bound to make way for a sailing vessel, but this rests on another presumption, that the sailing vessel keeps a proper lookout. We shall know more about the matter, however, by-and-by. The year has been terribly prolific in these calamities at sea, and the worst of them is that they all seem to show that science has run ahead of morals in the matter of navigation. All that the skilful use of natural laws can do for safety in sea travelling has apparently been done. We have now hulls and machinery which winds and waves assail in vain, compasses almost incapable of deception, and lifeboats as big and more seaworthy than the ships in which the early discoverers crossed the ocean. We do not *watch*, however, apparently as well as we invent and construct. The two ships which went ashore last summer were hurled on the rocks because men were sleepy and careless. We suspect that, when we know the whole story of this last wreck, we shall find that somebody who ought to have been wide awake was taking a nap or "trusting to luck." The same tendency to sluggishness shows itself in nearly every department of activity. Vigilance is a declining virtue, and, whether it be war or finance or navigation, we all hope that somehow we shall "pull through" without taking some troublesome or disagreeable or costly precaution. There never was a time when the duty of "keeping our weather-eye open" was more neglected.

We were a little premature in saying last Thursday that Tweed was at that moment in the Penitentiary. He was not removed to that institution until Saturday, and probably would not have been removed then if the Sheriff had not been filliped into promptness by a stern and threatening remonstrance from Attorney-General Barlow. Tweed was allowed three days at the Tombs to transfer his property and settle his affairs—which, though in the case of most criminals a humane and reasonable custom, irritated people a good deal in Tweed's case, owing to the general belief that his property consisted mainly of "swag." At Blackwell's Island he has passed into the regular machine of punishment, wears convict clothes and eats convict fare. His present condition must be a subject of hearty satisfaction to all friends of good morals and good government, and nevertheless he will attract more or less of the pity which people are apt to feel for an old man overtaken by a punishment which he cannot hope to outlive, and which the community in which he acted for many years encouraged him not to expect. He gave the finishing touch to the comic element in politics by registering himself at the Penitentiary as "a statesman."

Judge Davis worthily closed the proceedings in Tweed's case by a stern lecture to the three lawyers who tried to intimidate him at the beginning of the trial by the presentation of formal imputations on his impartiality, and inflicted on them a fine of $250 each—a mild, but perhaps adequate punishment. One of the trio, Graham, was an old offender, who has long figured in criminal trials as an uproarious and weeping bully, and has apparently relied largely on his turbulence and disorder to divert the attention of juries from the real matter in hand. If it had been possible to single him out for severer chastisement, the good work would have been nearly completed. We trust the applause which has followed Judge Davis all through this case will encourage other judges to cast aside the timidity of these latter years and do something for the lawful correction of "the manners and excesses" of the bar.

The Chamber of Commerce of this city have under consideration a series of resolutions in favor of a return to specie payments. On the 6th instant, these resolutions were referred to a committee, consisting of Messrs. A. A. Low, George Opdyke, and Samuel Babcock. Messrs. Low and Babcock have made a report, in the shape of a memorial to Congress, representing that the time has come when a just regard to the commercial and financial interests and the honor of the country demands a return to specie payments, or the initiation of such measures as will lead to resumption at an early day; that gold or silver is in the commercial countries of the world the accepted standard of value; that gold is still, in the United States, money for various enumerated purposes—*e.g.*, the payment of duties; and that its constantly fluctuating price enters into almost every commercial transaction, and is a constant source of trouble and loss, and causes speculation; that to this speculation is in part due the very premium which stands in the way of resumption; that "for all the uses above-named, with one exception, gold coin would cease to be a necessity in the event of resumption, as all the national currency would stand on the same plane. For the single purpose of liquidating the balance of our foreign trade, from time to time, the use of gold coin would be indispensable; and it may be remarked that what appears in our export tables as bullion for the last year, has consisted most largely of gold and silver bars"; and that it follows from these considerations that the only thing that need be taken into the account in determining the feasibility of resumption, is the condition of the balance of trade with foreign countries. The amount of gold required to liquidate this balance is constantly declining, owing to the increase of exports, and the committee therefore recommends, 1st, that the United States stop purchasing bonds; 2d, that redemption of legal tenders be begun on the 4th day of May at New York, or other places also, if convenient, but that the power of reissue be continued; 3d, that some of the greenbacks be funded, if the condition of the currency, after resumption, seems to make that necessary; and that the National Banking Law be amended, 1st, by a provision that the 25 per cent. bank reserve be altogether in legal tenders; 2d, by a provision for the substitution of gold for greenbacks as a part of the reserve, whenever the success of redemption is fully assured. Mr. Opdyke has made a minority report in favor of the 3.65 convertible-bond plan, but the majority report has been adopted by the Chamber.

Last week was effected the final breach in the Hoosac Tunnel, which united the east and west headings, and thus virtually completed the second longest tunnel in the world. The distance pierced is nearly five miles; the Mont Cenis tunnel is half as long again, and occupied but a fraction of the twenty years required for the construction of the Hoosac. The natural difficulties, however, were at least as great in the latter case as in the former, the engineering quite as creditable; indeed, the alignment of the Hoosac was simply perfect. The success of the sub-Alpine tunnel, of course, was a great encouragement to the Massachusetts enterprise in its later stages, and but for the Italian example of rock-boring by machinery the older work would probably still be far from completion. The tenacity with which the State has clung to the project through all manner of adversity, is proof of a deep conviction of the necessity of the tunnel, and this will doubtless be fully justified. The actual cost of opening the tunnel (about ten million dollars) is greater than it might have been under other circumstances, yet hardly seems extravagant in itself, and still less so as the price of Massachusetts' maintaining her commercial rank in the Union. The State reluctantly assumed the task of a private corporation, to which it had originally loaned its credit. More than once the tunnel has loomed up as a great job in Massachusetts politics, and produced wide diversity and much bitterness of sentiment. Apparently, it is still to afford a basis for party differences, as the State's future relation to it remains undetermined.

M. Magne, the French Minister of Finance, has made his report to the Assembly, and a melancholy document it is. The total cost of the war, including everything, he estimates at $1,484,000,000, or more than half our national debt, and it must be remembered that it was all incurred in a single year. The expenditure of 1874 will, it is calculated, be about $540,500,000, or 43 per cent. more than in 1869, the year before the war, and this is only a rough estimate after all. What aggravates the situation is that the loan of over $300,000,000 made by the Bank of France to the Government during the war, compelled that establishment to suspend specie payments, and this sum must be paid back before it can resume. The revenue for the coming year is only estimated at $470,000,000, so there will be a heavy deficit; and this M. Magne proposes to meet by increased taxes on salt and sugar, and stamp duties, new or increased, on deeds, bills, and checks.

In the new Prussian Parliament, everything is likely to go as well as Bismarck could possibly desire. Liberalism in politics and religion has everywhere carried the day in the late elections. The numbers of the "Moderate Liberals" (the French Left Centre) have risen from 116 to 178. The Advanced Liberals (the Left) have risen from 50 to 71. The Moderate Conservatives (Right Centre), who vote with the Government on the ecclesiastical question, number 62, giving the Cabinet a majority of 311 out of a total of 432. The Conservatives (the Right), the old Junker party, have dwindled down from 69 to 9; the Ultramontanes proper have risen from 60 to 82; the remainder of the Opposition is made up of 17 Poles, who have neither lost nor gained, and 3 "Particularists," or States-Rights men—making in all 111. Besides these, there are ten independent members, or "savages" (*Wilden*), as they are called, who fight under no banner in particular, but generally support the Government on the church question. This question appears to have constituted almost the only issue at the elections, and it is their votes on this, in the last Parliament, which have caused the Conservatives to be almost swept out of existence, and have cut the Moderate Conservatives down from 84 to 62. The Danes have not held their own, but the Poles have, and the three "Particularists" include only one Protestant.

Strengthened in this way, the Government is likely to push on its warfare with the church more vigorously than ever. A bill providing for civil marriages, in order to get rid of the difficulty created by the absence of priests in about one hundred parishes, is one of the promised measures of the coming session. Another bill is to be introduced empowering the Government to remove from their old places of abode, or even banish from the country, such deposed priests as it may consider mischievous The proceedings against Archbishop Ledochowski have resulted in his removal from office and imprisonment. The Bishop of Trèves is likely to catch it for appointing clergymen without Government approval. The Bishop of Paderborn was sued by his chaplain for unjustifiable removal from office, but the bishop scornfully refused to answer, whereupon the police entered his palace, and took from his papers, for the use of the court, all that bore on the controversy. The Archbishop of Cologne has been so much frightened that he has stopped the sale of his official organ, in which he prints his excommunications, and only circulates it privately among the clergy; and the Archbishop of Breslau has humbly asked the approval of the civil authorities for his appointment of an assistant priest in his diocese. Nor is the warfare against the church confined to Prussia. In Hesse, a court composed of Catholic judges has just dismissed the suit of the local bishop against a Protestant clergyman for publishing a statement that the 'Moral Compendium' used in the Catholic divinity schools taught the morality of scoundrels. The Parliament of Brunswick, thanking the Emperor for his letter to the Pope, denounces the latter as an enemy of Christianity, bent on the enslavement of mankind. Worse still, the Austrian Minister of Public Instruction is introducing into the Reichsrath a set of bills for the regulation of ecclesiastical education and other church matters, modelled on those of Prussia, which has called forth, as a sort of protest against them, the publication of a letter denouncing the Prussian legislation, written in June last by Cardinal Rauscher, the Archbishop of Vienna.

The bill legalizing or making obligatory civil marriages—we do not yet know which it is—has more importance than appears on the surface. At present, every Prussian marriage has to be celebrated by a clergyman. There is no choice in the matter. More than this, every Prussian has to be baptized, whether he likes it or not. We hear of no change in the law with regard to the latter obligation, but presume it cannot long survive the abolition of the former one. The same thing may be said of the obligation to be buried in denominational cemeteries, of which the registries are kept by clergymen. At present, there are no others. There was considerable difficulty in obtaining the Emperor's consent to the institution of civil marriages, but it was at last extracted, and it will operate, it is thought, as the first step towards a total separation between church and state, which is what the advanced Liberals already demand. It will, too, release the sceptical element in the German population—which includes the great bulk of the educated classes—from what they have considered a most galling relation to the clergy.

The Austrian Empire has also just had its elections for the Reichsrath, which contains 353 members, who are now elected directly by universal suffrage, and not, as formerly, by the diets of the different provinces. The only great party line in Austrian politics is that between the friends of a strong central government and those of provincial independence, and the former have a majority of 228, though this does not, any more than in Prussia, give the Government a compact majority. The great question in Austria to-day, as here, is the financial question. Vienna is still prostrated by the languor and despair resulting from the panic of last spring, and the only hope of recovery seems to be in Government aid. Prussia recently offered the Viennese Treasury a loan of 200,000,000 thalers in silver, of which it has no longer any need, to enable it to resume specie payments, but this was, after consideration, declined, though it is now again talked of. Prussia, since she adopted the gold standard, has more silver than she knows what to do with, and finds the irredeemable paper of Austria a serious hindrance to commercial intercourse.

HOW SHOULD WE FIGHT SPAIN?

THE settlement of the *Virginius* affair, as reported from Washington, leaves little to be desired if the Madrid Government proves able to carry it into execution. Arbitration, or rather the decision of a mixed tribunal, is perhaps as good a way as could be desired of deciding whether the *Virginius* was a *bona-fide* American ship. If, however, it should prove that her papers were regular, and her owners really American, we shall at once be brought face to face with the question of our responsibility for her acts. And if it should appear, as is most likely, that she was a notorious filibuster, it will not be difficult for the Spaniards to make some very unpleasant demands on us, which we shall find it very difficult, under the Geneva rulings, to gainsay. If, on the other hand, her assumption of the American flag turns out to be fraudulent, and her designs against Cuba hostile, we shall have nothing to complain of beyond the summary execution of American citizens; and as this took place under a familiar Spanish custom, the most we can hope for is what the Government has demanded—the pecuniary provision out of the Spanish exchequer for the survivors. On the whole, we could not perhaps have hoped to reach any more satisfactory result than that actually attained, and Mr. Fish may fairly consider it another feather in his cap.

But while we are bound, if only on the principle that all is well that ends well, to give the Government all possible credit for the conduct of the negotiations, it is proper, for the benefit of the Congress which has just met, to call attention to the fact that we have been playing a very dangerous game, which might have placed us in a very embarrassing situation. We have made peremptory demands for satisfaction for an insult on a nation by no means blessed with wisdom, and just now in a very wild and irritable frame of mind, and have allowed a few days only for their consideration, and have backed them by an open threat of war in case of non-compliance by a certain day. Now there ought to be, as every one will admit, a certain relation between our diplomatic tone and our means of offence and defence. A nation may regulate its demeanor towards foreign powers either by Quaker principles or by feudal—that is to say, military—principles. It may adopt a policy of patience and long-suffering, and may rely wholly or in great part for redress of injuries on argument, or in appeals to the conscience or to the opinion of the civilized world; or it may adopt a policy based on the feudal theory of "honor," or, in other words, the theory that in all disputes it is itself the sole and best judge of the extent of the injury received and of the nature of the atonement to be exacted, and that self-respect requires a prompt resort to force for the redress of wrongs. A nation which adopts the former of these policies can of course dispense with the maintenance of an army or navy. Even if the worst comes to the worst, and it is compelled to seek redress at the cannon's mouth, it is bound to spend so much time in discussion that it will be able to raise an army or equip a fleet before it is necessary to come to blows. We did adopt this policy towards England in the *Alabama* controversy. The wrongs complained of were committed in 1862. We waited patiently for redress until 1870, and declared even then that we were ready to wait for an indefinite period, and that time and the general course of events were all the while demonstrating the justice of our demands. Under this precedent, the dissolution of our navy, and our indifference to the progress made in Europe in the construction of ships' armor and marine artillery, were reasonable enough. Nobody, it was said, wanted war with England, and, considering what England had done, it was *à fortiori* improbable that we should ever need to go to war with anybody without three or four years' notice.

A nation which adopts the latter policy, as France does and Prussia, for instance, is bound to be always ready to fight. It must have its ships of war afloat, and they must be of the most improved kind; it must have its soldiers and sailors trained and armed in the best manner, so that when it finds its honor hurt it can strike swiftly and destructively. It must, in short, do as gentlemen did in the days when disputes were not carried into the police court—keep its sword constantly by its side. If it is proud, punctilious, touchy, it must, in order to avoid being ridiculous or getting into very bad scrapes, have constantly at hand the means of making its anger dreaded. In short, if we cultivate the military temper, we must cultivate military methods.

Now, in this Spanish embroglio we have acted on the latter policy. We have laid aside the philosophic air with which we pushed the *Alabama* negotiations, and taken the tone of peremptory indignation. We do not say this was not the best tone to take; in fact, we incline to believe that in the existing condition of Spanish affairs and of the Spanish mind it was the only tone to take, if we meant to look for redress at all, or prevent similar outrages in future. We are, therefore, not criticising the Government about it. But we wish to call the attention of Congress and the public to the enormous dangers to which, through their stupidity or indifference, this policy has exposed us. Mr. Fish has actually been threatening to fight a maritime power of considerable force, and to wrest from it an island, upon a few weeks' notice, without having anything that can be called a navy at his command. In our day, nothing is a navy but iron-clads. Everybody knows this. The huge wooden screws which we send cruising round the world with so much pomp and pride, to protect our interests in foreign lands, and which are paraded in newspapers as terrible engines of war, are almost useless for military purposes. They belong to a class of ships which other governments have sold or are selling for firewood. In a naval action with modern men-of-war they would be sent to the bottom in five minutes. In a war with Spain, therefore, we should, in the absence of iron-clads, be driven immediately from the sea, and could only protect our ports by the use of torpedoes. Have we any iron-clads? We have a few. Of one of the best of them a naval officer remarked, with unconscious humor, in Washington the other day, that "he had no doubt she could be got to Cuba in calm weather." There is not among them a sea-going vessel, fit to contend with the Spanish frigates. Here is what happened to one of the best of them when she tried to make her way down the coast the other day in tow of one of the wooden screws:

"U. S. STEAMER POWHATAN, via LEWES, Del., Nov. 28.

"After we passed the Capes of the Delaware on Wednesday night, the monitor *Manhattan* did very well in tow, the weather being favorable, until yesterday morning, when a strong southwest wind sprung up, with occasional squalls. The sea swept clean over her from stem to stern, upsetting the men at the wheel and carrying away the log-book. The ventilators, with the exception of one, were all washed away. A leak was sprung under the turret, through which the water poured in with alarming rapidity. Commander Yates expected the monitor would go down, and ordered the boats to be cleared and life-buoys distributed. Shortly after 9 A.M., however, Capt. Beaumont having turned the *Powhatan* before the wind, the *Manhattan* became easier. This was off Chincoteague buoy. The monitor being in a leaky condition, and her bilge-pumps having become choked, while everything and everybody on board were thoroughly drenched, it was considered advisable to return to the Delaware breakwater, which we did about dark last night, the *Manhattan* going inside, while we remained outside. The *Manhattan* will probably be ordered to Philadelphia for repairs."

There is no reason to believe that any other monitor would, in like circumstances, fare one whit better, and in estimating the importance of this, it has to be borne in mind that to transport an army to Cuba, and supply it after it gets there, we must command the sea absolutely. As we now stand, unless the Spaniards should prove even more fatuous than they have yet shown themselves, it is hard to say where the fighting would be after we went to war. We could raise men enough to rid the island of the volunteers and regulars in a very few weeks, but how should we get at the volunteers and regulars?

An army, even when there are as many drilled soldiers and experienced officers in the country as we now have at command, takes some little time to equip and organize, but it is a very simple and easily prepared machine compared to a navy. A navy is the most costly, complicated weapon a nation can have. It takes years to construct it, and constant and elaborate care to keep it in a state of efficiency. If we deliberately make up our minds not to maintain one, however, we must also make up our minds to be very peaceful in our demeanor, and to bear insults and "outrages" and "dungeon" troubles patiently, and to give up the luxury of speedy vengeance, and to treat fiery patriots like Alexander H. Stephens,

who call for "war immediately if not sooner," as harmless lunatics. But there could hardly be a better illustration of the disappearance of foresight, judgment, and adult discretion and prudence among a certain class of our politicians, than the fact that one of the principal orators at the Cooper Institute "war meeting," a fortnight ago, was a member of Congress who has distinguished himself by his resistance to appropriations for the navy, and who two years ago made a desperate effort in the House to secure the extinction of the corps of marines. Nevertheless, on the occasion in question, he demanded war at once, and refused even to wait until Congress met. It will be found, too, by anybody who will take the trouble to watch Congressional proceedings, that the most blatantly bellicose members, the ones most jealous of the honor of the flag, most troubled about "the rights of American citizens," and readiest to hurl defiance at powerful foreign nations, and to encourage hostile expeditions directed against their territory, are the very men who most pertinaciously resist all rational preparation for war, such as the maintenance of an army or navy, experiments in gunnery, the support of schools for the training of officers, and the various other methods by which, as is now known to the civilized world, nations prepare themselves for fighting.

THE PENNSYLVANIA CONSTITUTIONAL CONVENTION VERSUS THE STATE OFFICERS.

AFTER having finished their projected draft of a constitution, the Pennsylvania convention passed an ordinance providing for its submission to the electors of the State for their approval or rejection. This ordinance, ignoring or disregarding the existing general statutes of the commonwealth, and even any particular statute which may have been passed in reference to the convention and its proceedings, contains a body of special rules touching the manner of conducting the election, the count of votes, and their return in the city of Philadelphia, and makes the convention itself, or a committee of it, a board of canvassers to examine the returns from the whole State. The object of this provision is well understood; in fact, it was openly proclaimed. Under the present constitution, legislative corruption had become notorious; the law-making power had for years been a mere instrument of advantage in the hands of private persons and corporations. Upon this foundation is built, not the supremacy of the Republican party, but the domination of the men who have obtained control of the machinery of the party. The proposed constitution, through its limitations upon the legislative power, which have been carefully prepared under the light furnished by a costly experience, and which are even more minute and peremptory than those contained in the latest constitution of Illinois, will destroy this stupendous evil. A result so much desired by all good citizens, and so necessary to the great commonwealth itself, is naturally dreaded by those persons who, obtaining and keeping power by means of the evil, seek to have it perpetuated. The word had therefore gone forth from the secret chambers of the Ring that the proposed constitution must be defeated at the polls; and the elections of the last few years make it clear that if the voting machinery of Philadelphia should be left in the hands which ordinarily manage it, an opposing majority adequate to the emergency could easily be returned from that city. Knowing these facts, the convention has undertaken to possess itself for the time being of this voting machinery, to supervise the election, to count the votes, and finally to examine the returns from the entire State. It thus seeks to ascertain the actual will of the electoral body, and to prevent the wholesale alteration of returns and falsifying of results which, in a representative government, is the most stupendous crime against society of which men can be guilty, more base and more dangerous even than treason. This action was not a scheme devised by one party to injure another, for the convention was decidedly Republican, and the ordinance received the assent of all the members except a few delegates from Philadelphia. The State officials, however, deny its validity, refuse to obey its directions, and are endeavoring to procure a decision of the courts pronouncing it null and void. That the convention's plan should be successful so far as its immediate objects are concerned, must be the wish of all who hope for the overthrow of organized political corruption; but it may be possible that with the best of motives and for a most laudable purpose, the convention has overstepped the bounds of its own authority in such a manner and to such an extent that the ultimate consequences may be more disastrous than the present evil which it desires to remove. Whether there has been any such excess of authority or not, whether the ordinance of the convention is valid or void, are questions which involve the very bases of our peculiar civil polity. No portion of the American political system is more obscure than the functions of the constitutional convention regarded as a part of the orderly administration of government, as an instrument for the peaceful and legal reconstruction of the fundamental law. A correct conception of the logical position of the convention, and of the nature of the process by which a State constitution is framed and adopted, is not a mere abstraction; its practical importance equals if not excels its scientific interest; and it alone furnishes an answer to the specific questions which we have just proposed.

There are three conditions under which the ordinance may have been passed: (1) the act of the legislature which called the convention may have provided in express terms that the constitution was to be submitted to a popular vote in such manner and under such regulations as the latter body should determine; or (2) the act may have been wholly silent on that particular subject; or (3) the act may have provided in express terms that the submission was to be in accordance with some existing election laws, or in accordance with some regulations then prescribed, or thereafter to be prescribed, by the legislature. Where the first condition exists, no doubt can arise; the ordinance of the convention, having received the express approval of the legislature itself, must be valid, for there is no other body whose assent or sanction could in any event be necessary. The second and third conditions present the only difficulty, but they must be considered together, as they depend upon one and the same principle. The question is, Has the constitutional convention any such legislative authority? If it has not, the failure of the regular legislature to act in the matter would not clothe it with the authority; if it has, the assumption of the legislature to act in the matter would not necessarily take away the authority. Under which of these three conditions the Pennsylvania case falls, it may be difficult to determine with absolute certainty. Section 5 of the originating statute provides that "the convention shall submit the amendments agreed to by it to the qualified voters of the State, for their adoption or rejection, at such time or times, *and in such manner, as the convention shall prescribe.*" Standing alone, this section would be decisive. But Section 6 goes on to say that "the election to decide for or against the adoption of the new constitution shall be conducted as the general elections of this commonwealth are now by law conducted," and contains some details as to the manner of making the returns by the "election judges" (inspectors), and of opening, counting, and publishing them "as the returns for governor are now by law counted and published." While we do not think that, upon a fair comparison of these two sections, the latter one so limits the comprehensive language of the former as to take the case out from the first of the above conditions, or as to conflict with the terms of the ordinance passed by the convention, yet we prefer to base our discussion upon general principles rather than upon the particular language of the statute. As a striking illustration of the vicious theory which we combat, which exalts the legislature and makes it supreme not only over the convention, but even over the people acting in their organic capacity in the matter of establishing a fundamental law for themselves, we refer, in passing, to another clause of this statute which enacts "that the said convention shall not create, establish, or submit any proposition for the establishment of a court or courts with exclusive equity jurisdiction."

If we refer to precedents, the result is instructive. Prior

1867, seventy-eight constitutions had been submitted to the people for their approval, and the convention itself ordered and regulated the manner of the submission in sixty-three instances out of this whole number. In about one-half of these instances, the action of the convention was prescribed either by the State constitution or by the originating statute, but in the other instances there was no such direction, and the convention assumed the authority to be lodged in itself as an essential element of its existence and functions. While these precedents are not absolutely decisive, they show very clearly the opinions which have generally prevailed. After some variations of method, but still through a steady progress towards the full conception of the plan, the following has been established as the normal process of calling a convention to revise a State constitution and of adopting the scheme it prepares: The legislature passes a statute submitting to the electors the question whether a convention shall be held, which statute frequently, and perhaps usually, contains provisions for an election of delegates and other details, in case the popular vote is in the affirmative. The proposition of the legislature being approved, delegates are elected, who assemble and draft a constitution. This is submitted to the electors, and, if approved, becomes the fundamental law of the commonwealth. Such, we say, is now the normal process, and beyond a doubt it will in time be universally followed. It is true that in some instances the legislature has called a convention without the previous assent of the people, and it may be that in a few States the constitution expressly authorizes such a course; but these cases are certainly exceptional. If a State constitution is silent upon the subject, it is universally conceded that the legislature may lawfully take the initiative in the manner described.

What are the functions of the body thus authorized and created? It is said by one school of political theorists that the convention is clothed with all the sovereignty possessed by the people of the State which it represents; that its powers are, therefore, for the time being, unlimited except by the restrictions of the national Constitution; and that, as a necessary consequence, its work might be imposed upon the commonwealth without the form of a submission to the popular vote. Although this extreme theory has never been carried out to its full results in actual practice, it has invariably influenced and modified the action of State conventions. We believe that it is erroneous, and degrades instead of exalting the attribute of sovereignty; But we have no space in which to discuss or combat it, and shall only refer our readers to the able treatise of Mr. Jameson, in which it is successfully overthrown. But while refusing to the convention the possession of absolute sovereignty, Mr. Jameson is carried —and unnecessarily carried—by his argument to the opposite extreme, and denies that it possesses any inherent powers whatsoever. He even reaches the conclusion that it differs in no essential element from any voluntary assembly of citizens met for a peaceful and proper object. The error which underlies his whole discussion is his notion that the convention derives its authority from the legislature, his assumption that the legislature possesses as a part of its ordinary functions any capacity in the matter of amending or originating a constitution. The legislature is clothed with all powers of ordinary law-making, except as restrained by the national and State constitutions, but among these is not that of remodelling the organic law. As the only possible representative of the State, it takes the initiative, and gives an opportunity for the people in their organic capacity and in a formal manner to call and choose an assembly of delegates; but when this act has been performed, when this opportunity has been given, its function is gone, and its control over the process of constitution-making is ended. The convention once chosen derives all its powers from the people —not from the individual electors, but from the organic people who constitute the State. To speak in the technical terms of logic, the statute is the occasion, the will of the people as shown by the electors is the cause. What is delegated to this body? We answer, not any absolute sovereignty, but the exercise of that sovereignty so far as may be necessary to accomplish a double purpose—(1) the framing a proposed constitution, and (2) the ascertaining in a formal and legal manner whether the people, through their constituted electors, will accept the proposed scheme and establish it as the fundamental law of the commonwealth. We concede that the convention does not possess the ordinary legislative function, that it cannot enact ordinary statutes, that it cannot invade the province of the government which exists by its side. It is not called into being to supplant, but to supplement the legislature, to do certain acts which are outside of, and to a certain extent antagonistic to, the proper business of the legislature. There is an evident incongruity in conferring upon the latter body the duty of working its own overthrow, by destroying the very foundation upon which it rests; and therefore the American system, through progressive steps, has finally contrived the convention as the sole depositary of this extraordinary power.

Constitution-framing and constitution-establishing are not branches of the legislative function, and as the notion, at first somewhat dimly conceived, has been gradually developed and perfected, the people have retained those fundamental processes of government in their own hands, entrusting the preliminary work to their direct agents chosen for that specific object, but reserving to themselves the final and absolute voice in the act of adoption. It is a mistake, in analyzing this perfected system, to regard the convention as a mere committee employed to prepare a scheme of government and submit the same to the legislature. Its report is to the people, who are its only superiors. The theory which we thus reject might easily render the revision of a State constitution impossible, except by a revolution, since the legislature, by a repeal of the statute calling the convention, or by a refusal to submit its work to the electors, could at any time defeat the popular will. A doctrine which leads to such necessary results is plainly opposed to the American principles of government and notions of legislative subordination. The true theory, on the other hand, avoids all possible conflict between the various departments of the government, and is in strict harmony with our conceptions of popular sovereignty and of the law-making function. The constitutional convention exists for a definite purpose, and has such powers as enable it to accomplish that purpose independent of any other delegated body, and accountable to no one but its own creator—the people. This ultimate purpose has been already stated, and it is unnecessary to enumerate the incidental and minor powers which are embraced within it. If we are correct in this position, it follows as a necessary consequence that the legislature has rightfully nothing to do with the submitting the proposed constitution to the people either in substance or form; that subject, transcending its legitimate authority, belongs solely to the convention. Undoubtedly, in a very few instances, the legislature has assumed exclusive control and the convention has acquiesced, but these exceptions do not affect the principle. If, however, a conflict should arise—as perhaps in Pennsylvania—between the ordinance of the convention and the statute of the legislature, the latter must give way.

We remark, in conclusion, that every modern constitutional convention has consciously and avowedly adopted the view which we maintain in opposition to that advocated by Mr. Jameson.

CHURCH DISCIPLINE.

THE decision arrived at by Mr. Beecher's church on Wednesday of last week, in reply to the remonstrance received from the two sister churches in Brooklyn on the subject of ecclesiastical discipline, if acquiesced in, as it is not unlikely to be, by a good many others, will make a much greater charge than appears on the surface in the relations of Presbyterian and Congregational church organizations to the community at large. The controversy in question arose out of the refusal of Plymouth Church to investigate serious charges made against one of its members still on its lists. Instead of doing so, it allowed him to withdraw from connection with it of his own accord, and simply dropped his name from its list. The two other Congregational churches in Brooklyn thereupon protested against this, as contrary to Congregational usage, and as likely to cause scandal and bring discredit on the denomination; and this protest, after full deliberation in Plymouth Church, was treated by a heavy

majority as of no weight or effect. The most important feature in the debate was, however, Mr. Beecher's speech, in which he laid down certain doctrines, which to most people will be new, but which the church adopted, touching the nature of the church organization. His view of his church is, in substance, that it is simply an assemblage of persons taking an interest in spiritual things and desirous of hearing him preach. But he holds that it has no jurisdiction either of offences against morality or of departures from orthodoxy; that its doors are "as wide as humanity for entrance," and "wide as necessity for departure"; that, in short, it is none of the church's business what a member's way of life is, and that enquiries into his morals and manners, with the view of making him the subject of ecclesiastical discipline, are simply futile and mischievous; that the object of the church is to give as much in the way of edification to those who take pews in it as they are capable of receiving, but not to exercise any supervision over their lives, or make curious enquiries into the relation of their practice to their professions. It is true, he says, that people of "scandalous" lives ought to be expelled, but this concession is of little use without a definition of the term scandalous. The lives of some of the Plymouth Church members have of late years certainly caused scandal, as the term is ordinarily used, and yet have met with no church censure. The effect of this theory will be twofold. It will of course, in the first place, do away at once, as far as the churches adopting it are concerned, with the practice of granting dismissory letters, or certificates of "good and regular standing," to retiring members, so as to secure them admission to other churches, because under it such certificates will mean nothing. In the second place, it will, as regards the community at large, act as a formal abandonment of the theory which has played so large a part in English and American history—that there is a real distinction displaying itself by outward marks between members of Congregational churches and the world outside. According to this theory, the church was composed of a body of persons who had not only embraced certain beliefs with regard to Christ's character and mission, but had, as a consequence or accompaniment of those beliefs, undergone certain changes of hopes, desires, tastes, and aims, implied in the term "conversion" or "change of heart," which created a real line of demarcation and a real difference of standards between them and their non-religious neighbors; and this change, and this alone, constituted fitness for participation in the sacrament of the Lord's Supper. The tests of the change were two in number, and the only possible tests, viz.: the convert's own account of his state of feeling and of his opinions on religious subjects, and his general conduct in the discharge of his various duties in life. One of these would not have been accepted without the other. Professions of faith would not have been accepted without amendment in action, or amendment in action without such an account of the motives to it as would satisfy the church that these motives were Christian—that is, had their root in certain recognizable views of Christ's character and mission.

It is hardly necessary to say that this was not and is not the Catholic or Anglican view of church-membership. To explain in detail why it was not would lead us into fields which it is none of our business to explore. But we may mention, as the chief reason, the fact that the Catholic and Anglican conception of the church is that of a body of clergymen, commissioned to preach, to baptize, marry, and bury the rest of the world; by whom, in the Anglican Church, the co-operation of the laity is accepted in a reluctant, half-hearted way, and in the Catholic Church not at all. In England, every man is, in law, a member of the national church, whatever his character or beliefs may be; and the tolerant view of what constitutes a Christian life which this has bred, has not unnaturally, though under widely different circumstances, been perpetuated by the Episcopal Church here. As regards the Catholic Church, it is a necessary deduction from its claims that all men are members of it. They may be bad or good, pious or unbelieving, but they are Catholics of some kind all the same, and whether they will or no. The bad behavior of a Catholic layman consequently reflects no discredit on the Catholic Church. It does not pretend to be an organization composed of repentant or believing persons. It is an organization of priests commissioned to teach religion and morality, and administer the sacraments, to everybody who can by hook or by crook be made amenable to their jurisdiction.

What we have been saying as to the Congregational Church is true, with some modifications, of the Presbyterian, Baptist, and Methodist churches. Membership is in them all held to be an outward and visible sign of an inward change, affecting not only opinions but conduct. The congregations are, in short, not simply audiences, but parts of an organization existing partly in this world, and partly in the world to come, and in the enjoyment of certain spiritual relations with God and Christ not partaken of by the world at large. The position taken by Plymouth Church, however, repudiates this theory *in toto*. What it says is that church members may or may not be Christians or good men; about that it does not concern itself. The one thing certain is that they like to come to the building on Sunday, and are strong in their devotion to philanthropic enterprises. In short, the church is not an institution. Its members are not held together by any visible bond. They are persons who like to expose themselves to spiritual influences, but have nothing to say as to the effect of these influences on their character.

Some one has said that this is putting the church on "a democratic basis," which is true; but then, it is by introducing into the church organization that feature of democracy which gives cause for a very large part of whatever apprehension exists as to the future of modern society. One of the greatest helps to conduct—which, as Matthew Arnold says, is three-fourths of life—in the ancient and mediæval world, was the close dependence of men on each other created by various artificial arrangements. Everybody was a member of some small organization, whose interests took his thoughts off himself, of whose honor he was jealous, and whose opinion stimulated him in any course of action which its code prescribed as best. He belonged to a small tribe, or state, or guild, or commune, or order, in which he was every day reminded of his dependence on his fellow-men, in which he lived under continual observation, which exacted of him continual sacrifice of self, and whose concentrated censure he dared not face. The result was that, in spite of barbarism and insecurity, great ideals were kept alive, and great types of character were produced in every age. In the modern world, all these have disappeared. The only organization the modern man belongs to is the nation, and when nations contain thirty millions of persons, each one's sense of obligation to it is apt to be very slight. Public men have ceased to be responsible to anybody but "the people," and the people is so vast and busy that responsibility to it is hardly more burdensome than responsibility to Posterity, or the True, or the Good. Public opinion, too, is expressed through so many organs, and is distracted by so many objects, and is made up of so many influences, that it is all but impossible to concentrate it with any force on any one man's deeds or misdeeds. Society every day comes nearer to a promiscuous crowd, each individual of whom supplies his own tests of conduct, and his own aims in life, and lets the others go their way. The one institution which has come down to our time as an artificial check on wrong-doing or stimulus to decent behavior, is the church as the Puritans set it up. It is (if we except the Quakers) the only organization which has professed to exact more than common decency of men engaged actively in the busy work of life, and exposed daily to its trials and temptations. It took the best moral opinion of the day, and brought it to a focus, so that it was felt, not simply by society at large, but by A and B, and opposed a practical and visible obstacle to their cheating and lying and licentiousness, by making the disgrace of it prompt and tangible. There is nobody who has fairly considered the temptations of our time but must regret deeply that the process of social disintegration which has already worked so much mischief, and has even attacked the family, should have reached religious organizations, and dissolved one of the most successful. What has occurred in Brooklyn will be taken, however, as a frank confession that what so many men of the world have maintained, is true—that church-membership was no guarantee of purity of character. Perhaps it was not; perhaps it was folly for any tribunal to sit on the condition of a man's heart; but this is hardly a reason for resolving itself into a simple public meeting. It might, if it cannot exact holiness, at least exact, and successfully exact, decency of life, by judging and casting out slanderers, cheats, forgers, blackmailers, adulterers, and peddlers of worthless securities. The Stock Exchange does something of this kind, and so do most clubs; can it be that we are about to witness a formal confession by religious bodies, not only that we are all sinners, but that in democratic communities one sinner is just as bad as another, and that the difference between robbery and petulance is not worth a Christian man's notice?

ENGLAND

LONDON, November 14, 1873.

WE are sick of this miserable Ashantee war before it has begun, and our only comfort is to know that, for better or for worse, it must be over and done with before next Easter. Lord Grey has contributed two depressing letters to the literature of West Africa, written in that vein of soured self-sufficiency and dyspeptic dissatisfaction which has characterized all the speeches of that noble veteran since he found himself consigned to the wax-work exhibition of old Whigs. Lord Grey desires to prove that all our troubles on the Gold Coast have arisen from the abandonment of the policy which he initiated but could not carry out. And what do you suppose this policy was to have been? The simplest matter in the world. The Governor of the Gold Coast settlements was to have founded a free confederation of Fantee and other adjacent tribes, under the quasi-protectorate of the British

flag, and to have taught these interesting pupils to live and flourish under a parliamentary system of their own, after the model of the British Constitution. There was to be no annexation of territory, and the protectorate was to be purely Platonic; but the Fantees and the rest of our allies were to be "advised" by agents of the British Governor, and taught to behave like good Christians and good Whigs. This admirable policy of Lord Grey's is unfortunately out of date, and no longer practicable in present circumstances. The first thing we have to do now is to thrash the Ashantees into submission, and then it will be time enough to consider the question—what next? You may be sure that we are more anxious to get out of a bad business than to extend our responsibilities in that quarter. Lord Derby's opinion, that "we have quite black men enough," will probably prevail. But I doubt whether Lord Kimberley will come very well out of the debate next session. The manner in which the Dutch settlements were taken over, and the withdrawal of the West Indian regiments without having ascertained the sentiments of the Ashantee King, and almost on the eve of a threatened insurrection of the annexed population, are points which can hardly escape animadversion, however speedily and victoriously the campaign may be disposed of.

The new law appointments are not yet completed. Sir John D. Coleridge accepts the Chief-Justiceship of the Common Pleas; he will preside over that court with grace and dignity, sum up and pass sentence with unexceptionable suavity, and wear his robes like one to the manner born. Mr. Henry James becomes *per saltum* Attorney-General; and it is said that Mr. Vernon Harcourt will be offered the Solicitor-Generalship. Should he accept it, he will bring to the post qualifications which his colleague does not possess, as a scientific jurist, a professor of ecclesiastical law, and an earnest law reformer. Having abandoned the parliamentary bar for a seat in the House of Commons, he had almost given up forensic practice, and was supposed to be looking rather to a political than a professional career. His success in the House of Commons has been considerable as a vigorous and powerful speaker, and a sarcastically independent critic of ministerial blunders and shortcomings. His seat at Oxford is, I fancy, almost if not absolutely safe, though the influence of his relatives at Nuneham goes against him. Even his acceptance of a law appointment would not perhaps disqualify him for taking political office in a future administration if he should prefer the Treasury to the Judicial Bench.

Mr. Fitzjames Stephen, whom the Government are very anxious to provide with a seat in the House of Commons, and who at this moment would be Attorney-General had he succeeded the other day as a candidate for Dundee, has been delivering a couple of lectures at Edinburgh on the defects of parliamentary government—a good topic for an unsuccessful candidate, but an odd argument for a lawyer who desires to be a legislator. Mr. Stephen was admirably fitted for the post of legal member of the Legislative Council at Calcutta, and he would make a most valuable law officer in a government charged with large measures of law reform. And he is so much more than a mere practising barrister who makes Parliament a half-way house to the Bench, that all law reformers would be glad to see him on the Bench engaged in administering justice under the new system which the Judicature Act will bring into operation. He is unquestionably a man of rare intellectual force and accomplishments, with enormous capacities and an insatiable appetite for the hardest and toughest work. It would be a pity that such faculties should not be utilized for the public good in England as they were in India, and no doubt his opportunity is soon to come.

The first edition of Mill's 'Autobiography' has been rapidly exhausted. The volume is found to be as readable as a romance. It is the absolutely truthful confession of a life-experience perhaps unique, and it is discussed in many circles as keenly as the last new religion or the last social scandal. Did you ever hear the story of Mill calling upon Carlyle to tell him that the MSS. of the first volume of the 'History of the French Revolution' had been used to light the fires by a servant in Mrs. Taylor's house? Mrs. Carlyle came down into the historian's study, and found him attempting to console the philosopher, who, with his face covered by his hands, was sobbing like a child. Mrs. Carlyle, not knowing the cause of this terrible grief, ran out to the gate where Mrs. Taylor was sitting in her carriage, and said to her, "I do hope, my dear, you have not left your husband." By the bye, a reviewer of the 'Autobiography' in the *Pall Mall* thinks it his duty to raise a protest, on behalf of society, against Mill's interpretation of that exceptional and decisive episode in his career.

Among the productions of the publishing season which has just begun, perhaps the most important is one which appears to-morrow. I refer to Mr. G. H. Lewes's first volume of the great work which has occupied his thoughts and engaged his researches during the past five-and-twenty years. The title he has given to the completed work is 'Problems of Life and Mind,' but the volume now published is only the first of three or even four, and its subject is "Foundations of a Creed." You know that Mr. Lewes was one of the earliest disciples and expounders of Auguste Comte's Positive philosophy in this country, and one of those disciples who parted company with his master when the latter erected his philosophical system into a hierarchical religion. In the 'Problems of Life and Mind,' traversing the border-land of physiology and psychology, and unfolding a new rule of faith and conduct, and a new conception of man's relation to the universe from which the supernatural is altogether excluded, Mr. Lewes strikes at the root of the conventional theologies; and perhaps one ought not to wonder that Mr. Blackwood, of Edinburgh, should have been so startled by a perusal of the proof-sheet of the first chapter as to beg his friend the author to excuse him from undertaking the responsibility of issuing it in the name of a Tory and orthodox firm. Mr. Trübner, the eminent publisher of Ludgate Hill, is not so readily frightened by heterodox opinions, and accepted the book gladly without an instant's hesitation. It is written in too severely scientific a spirit and purpose to be light or popular reading; and I need hardly add that it has all the clearness and the charm of style of which the biographer of Goethe has the secret, and that its perfect courage is never disfigured by a single word that can shock the most reverent of thinkers. Heterodoxy, however, to say the truth, is gaining ground every day in this country. In proof of this, let me point to the article on Strauss in the last *Edinburgh*; a passionate defence of the faith which, in order to save the ship, throws overboard the Book of Genesis, the law, the prophets, original sin, and the necessity of baptism to salvation.

The Roman Catholic Church appears to be unwilling to leave the defence of the faith in England in the hands of heretics. Dr. Newman some years ago asked the Pope for leave to found a college at Oxford. The site was bought and the building was planned, when the Pope changed his mind, withdrew his consent, and formally disapproved the project of mixed university education in a Protestant country. Dr. Newman retired to the Oratory at Edgebaston, near Birmingham, where he still presides as head-master over an excellent school, at which many of our aristocratic and middle-class Catholic youth have received a thoroughly manly English education and a sound classical training under accomplished tutors, some of whom are seceders from the Anglican Church. And now Dr. Newman's contemporary at Oxford, Archbishop Manning, under the express sanction of Pius the Ninth, is engaged in founding and organizing a distinct Roman Catholic university, to which the great Catholic colleges of Stonyhurst and Oscott will be affiliated, and at which the young Catholic noblemen and gentlemen will be trained to compete on equal terms in after-life with the graduates of Oxford and Cambridge. Archbishop Manning, you know, is an Ultramontane and Infallibilist to the core, and consequently in the highest favor at the Vatican. This separation of the youth of the two churches in England is according to the Syllabus, which condemns mixed education and mixed marriages. A few undergraduates, belonging to old Catholic families, are to be found at Oxford, both at Balliol and at Christ Church, in spite of the interdict. The establishment of this new university is a gigantic enterprise. The cost of the buildings alone will not be inconsiderable, and think of the endowments that will be required for exhibitions, scholarships, fellowships, and the professorate. It is not to be a theological university; the tutors are to be laymen, and most of the professors also; and the discipline is not to be semi-monastic, but such as befits young men who are going into a busy world. The Principal, of course, will be a priest, and Monsignor Capel, the famous and fashionable confessor and preacher, whom Mr. Disraeli introduced by an accident into the pages of 'Lothair,' and who did actually convert the Marquis of Bute, is designated, with the usual sagacity of the Vatican in such matters, to fill a post for which it would be impossible to choose a fitter or an abler candidate. Where the professors of natural science and moral philosophy are to come from remains to be seen; dogmatic theology and canon law and church history will take care of themselves. There can be no doubt that this university is designed to play a great part in that reconversion of England which is being continually prayed for at a thousand altars, and will probably be prayed for until the arrival of Lord Macaulay's New Zealander on London Bridge.

Notes.

WE are desired to remind the sculptors of the country of the existence and aims of the Fairmount Park Art Association. Fairmount Park is, as most of our readers are aware, the park of Philadelphia, and second to no other in the United States. The association just named, of which Mr. Anthony J. Drexel is President, and whose other officers and trustees are among the leading men of the city in wealth and public spirit, has a membership of over nine hundred persons. It is now in its third year, and has for its object to "contribute a statue, or some other work of art, for the adorn-

ment of Fairmount Park, at least once in every year." Already it has set up a life-size bronze figure of "Night," and a life-size "Group of Wolves," by Kemeys, also in bronze. It would commonly prefer to employ American talent in its commissions, though it does not choose thus to restrict itself. Any artist with a design to propose will be sure of attention, and may address Mr. John Bellangee Cox, Secretary, 723 Walnut Street, Philadelphia.——The Second Biennial Report of the Commissioners of Public Charities for the State of Illinois is accompanied by three colored statigraphic charts, a kind not often met with in our social statistics. The first two show to the eye, by means of figures constructed about a central axis, the distribution by age and sex of insanity, idiocy, blindness, and deaf-mutism in Illinois and in the United States for the years 1860 and 1870. From these it appears that, both in the larger and the smaller territory, more males than females are afflicted by these diseases, except in the case of insanity, where the females slightly preponderate. On the other hand, except in the case of deaf-mutism (for 1870), the ratio of afflicted is larger in Illinois than in the country generally—at least for the ages at which insanity, idiocy, etc., are most prevalent. The third chart exhibits, by means of circles, the aggregate number of the insane, etc., of the United States, according to the last census, by sex, color, and nativity.——The utility of some of the recent modes of permanent photography is well exhibited in 'Memoranda No. 15,' just issued by the U. S. Ordnance Department. The mode employed appears to be one of the forms of the Albert-type process, though whether Mr. Bierstadt's or Mr. Rockwood's we cannot determine. Here are some hundreds of views of as many different breech-loading arms, with all their parts detached and numbered, photographed on the same page with the printed text describing the parts. The most famous American and Continental arms are thus accurately represented (though not in every case with the same clearness as in a good mechanical wood-engraving); and this feature, to say nothing of the reports of experiments, makes the volume highly valuable for comparison and reference.——Roberts Bros. will publish in this country the 'Personal Recollections, from Early Life to Old Age,' of the late Mary Somerville.——A 'Life of Samuel Johnson, D.D.,' first president of Columbia College, and not unworthy of his name, is in the press of Hurd & Houghton. The author is Dr. E. E. Beardsley.——The recent change of ownership of the *Atlantic Monthly* is not, as some have thought, equivalent to a transfer to New York, and a consequent proof of the absorbing tendency of this metropolis. The editorship and literary corps remain exactly the same; the printing will still be done in Cambridge, though henceforth at the Riverside Press; and the publishers' imprint will put Boston at the front, and New York in the second place.——Shepard & Gill announce for immediate publication 'The Little People of God, and What the Poets have said of Them,' a collection of poems about children for the lovers of children, containing a new poem by Mr. Whittier, written expressly for the volume; also, a work by Rev. Dr. Lorimer, of Boston, called 'Under the Evergreens; or, A Night with St. Nicholas.'

—*Wilkes's Spirit* accuses us of "servile plagiarism" of its long review of the Rev. W. H. H. Murray's 'Perfect Horse'—a review which we now read for the first time, and which appeared in its issue of November 1, our own appearing on the 13th. It is enough to say that our notice had been in type at least a fortnight before it was printed, and had been composed exactly as it was printed at least three weeks in advance of publication. *Wilkes's Spirit* therefore behaves abominably in saying that "the *Nation* reviewer derived all his knowledge of the book and the subject from our columns.". The coincidences pointed out were owing to the fact that the errors were obvious to any one familiar with the subject.

—One aspect of the Tweed régime in this city has not had much attention, but it is of social importance, and ought to be well understood. It was never surprising to learn that a certain set of Tweed's friends had presented him with "a rich service of plate, beautifully ornamented with the arms of the Marquis of Tweeddale." The gentlemen who subscribed on such occasions knew all about the Boss, and did not know all about the Marquis of Tweeddale; and the plate which they were wise enough in their generation to buy they ornamented in the manner that seemed to them good, and everybody was satisfied—the Boss himself for one, and, for the others, the O'Briens, Creamers, Genets, Loews, Comans, Cardozos, Watsons, Mike Nortons, Hank Smiths, Tim Campbells, Oakey Halls, Bernard Smyths, Richard O'Gormans, and Edward J. Shandleys, who got offices, and, in due return for them, bought silver services, and set on foot associations for the purpose of erecting statues to their senator and supervisor. The names that we have just quoted are all to be found in a list of the officers and trustees of the Tweed Testimonial Association—a society formed some three years since, and which had "for its object the erection of a statue of Hon. William M. Tweed in consideration of his services to the Commonwealth of New York." Nothing else was to have been expected than that such names should have been found in such places. The strange thing was to know that the Ring of which these men were part and parcel should be able to secure the tacit or open support of men of character and respectability so high that the tameness of their acquiescence in Tweed and Sweeny's rule was the wonder of their neighbors and acquaintances. But the Ring's power in its various details was not comprehended by the public. It is only lately that there has been any public mention of one of Tweed's most potent means of coercion, and but a moment's consideration of one of the little-known weapons in his armory may probably bring about a reversal of judgment in numerous cases, to the real state of which no clue has hitherto been visible. The Ring was composed not merely of jolly, champagne-drinking club-men of the Americus Club, with "hearts as big as meeting-houses," as their friends used to say, and a fondness for clapping "the boys" on the back, and going with them to chowder parties; nor of good-natured, fighting politicians; nor of easy-going fellows who, because the public treasury lay invitingly open, naturally of course put in their hands—as who wouldn't?—but meant no great harm by it, and did nobody much hurt. Whenever the occasion called for cold-blooded cruelty, they could be as remorseless and as deliberately flinty-hearted as Jonathan Wild himself. For instance, one of the mainstays of their power is now said to have been their possession of the archives of the District Attorney's office. Most families have their secrets, of one kind and another, which it is desirable, for various reasons, that the general public should not know; and in a certain amount of cases some record of such secrets, involving a son, perhaps, or a cousin, a brother, an uncle, a wife, or what not, has found its way into the office of the public prosecutor, or, if not, can be made to find its way there. Armed with this means of inducing tractability, and employing it with native brutality and callousness to decency, it is no wonder if the Ring was able to enrol among its plate-buyers, statue-projectors, voters, legislators, and nominal friends and supporters, numbers of men who detested it as bitterly as ever did its most vigorous open assailants. In the nature of the case, there is an insurmountable difficulty about determining the extent to which this particular species of tyranny was employed; but that it was a great deal employed is asserted on good authority.

—The enormous convenience of decimal fractions, in computations great and small, makes it quite proper to honor duly the inventor of them. There has been no difficulty in recognizing him in Simon Stevin, of Bruges, whose tract published in 1585 was entitled the 'Disme.' Using circles in place of parentheses, he wrote 27.847 as 27 (0) 8 (1) 4 (2) 7 (3), and read it as 27 commencements, 8 primes, 4 seconds, 7 thirds. Dispute has arisen concerning the origin of the simpler notation by means of the decimal point, whether used before the fraction alone, or as separating it from the integer. Napier's claim to their discovery (as if the invention of logarithms were not glory enough for him) has been contested by De Morgan; but Mr. Glaisher, in a paper read before the mathematical section of the British Association, and since printed in *Nature* (Oct. 16), seems to establish his priority in introducing the decimal point into arithmetic. The full modern use of it, it is true, was first exemplified in a posthumous work of Napier's called 'Mirifici Logarithmorum Canonis Constructio,' edited by his son in 1619, where the formal definition of the decimal separator is given and illustrated, and the point subsequently used in operations as we now use it. Briggs, who died in 1631, constantly used an underscored line to distinguish the decimal part of a number; and Oughtred, one of his followers, improved on this by using, together with the line, a vertical bar to mark the separation still more clearly. "On the whole, therefore," says Mr. Glaisher, "it appears that both Napier and Briggs saw that a mere separation to distinguish integers from decimals was quite sufficient, without any exponential marks being attached to the latter; but that Napier used a simple point for the purpose, while Briggs employed a bent or curved line, for which in print he substituted merely a horizontal bar subscript to the decimals." It is further pointed out, as "not a little remarkable, that the first separator used (or, more strictly, one of the first two) should have been that which was finally adopted after a long period of disuse. All through the seventeenth century exponential marks seem to have been common."

—We recently called attention to a valuable article in the *Revue des Deux Mondes*, by A. Geffroy, upon the Germanic Conquest. Two other articles, of somewhat earlier date in the same periodical, will be of interest to those who follow the discussions upon the history of landed property. In the *Revue* of May 15, Prof. Fustel de Coulanges has one of his brilliant and instructive articles on "Landed Property in the Roman Empire and the Merovingian Period." He develops with great clearness the position which landed property held in Roman society, and his sketch of the colonial system is striking and novel. The discussion of the beneficiary system in that time is able, but he makes no reference to the great work of Roth upon

this subject, and does not seem even to be acquainted with it. This portion of the article is therefore of less value, for while his facts are not inconsistent with Roth's views, his theories are; and certainly these views must be either accepted or disproved by any one who undertakes to write upon the subject. In the *Revue* for June 1 is an article by Emile Laveleye upon the Allmends of Switzerland, a topic touched upon, but not exhausted, by Von Maurer in his works on the *Mark* system. M. Laveleye has done for the French what Mr. Maine has done for the English in popularizing the results of Von Maurer's investigations. Last year he had a series of articles in the *Revue* containing probably as good a general sketch of the subject as exists. The present article is in continuation of this subject; but the writer was especially drawn to it by practical considerations. In the well-balanced, conservative democracy of the Swiss cantons, he sees a possible remedy for the destructive shapes that radical democracy is prone to in more artificial communities. The early migrations of the Slavonic populations, which have been the subject of much controversy, have been ably treated in a treatise by Rösler, whose 'Romanische Studien' we noticed last year. He appears to have proved that, while their movement westward from their original seats on the Dnieper took place as early as the fifth century, they did not cross the Danube until the middle of the seventh; up to this time, the Greek Empire maintained that line. Among other points, he successfully attacks the alleged Slavonic origin of the Emperor Justinian.

—A curious collection, illustrating the Franco-German war from a literary and artistic point of view, is now to be seen in the Royal Library of Berlin. It was the accumulation of the Emperor, through gifts and purchases, and contains every accessible production of the press, of the pencil, and of photography, from German, French, English, American, and Italian sources, that was called forth by the war, or that can serve in any way to represent its passing phases. The Emperor has made over the collection to the Library, and, before being deposited in its permanent alcoves, it has been placed on exhibition as a whole in the main hall. First of all is the library of the war—rows upon rows of volumes upon its general history; upon the special history of the army; the history and achievements of particular regiments, battalions, detachments, corps; the official reports of battles and sieges; popular descriptions of the same, as, for instance, the war correspondence of the London *Daily News;* volumes upon Elsass and Lothringen; upon the sanitary work in the army; upon transportation, railways, signals, ballooning, telegraphy, and the chaplaincy. Then come poems and romances founded upon the war, biographical sketches, speeches, addresses, documents, collections of telegrams, bulletins, proclamations, etc. Next in order are complete sets of illustrated journals, conspicuous among which are *Harper's Weekly* and the London *Illustrated News.* Another department consists of maps, plans, pictures, photographs, etc., exhibiting all the phases of army-life—the march, the bivouac, the camp, the siege, the battle—and under these are innumerable photographs of persons, incidents, movements, which some occasion had made prominent. The most interesting feature of this collection, and one which will be of special value to the historian, is the French literature of the siege and of the Commune; the journals, the pamphlets, the sketches, the photographs, the caricatures, representing every phase of Parisian life during those memorable months, and giving a view of French politics and of French character even more vivid and more complete than that revealed by Bazaine's trial. The Emperor of Germany has been at much pains to collect all the caricatures of himself, and the rabid and even blasphemous diatribes upon himself and his army, in which French wit and hatred found vent during the war; and these he now deposits in the literary archives of Berlin as an episode of his reign. This whole collection forms a library of itself, and increases the demand for a commodious fire-proof library building, to contain the treasures now crowded into a wing of the royal palace at Berlin.

GEORGE GROTE.*

AUSTIN, Grote, and John Mill will live in literature as the representatives of the philosophic radicals. They all possessed the marked peculiarities and the equally remarkable virtues of their school. They were all strict utilitarians, strict sensationalists in philosophy, and political economists in politics. Their radicalism was not the offspring of ardent sentiment, nor grounded on any enthusiastic belief in the people, but was the result of their general philosophical theories. They all, therefore, consistently enough, in youth were the assailants of the established order of things, whilst advocating reforms, such as the amendments of the poor law, which were far more unpopular than the abuses which they assailed; and in advanced life showed in some respects a tendency towards a kind of conservatism, without sharing any of the admiration for the past or satisfaction with the present state of society which are ordinary characteristics of Tories. They all, again, had a certain similarity in the tone or color of their minds. Though avowed utilitarians, and, therefore, making happiness the end of life, they each betray a vein of feeling which has more similarity to stoicism than to the popular conception of epicureanism. They all, further, exhibited an amount and kind of pure disinterested public spirit which had very rarely been displayed by any school of philosophers or politicians. Each of them, further, extended the doctrines of their philosophy with marked success to different fields of thought. Austin revived the study of jurisprudence, Grote gave new life to the investigation of ancient history, and Mill applied to logic and political economy the doctrines which he had learnt from Bentham and his father. But though no three men of equal ability could easily be found who possessed more traits in common, it would be difficult to exaggerate the essential differences of their personal character; and it is very curious to note, now that in the case of two of them, at least, their private life has been laid more or less before the public, the way in which these differences told on the whole of their careers. If an observer looks at the intellectual results of their efforts, he will find it impossible to deny that they each of them achieved as great a success in promoting the spread of the doctrines in which they believed as any theorist can hope to achieve. But, except in the case of Grote, it is hard to look upon their lives as successful in the attainment of happiness. Austin lived under a sense of having failed to produce any effect on the world at all in proportion to the greatness and originality of his powers; was tormented through life by indignation at the folly and perversity "of the great confederacy of fools" in general, and of English lawyers in particular; and died too soon to see the brilliant result of his labors. Mill's life, as painted in his autobiography, was certainly not such an intellectual tragedy as that of Austin, and he must have died with the well-warranted conviction that he had not lived in vain. But his life has its side of sadness. His retirement to Avignon looks like an exile, and it is difficult not to feel that an incongruity between the man's dispositions and his philosophic creed made his existence at times rather a struggle than a triumph. The strongest impression left, on the other hand, by the annals of Grote's life is its completeness and absolute success as far as regarded the attainment of its objects. In the records of his early youth you could trace feelings of discontent or dissatisfaction. But on the death of his father he "found himself set free to act whatever part his choice might dictate," and, as his wife remarks, "in the mature period of his life George Grote followed the dictates of his own self-knowledge, and they directed him wisely." This sentence might, in fact, be the motto of his biography, for it strikes its key-note. The marked individual feature by which Grote is distinguished is the honesty, vigor, and firmness with which he followed the dictates of his own self-knowledge. It is impossible not to fancy that he derived something from his German ancestors. In everything he did, and still more what he avoided doing; in his slow, elaborate self-culture, in his utter absence of intellectual hurry, in his studious tastes, in his passion for music, as well as in his firm, tenacious, and, it must be added, intolerant adherence to opinions once adopted, it is at any rate easy to imagine that you trace the qualities of his grandfather from Bremen. His calmness and complete self-knowledge stand in curious contrast with some of the characteristics of his celebrated friends. No man had a more stern contempt for doctrines or views at variance with his principles; but one can hardly conceive that Grote could under any circumstances have let his life be fretted away by indignation at the folly of mankind. No man, again, strove to make his life conform more sincerely to certain principles, but it is hard to believe that Grote ever went through the sort of moral and intellectual crises which marked parts of Mill's career. His calmness and self-knowledge are the good side of some deficiencies in his character; for both Austin and Mill, if they had not all the strength of Grote, certainly were capable of entering into feelings which it may be suspected could hardly be realized by a man of his solid, quiet German temperament. But when the merits and defects of a character like Grote's are carefully weighed, few readers of his life will feel inclined to deny an abundant tribute of admiration to the man whose self-knowledge guided him with such singular wisdom.

In nothing does Grote's personal character appear to greater advantage than in his political career, though this was in one sense the least successful part of his life. He had, certainly, many qualifications for playing a distinguished part in politics. Though known to the world in 1832 as an extreme radical, he possessed at bottom a moderation of sentiment which is essential to a statesman. Any one who, in 1873, reads Grote's address to the electors of London will be surprised, not at the violence, but at the calmness of its tone. The address does not contain the slightest appeal to popular passion or, it may be

* 'The Personal Life of George Grote. Compiled from family documents, private memoranda, and original letters to and from various friends. By Mrs. Grote.' London: John Murray.

added, to popular sympathy. All the reforms which the radical banker advocates are of a matter-of-fact and somewhat prosaic character. He urges the importance of removing taxes on knowledge; of lightening taxation; of exchanging the corn-laws for a moderate fixed duty; of regulating the constitution of the East India Company; and of simplifying the law. He issues a programme which might have been, and perhaps was, written in the study of James Mill, and which is as dry and precise as the writings of the philosopher whose influence is traceable in every line of the address, just as it is traceable in every one of George Grote's opinions. Nor was he deficient in political foresight. Every one of the reforms advocated in his address have now been carried, and various instances occur in his biography of the soundness of his judgment about questions which could be decided by reference to the rules of plain common-sense. Thus, though a close friend of De Tocqueville, he pronounced, on the very day after the *coup d'état*, a judgment on De Tocqueville and his associates which is worth quoting for its sagacity and its application to the present condition of France:

"They have been helping, and even outrunning, the President for the last two years in crushing everything like public liberty and popular force. They have done this without seeing that the popular force formed the only security to themselves as against him, and that, as soon as they ceased to have a spirited and free-spoken political public under them, they were at the mercy of the executive power, even for their own personal safety. This is a terrible lesson which they are now taught when it is too late. Tocqueville and all the rest of them, in their intense fear and hatred of the Republican party, have been just acting in such a way as to prepare France for that military despotism which now menaces the country."

Mr. Grote also was, if not the orator which he appeared to his wife, certainly an efficient speaker. He was, moreover, well versed in business, and would have made a far more capable Chancellor of the Exchequer than any of the gentlemen whose financial blunders brought discredit on the Reform government. Mr. Grote would, in short, it may be conjectured, have displayed in office very much the qualities which distinguished his most intimate friend, Sir George Cornewall Lewis. In spite, however, of his possessing many of the characteristics which go to make up a statesman, Grote, in common with the party with which he associated, failed in achieving political success. The general causes of this failure are traced in Mill's 'Autobiography,' and do not here concern us. The virtues of the philosophical radicals hindered them quite as much as their defects, but it were vain to deny in the case either of Grote or of his friends the existence of faults almost fatal to the attainment of success in statesmanship. The weak, though no less than the strong, point of the whole party was that they were *doctrinaires*. They cared far more for their "doctrine" than for the feelings of the men to whom it was to be applied. It is manifest that Grote, at least, never possessed the talent of men such as Cobden or Bright for enlisting popular sympathy in favor of the reforms of which he was an advocate. The immense efforts he devoted to the introduction of the ballot are a proof that he attached an excessive importance to an almost mechanical improvement which, to a man of wider sympathies, could hardly have appeared a matter of supreme consequence. Nor did he or his associates exhibit, for the most part, any capacity for entering into a great number of widespread ideas which, sound or unsound, must be taken into account by a great statesman. The philosophical radicals never anticipated the influence which would be exercised by the principle of nationality. The so-called principle is in reality a sentiment, and could hardly be understood by men trained up to think that Mill's 'Analysis of the Phenomena of the Human Mind' gave an exhaustive description of human nature. The only trace we can see in Grote's biography of his interest in movements founded on this principle is that "he devoured the narratives of Garibaldi's exploits with eagerness." But even in this case he was clearly not much inclined to trust to a movement grounded on feelings for the improvement of mankind. "His practised intellect prompted him to entertain a distrust of any wholesome regeneration of the Italian people by political efforts of this kind, as long as the ascendancy of the Pope should continue." In this instance his intellectual coolness showed him dangers to Italian freedom which ardent Liberals have been too much inclined to overlook, as it also may have led him to reflect that the so-called principle of nationality might come into conflict with principles on which depend the existence both of freedom and good government. But the same disposition to underrate considerations of sentiment certainly blinded him with regard to the true nature of "secession." In 1862, he is struck with "the unreasonable and insane language of the Americans against England," and thinks that in dealing with America "the English Government and public, generally so meddlesome, have displayed most prudently commendable forbearance in spite of great temptations to the contrary." Nor did he ever feel that the South were bent on setting up a government opposed to all his most cherished convictions. It may be suggested, but we believe without ground, that Grote's later sentiments displayed a conservatism of advancing age. His views certainly underwent modifications, but he seems to have spoken the simple truth when he said in 1869, "The opinions of the so-called Radicals of the present day do not accurately represent those which I and my friends held thirty years ago, and which I continue to hold substantively." His political opinions were the result of certain general theories, and scarcely changed throughout his life; but he had never at any time strongly sympathized with popular sentiments. He was always a political theorist rather than a practical politician, and possessed neither the vices nor the virtues which are essential for pre-eminent success in parliamentary contests. He himself perceived that this was so. In 1841, he retired voluntarily from Parliament, and never attempted again to enter it. When, towards the end of his life, he was offered a peerage, he declined a position for which he wisely thought himself in some respects fitted, simply because he felt it would interfere with the discharge of other public duties. His retirement from politics was in itself a rare proof of calmness and self-knowledge. What, however, is even more remarkable is, that he never seems either to have expressed or to have felt any of that discontent or vexation which able men are apt enough to express when they are conscious of anything like failure. His interest in politics, as is shown by his essay on the affairs of Switzerland, and by his excitement at the revival of French liberty in 1869, remained as lively as ever. He withdrew from public life simply because he felt that his real vocation was rather that of a student than a statesman.

Of Grote's character as an historian this is scarcely the place to speak. An opportunity will occur of estimating his great services to the study of history when the more "qualified expositor" to whom Mrs. Grote refers, publishes an estimate of Grote's "intellectual achievements." The points to be here noticed with regard to his writings are noted simply because of their bearing on his personal character, and especially on that self-knowledge which we have singled out as its marked feature. The composition of the history was no idea taken up simply to console himself for a retreat from public life. The notion of writing the history of Greece may have been, as Mrs. Grote believes, suggested by herself in 1823, but long before that date he had become interested in the studies of which that work was the outcome. Nothing is more remarkable in the whole of the biography than the notes of Grote's elaborate and systematic studies when quite a young man and occupied in business. The following record of the reading of a day is a mere example of the continuous employment of Grote's time:

"Rose at 9; breakfasted and continued my thoughts of the evening preceding; Mr. Bury brought me Ricardo's pamphlets this day; dined at half-past five; played on the bass; read some more of Ricardo; his reply to Mr. Bosanquet, which is most able; locked up and drank tea, then spent the evening in going on with my thoughts, looking at some parts of Xenophon and Aristotle."

This specimen is really a sample of the whole of Grote's life, from youth to age. It was an active life combined with an existence of constant study. In this passage may be seen that combination of interest, both in modern political philosophy and in Greek literature, which gives a peculiar character to Grote's historical works. This and like passages also show that Grote, in giving up active politics, simply returned to the career which he had deliberately marked out for himself. The quotation, moreover, suggests another matter which ought fully to be considered in order to attain a full understanding both of his literary and public activity. Grote was, it is true, a student, but mere study, or the mere acquisition of knowledge, was never the aim of his life. He remained, from the time, at any rate, of his acquaintance with James Mill to the day of his death, a zealous Benthamite, anxious to propagate the tenets of his school. Whether writing history or writing metaphysics, Grote was equally bent on the service of mankind. He was, of course, a man of far too much grasp of intellect to indulge in the weakness of writing the history of a great country with a view to enforce a moral. But he certainly looked upon the exposition of sound views of history, and especially of sound historical criticism, as a means of educating the world in political and philosophical truth. The fact that Grote was throughout life bent on aiding the triumph of the truths or dogmas in which he firmly believed, explains several features of his life which perplex those who look upon him simply as an ardent student, and a man of great kindliness of heart, and unrivalled courtesy. It explains, for instance, the readiness with which he passed from the political annals of Greece to works on the doctrines of Plato and Aristotle. His latest writings will not add greatly to his fame, and many critics will be inclined to blame him for passing from historical studies to metaphysical speculations. The world probably lost something from his not devoting his later years to the elucidation of some portion of history. But the course Grote took was, at any rate, perfectly natural. He had always entertained an interest in history, chiefly because of the light which history appeared to him to throw upon moral and metaphysical speculations; and when he began to treat of the Greek philosophers, he was not

deserting his main field of study, but was exploring precisely that portion of it which seemed to him to require by far the most careful investigation. Many admirers of the historian, again, deplored his conduct with regard to the professorship of moral philosophy at the London University. We are not concerned either to defend or assail the part which he took in giving that professorship to an unknown man with whose views he agreed, instead of to a writer of high reputation, whose philosophical doctrines seemed to Mr. Grote to be grounded on error. All we would here point out is that his conduct, right or wrong, was in strict conformity with the principles of his life. Neither he nor any of his school were persons by any means tolerant of hostile doctrines. Grote's most ardent desire was to spread what he held to be the truth, and he did not entertain the least doubt that the truth meant in substance the doctrines of Bentham and James Mill. One of the anxieties of his later life was to fill professorships with teachers who would teach sound doctrine:

"I have," he writes to Mill, "gone through nearly as much anxiety of mind as I did when Bain's appointment was lying *ἐν γόνασιν* of Sir George Lewis. If Robertson proves worthy and effective (as everything leads me to hope), the gain for inductive and scientific mental philosophy will be most important. I am sorry to say that the younger generation—even those trained in University College and the University of London—appear to me to be of a cast essentially feebler and more prejudiced. It is melancholy to observe this when one has been laboring to improve education."

Part of Mill's reply is as follows:

"We must not forget that your experience and mine of the older set includes the very best of them—those who were formed under the Benthamic influence. There was in general Kimmerian darkness then beyond the region to which that influence directly or indirectly extended."

The letter and the answer mark out the exact position which Grote and his friends occupied in their own eyes. They were the survivors and representatives of heroes who had struggled in the battle between light and darkness. Tolerance was scarcely the virtue to be expected from soldiers engaged in such a contest. If they had some of the defects which a life of fighting engenders, they had also its appropriate virtues. Grote not only preserved his singular calmness of disposition, but combined with his equanimity an untiring energy, in which we suspect he had some reason for thinking the young generation deficient. To the very last days of his life he was devoted to the service of the London University. It might almost with truth be said that he shortened his existence through his labors on its behalf. His zeal for the public good becomes in a sense the more noble because his moderation of mind led him in his later years to be less hopeful of the effect of reforms than he had been in youth. When at last the measure to which he had devoted the exertions of his manhood was carried, he confessed that his belief in the ballot was less ardent than it had been:

"I have come to perceive that the choice between one man and another among the English people signifies less than I used formerly to think it did. Take a section of society, cut it through from top to bottom, and examine the composition of the successive layers; they are much alike throughout the scale. The opinions all based upon the same social instincts, never upon a clear or enlightened perception of *general* interest. . . . I believe, therefore, that the actual composition of Parliament represents with tolerable fidelity the British people; and it never will be better than it is, for a House of Commons cannot afford to be above its constituents in intelligence, knowledge, or patriotism."

A careful study, in short, of Grote's uniform and consistent career, both as a historian and as a public man, will make readers see something much more than a trite metaphor in the expressions of a friend, who told Mrs. Grote that Grote's intellectual course "always seems to me to resemble the progress of a planet through the firmament, never halting, never deviating from its onward course, steadfast to its appointed purpose." And any one who reflects on the inestimable value to a country of men upon whose firmness and honesty friends and opponents can alike depend, will feel the force, both as a compliment to Grote, and as a reflection on French society, of this passage contained in a letter from Mrs. Austin, written from Paris just before the Revolution of 1848: "There are no *Mr. Grotes* here; take my word for that; and, least of all, among the so-called Liberals."

RECENT NOVELS.*

'THE Fair God,' by General Lew. Wallace, is an historical novel which has for its subject the first part of the conquest of Mexico by the Spaniards. The story is assumed to have been written in Spanish by Fernando de Alva, a man of the conquered nation, who was unwilling to have the glories of his country forgotten, and of whose long-lost manuscript 'The Fair God' is presented as a translation. It pictures to us the Aztec civilization just before the arrival of the Spaniards, and the fierce conflict between the two races—a conflict which was made easier to the European by means of the widely spread superstition that Queztal', "the fair god," the founder of all their greatness, whom they had banished, was to return from the East at about the time that Cortez and his men landed. Of this most dramatic chapter of modern history, the account is given from the Mexican side; we have put before us the intrigues of the different leaders, the life in the court, and also various love-affairs. As suits the subject, the book is extremely bloodthirsty. It is full of accounts of slaughterous fights, which are told with much enthusiasm.

That a great deal of pains has been expended on the setting of the story is evident—Mexican palaces are described at great length, and a general familiarity is shown with the life of that early time; and so far we may speak well of 'The Fair God.' As to the men and women who figure in its pages we shall not say so much. In fact, they do not impress us as remarkably living people, despite the quantity of killing they require. It is a maxim useful to remember, that an anachronism is the most pardonable error of which the historical novelist can be guilty. All the preparation in the world, accuracy in every detail, do no more towards making such novels good than real rain-water does towards making "King Lear" impressive. The first condition is to have men and women in the book; having got them, of course, the more gracefully and accurately they can be clad, the better it is. In the novels of the great originator of this sort of fiction, the armor of the knights, and the "by-'r-ladys" of their men-at-arms, the continual falling of portcullises, and the riding of palfreys, while it is the part that is most attractive in our salad days, all seems to the aged reader a good deal like a collection of theatrical properties, and yet he does not fail still to enjoy and be refreshed by the human nature which makes these romances so delightful. In 'The Fair God,' we must say we do not find much of this charm. The conversations, for instance, remind one of the somewhat sophistical tone of those noble dramas in which scene-painting and much dancing take the place of true dramatic effects. In short, the work is all done from the outside, and the result is a clever book which falls far short of being a good novel.

'The Son of the Organ-Grinder,' by Mme. Marie Sophie Schwartz, is a newly translated novel of rather more interest than most of her stories, so far as they are known to us. In the construction of the plot it is very similar to many German novels, while in the fluency with which it was apparently written we note a trait which distinguishes so many women who write novels; and there really is not much else to be said about it. To the side remarks of the author we must, however, award the merit of being perfectly true. For instance, no one will refuse assent to this exclamatory statement: "What a revolution in a person's life is produced through being suddenly changed from an itinerant child to the owner of a considerable fortune!" Nor is there here room for scepticism: "What a fever one is in when he has to pass his examination and does not yet know the result of it!" And this is of universal acceptance: "How strange life is! How completely ignorant we are of what the next moment may bring forth! We stop outside a door, we lay our hand on the knob, and we do not know until the door opens what we shall find within." The book is well-intentioned, but, as the intelligent reader already may have suspected, dull.

Dull, however, is not the word of blame which is demanded by 'Nina's Atonement'—a volume which takes its name from the first sketch, wherein a most dismal and appalling tragedy is told. It would seem that Nina, whose other name is Dalzell, is engaged to Ralph Wyverne, and that Ralph has a black-hearted friend, Martindale by name, who also falls in love with Nina, and who resolves to secure her hand. Being by profession a chemist, he expects to find it easy to effect this purpose. His method is the simple one of luring young Wyverne into a room filled with the fumes of a poisonous gas. But what is the result? The person who enters the fatal chamber is not Ralph; it is, on the contrary, Nina, who is instantly killed. Ralph, however, is balked of his vengeance; for, as it seems, Martindale had

"A glitter in his eye as ominous as the lurid glow that had come to Ralph's.

"'Do you think I will ask your leave when to die?' he demanded. Then he put his hand to his lips.

'Blanche Seymour. A Novel. By the Author of 'Erma's Engagement.'' Philadelphia: J. B. Lippincott & Co. 1873.

"Ralph made one quick, tiger-like spring forward; but he was too late. In the throat on which his fingers closed, the death-rattle had already sounded. With one mocking smile, the soul fled. That faint, subtle odor of bitter almonds which betrays the swiftest and deadliest poison known to chemistry, was all that remained to the baffled avenger"—

certainly but a slight consolation. The smell of prussic acid, at no time very gratifying, must under the circumstances have been simply annoying.

The other stories in the same volume are very much of the same sort, with beautiful heroines, large-eyed, mysterious heroes, and often with tragic terminations of the various love-affairs. The names of the characters indicate a nature which could only be at home in "manors" and the like. Indeed, we do not know why Helen Trefalden, Louise Cheriton, Powell Vardray, and Vance Lorimer, etc., should not have a large and luxuriously upholstered steamboat cabin. If our author could prune her imaginations into something resembling real life, she would do a good deed for herself, for she by no means lacks a certain quantity of merit.

Far different from such gilded scenes is Edward Garrett's 'Crooked Places.' This "story begins more than fifty years ago; and it commences in a quiet, dark room, with a young woman sitting at a window." It treats of the sufferings of the poverty-stricken, and of the consolations which right-doing brings them. The novel is far from being exciting; it is rather a meritorious Sunday-school story, a trifle more interesting than many of its congeners, because the veil of fiction is less transparent than is often the case in such stories.

'The Dead Marquise' is the ill-chosen title of a tale of the French Revolution. It is in reality a pleasing little love-story, prettily told, which has the advantage of escaping from being horrible. With that terrible background one has to be careful to keep tragedy from being too prominent, and this Mr. Kip has effected.

'Athol' is a production of our own great country. The heroine, Atholinda Derwent, sings her love for John Graeme, her cousin and guardian, after a fashion which is by no means rare in works of fiction. This is the sort of man John Graeme was:

"He was standing on the hearth-rug, in front of the grate fire, his riding-gloves and whip in hand, looking down at me in his grand Romanesque way, with his black hair tossed carelessly back—his heavy riding-cloak drooping from his broad shoulders. It gave me a great sense of vitality and vigor but to look at him, and by some mesmeric agency he imparted some of his life and strength to me when he was near."

John is older than Atholinda of course, and has a familiar habit of clasping her to his bosom, of smiling "his sarcastic smile, mocking and shimmering as sheet-lightning." This is when he is talking on "serious" matters. In short, there is no one who reads novels who has not become well acquainted with John in some of his forms, in any one of which he need only lean on a mantel-piece to fascinate completely the Atholindas who write novels. This story is no sillier than the others of the same kind, nor is it in any respect better. The plot is rather complicated, but the main point is the love-affair between the hero and the heroine, and there is in this so much "mesmerism," so many "fond kisses," such a getting engaged to the wrong man, that, on the whole, "M. R. H." had really better stop it. Her book is not too silly to do mischief, and "M. R. H.," like the rest of us, owes something to society.

'Brave Hearts' is another American novel of the present time, which gives us an account of life in the gold mines, with a judicious sprinkling of civilized society. We have set before us the gambler, without whom no true picture of this country could be drawn, and over and above such just measure we have the defaulting cashier—a delicate touch of realism on the part of the author for which we ought to thank him. The principal interest of the story lies in the way in which a little experience of life is shown to drive certain philosophic platitudes from the head of a young man just out of college. He goes to the West and falls in love with a young woman, meets with various adventures which are well told, and at last marries the girl of his heart—several of his neighbors and friends, whose fate is more or less bound up with his, also getting themselves married at about the same time. The best part of the book, we need hardly say, is that which gives us sketches of Western life, but certainly the "civilizers," as Walt Whitman calls them, would seem to be not extravagantly interesting people. Young people, however, will find this a tolerably entertaining novel; though their elders, whose taste in the matter of love-making demands something more complicated than propinquity, will not be so much entranced. As to the illustrations, it would be hard to say whether it is Mr. Stephens, Mr. Darley, Mr. Beard, or Mr. Kendrick who has done himself least credit.

A more serious attempt at novel-writing is Mr. Benedict's 'Miss Dorothy's Charge.' This gentleman is the author of 'Miss Van Kortland' and 'My Daughter Elinor,' as well as of several magazine stories and sketches. What is noticeable in 'Miss Dorothy's Charge' is its curious resemblance to ordinary novels, and its lack of any peculiar quality of its own. Nowhere is there a trace of plagiaristic intent, nor is there any page to which we could point as an imitation of any particular writer, but there is in it a general resemblance to hosts of novels rather than any especially lifelike trait in the characters or incident in the story. The heroine is the illegitimate child of an evil-doer, who, after breaking many hearts, marries for money a woman who avenges her sex most nobly. The heroine meanwhile is adopted by the rake's sister, Miss Dorothy, and under her care she grows up. Then she visits Europe with her father's legitimate daughter, and they both go into society with greater satisfaction than they could have done in their own land. They have various love-affairs, there is the disclosure that after all the first child was born in wedlock, but she throws the proof in the fire to save the fame of her friend, and they are both happily married. As may be seen, the plot of the story bears no strong resemblance to life, nor if it did would it have much effect in making the story appear natural. Everywhere it runs along at about the same degree of excellence, but everywhere it falls short of being really good; yet it escapes so many of the faults which disfigure works of fiction that it certainly should escape condemnation, and this negative merit it is that demands that 'Miss Dorothy's Charge' should be judged by higher standards. When this is done, the book appears to be an excellent imitation—written in good taste and with an intelligent appreciation of what goes to making life agreeable—of better novels, which have been studied from life itself, and not from the pages of other writers. As novels go, this one is fairly readable; we only regret that Mr. Benedict has not improved on his earlier work, and made it still more so.

A thoroughly readable novel, and one which may well be compared with Mr. Benedict's, is 'Blanche Seymour,' a reprint from the English edition. This is by no means a story which will be read and praised when Cervantes is forgotten; it is simply the story of the love of a young and charming girl for a man who was unworthy of her. It is not made a pretext for tragic denunciations of heartless men, nor of pathetic appeals for sympathy for neglected maidens; it is nothing more than a picture of a not uncommon life, which everywhere is agreeably set before us. The author's great merit consists in the commendable naturalness of all her characters. She is, too, very amusing with her side-remarks and the feminine cleverness which is to be seen on every page. In fact, except for the small tragic pang at the end of the book, which occurs at what is perhaps the only solution of the complication of the plot, we hardly know a more entertaining little volume than this.

CHILDRENS' HOLIDAY BOOKS.—II.*

THAT industrious statesman, Mr. Knatchbull-Hugessen, has another thick volume of stories ready for this Christmas, called 'Queer Folk.' As it resembles his previous ones in size, so it appears to do in merit. The 'Warlock of Coombe,' which contains a very animated battle-scene, will probably be as popular as anything he has written; and in none of the seven stories does there seem to be any falling off in inventive capacity. Our opinion as to his demerits, expressed very fully last year, remains unchanged; although the offences against decent and gentle manners seem to be fewer in number this time, they are unabated in quality. As, for example, in a scene supposed to be pathetic, where an old farmer discovers his only daughter to have been carried off by bandits, this sentence occurs: "Then he threw himself down on the ground in utter despair, which, as the spot he selected for this performance was the middle of the cow-yard, improved his personal appearance no more than it removed the cause of his sorrow." And this is followed by a pious appeal for "strength from Him," etc. If that is "humorous," we suppose this is too: Three beautiful girls are "condemned to be stripped and washed in hog-wash before all the court-ladies." Truly, this seems strong meat, even for British babes.

Mr. Knatchbull-Hugessen appears to have a rival in the field this year in the person of Mr. John Francis Maguire, M.P., who offers the child-public 'Young Prince Marigold, and Other Fairy Stories.' The one which gives its name to the book is the shortest and for the youngest readers, the remaining two being much more important. Of the innumerable animal biographies and autobiographies it has been our lot to read, Mr. Maguire's "Autobiography of a Cat" has about the most in it. These stories are not likely to reach the popularity they deserve among the young folks, on account of the "big words"—the style of language being entirely beyond most small readers. Grown-up people are evidently included in the audience, and much of the dry

* 'Queer Folk. Seven Stories by the Rt. Hon. E. H. Knatchbull-Hugessen, M.P., author of 'Stories for my Children,' 'Crackers for Christmas,' etc. Illustrated by S. E. Waller.' London and New York: Macmillan & Co.

'Young Prince Marigold, and Other Fairy Stories. By John Francis Maguire, M.P. Illustrated by S. E. Waller.' London and New York: Macmillan & Co.

'Child-World. By Gail Hamilton.' Boston: Shepard & Gill.

'The Three Judges: Story of the Men who beheaded their King. By Israel P. Warren. With an introduction by Rev. Leonard Bacon, D.D.' New York: Warren & Wyman.

humor that must be wholly lost on the children will be relished by the parents. It is a little difficult to do justice to these traits by single quotations, as they are mostly exhibited in the development of the characters. The king and queen of the monkeys are rather elaborately sketched; he is old, dignified, and uxorious, she young, handsome, and "skittish." "I regret to say she was too much in the habit of making over his royal highness [the baby prince] on his majesty, with whose public duties, more particularly those of ceremonial, the office of dry-nurse seriously interfered;" his "domestic clouds confirmed his tendency towards philosophy." "Jack Tubbs" is quite the most delightful fairy story we have come across in a long while. It will be impossible for most boys who love animals and sea-going stories as well as magic not to be pleased with Jack and his adventures. Moreover, Jack is humane and not brutal. The whole spirit of the book is good, even if a trifle ironical. Careful parents and guardians will want to go through it first to scratch out the epithets "nasty dirty," "nasty wicked," "nasty filthy," where they frequently occur.

'Child-World' deserves especial attention as being a thoroughly characteristic specimen of one kind of modern American "juvenile." The class of which it is a type is highly popular, widely sold, and without doubt is a potent factor in the moulding of mind at the tender age when impressions are strongest and even trifles are not trivial. The origin of this kind of writing is perhaps owing, as much as anything else, to the liberal reaction from the orthodox Sunday-school books—those stories of painfully and impossibly good and bad children, of which Mark Twain's 'Jacob Blivens' is a coarse but deserved satire. To depict children as they are in actual life was the natural and proper change from this sort of thing, and the tendency from that time on has been to make the pictures of them more and more realistic. That writer for the young who can present the most unmitigated photograph of any sort of boys and girls is the one whose works generally sell the best. Miss Edgeworth is out of date; her stories are not "truthful"—not "accurate representations of daily life as we see it." *Simple Susan* is unnaturally filial and unselfish, and *Francisco* unnaturally honest and industrious. Can any good result to children from teachings founded on such presentations of false character? This question is generally answered by the modern "juvenile" writer with a hearty negative—if not after process of thought, at least after process of imitation of the popular style. Gail Hamilton now enters this field, and, with her usual cleverness, "goes you one better" than the last veritable historian. To paint the "child-world" as it is, is plainly her intention—or, to be more exact, to paint the "child-world" as she has seen it. So we have precocity of language, a good deal of funny "baby-talk," some slang, a touch of swearing, plenty of natural naughtiness, little goodness but that resulting from natural impulses; docile papas and mammas who either rule by love or let ruling alone altogether; grown-up folks who use very big words and draw out funny retorts from the young ones. Nobody is unpleasantly disciplined; everybody is "smart," especially the writer. Her children can all "see through a millstone"; explanations or circumstantial descriptions are superfluous with the sharp little Yankee audience she intends to address. "Why draw these old-fashioned obvious 'morals'?" asks, in effect, this entertaining story-teller.

Let us give some illustrations of all these assertions. To begin with, here is a lesson for a very small child:

"Have you had a good visit, Lotte?" said Mrs. Meadows. "Can that chicken walk?" asked Lotte eagerly. "I asked you if you had had a good visit?" repeated Mrs. Meadows." "I want to see that chicken walk." "Then tell me if you had a good visit." "Let's see that chicken walk *fust!*" persisted Lotte. Mrs. Meadows *could not help laughing*, but she gratified her by putting the chicken in the chair, to show that he could walk, giving Lotte at the same time a little wholesome instruction, *which she probably forgot at the moment, even if she heard it*, so intent was she on the chicken.

Anybody who thinks we overrate a trifle in calling this a lesson, and a lesson in those bad manners which are so notorious of American children, can have had no experience of the plasticity of the youthful mind. Again, Gerty's father disapproved of her taking ether when she had her tooth out. "If Gerty had been a little girl, I do not hesitate to say she should have had the ether and welcome. *Pain is too dreadful to be accepted when it can be avoided*, and the very slight risk seems to me far preferable to the certain suffering." What a sermon on courage! But Gerty's parents, "unwilling to use mere authority," and having in vain exhausted their reasoning on her, offered her a pony if she would consent to have her tooth out! There is nothing, then, between "mere authority" and outrageous bribery! Still another case of discipline is in the story of "Jessie." Jessie has a hopeless lack of perseverance. Her father allows her to try everything, hoping that she will find something, at least among pleasurable occupations, to fix her wandering mind. The final effort is at lace-making in a beautiful garden. Jessie's interest in lace endures about three days, when it gives out, and she excuses herself to her father, concluding with:

"Haven't you often told me to keep my eyes open to see what was going on around me, and be observant, and how can I learn to make lace under such circumstances? Haven't you often told me not to try to do two things at once?" "You good-for-nothing little minx," ejaculated papa, jerking her down from his knee, "take yourself off. You'll be a burden on my hands all your life. Clear out!"

And this is actually the end of it! The excellent Miss Edgeworth would turn pale at such a notion of instruction, could she appear on our scene; and no doubt Gail Hamilton would be quite willing she should, so utterly different are her principles, and so cheerfully does she proceed to be amusing, regardless or ignorant of consequences. But those mothers who shall have admitted both authors into their nurseries will be apt to confirm the title of Miss Edgeworth's volume as "Parents' *Assistant*," while the unintentional teachings of the "natural" 'Child-world' may take long and patient labor to undo.

It seems to us that the method of dealing with children adopted by many of their modern entertainers in fictitious literature is wholly erroneous. Children do not desire, and ought not to be furnished, merely realistic pictures of themselves. Sensible parents do not describe their children to their faces, nor repeat in their presence their funny speeches or amusing little naughtinesses. Books which aim only to paint children "as they are" should be placed only in the hands of people old enough to discern their philosophy. A boy's heart craves a hero; and he believes in his hero with all the beautiful literalness and seriousness of early childhood. We mature so soon here, we so soon become self-analytical, sharp, critical, sceptical, that we not only cannot enjoy anything but realism ourselves, but we become incapable of comprehending that the young are imaginative and full of faith, and that for them a moral romance—we use the word "moral" broadly—may be made by a skilful writer of more weight and wider influence than many sermons. From the very nature of the case, it is impossible to separate children's books into the "instructive" and the "amusing," with the benevolent idea that it is cruel "to be always teaching a child," that you must sometimes show him how you "understand and sympathize" with him. A lesson he is bound to make out of everything he hears and sees, in spite of your false coddling; and if, to divert him after his arithmetic and grammar are over, you offer him a story of children with a low standard, he too will adopt a low standard. He will rest satisfied with his pertness, his slipshod good-nature, his bad breeding; he will not care a fig for such superfluities as discipline, endurance, modesty, or reverence.

The "three judges" of the last book on our list are more commonly called the regicides, Goffe, Whalley, and Dixwell. Their history is comprised in the fact that they were regicides, and became refugees. More fortunate than many of their associates who also lived beyond the Restoration, these three escaped the vengeance of the Royalists, and obtained a refuge in the wilds of New England. After their arrival here their perils were solely such as were caused by their desire to linger about the settlements of their fellow-men. In the wilderness they were safe from Royalists, and hardly endangered by savage foes. Yet as the sentiment of Puritan New England was favorable to them, these regicides lived and died in peace, known to a few friends, and only occasionally obliged to lie hid when some Government emissary was in their neighborhood. Two of them, Lt.-Gen. Edward Whalley and his son-in-law, Major-Gen. William Goffe, came to Boston at first without concealment; and the third, John Dixwell, seems to have lived undisturbed, with very little difficulty.

The book above-cited is simply a repetition of the well-known facts in the case, giving undue credence to Stiles's collection of traditions about Goffe and Whalley. It may answer, however, as a sufficient account to satisfy ingenuous youth, who will find more entertainment in later episodes in our history. We note on page 144 the curious statement that our President Harrison was descended from the regicide Gen. Harrison. On the contrary, according to Meade (i. 311), the President was son of Benjamin, the signer of the Declaration of Independence, whose earliest known ancestor was Benjamin H., born in Southwark Parish, Va., in 1645; probably the son of Herman H. or Gov. John H.

11. DAWSON'S EARTH AND MAN. The Story of the Earth and Man. By J. W. Dawson, LL.D., F.R.S., F.G.S., Principal and Vice-Chancellor of McGill University, Montreal. With twenty illustrations. 12mo, cloth, $1 50.

12. STRANGERS AND PILGRIMS. A Novel. By Miss Braddon, author of 'Aurora Floyd,' 'Eleanor's Victory,' 'Birds of Prey,' 'Lovels of Arden,' 'To the Bitter End,' etc. Illustrated. 8vo, paper, 75 cents.

13. THE LAND OF MOAB. The Result of Travels and Discoveries on the East Side of the Dead Sea and the Jordan. By H. B. Tristram, M.A., LL.D., F.R.S., Master of the Greatham Hospital, and Honorary Canon of Durham. With new map and illustrations. Crown 8vo, cloth, $2 50.

14. A SIMPLETON: A Story of the Day. By Charles Reade, author of 'Hard Cash,' 'Put Yourself in His Place,' 'Never Too Late to Mend,' etc. 8vo, paper, 50 cents; cloth, $1.

15. NAST'S ILLUSTRATED ALMANAC for 1874. With 86 Original Illustrations by Thomas Nast. Price 25 cents.

16. FLAMMARION'S ATMOSPHERE. The Atmosphere. Translated from the French of Camille Flammarion. Edited by James Glaisher, F.R.S., Superintendent of the Magnetical and Meteorological Department of the Royal Observatory at Greenwich. With 10 chromo-lithographs and 86 woodcuts. 8vo, cloth, $6.

HARPER & BROTHERS,
Franklin Square, New York.

DR. JESSUP'S NEW BOOK,

THE WOMEN OF THE ARABS, is now ready, in a handsome 12mo volume, with numerous Illustrations. Price $2. It is for sale by all booksellers, or will be sent by mail, post-paid, on receipt of price by

DODD & MEAD, Publishers,
762 Broadway, New York.

PUBLISHED THIS WEEK.

By the author of 'Credo.'

THE ARENA AND THE THRONE.

By Prof. L. T. Townsend. Uniform with 'Credo.' 12mo, $1 50.

This work comprises:

I. The Field. III. The Triumph.
II. The Defeat. IV. The King.

'The Arena and the Throne' is the most intensely interesting and the most original of Dr. Townsend's books. The great merit of the work is in the advanced conceptions of the author, which are expressed in the clearest and most forcible manner.

Completing the popular "Girlhood Series."

RHODA THORNTON'S GIRLhood. By Mrs. Mary E. Pratt. With Eleven full-page Illustrations. Cloth, $1 50.

"A successful picture of New England life."—*J. G. Whittier.*

THE TEMPERANCE DRAMA.

By George M. Baker. Containing Eight Pieces suitable for Temperance Gatherings. 16mo, cloth, 75 cents; half-bound, illustrated sides, 60 cents.

*** For sale by all booksellers. Sent post-paid on receipt of price. Illustrated Catalogue sent free by mail to any address.

THE WEEK IN TRADE AND FINANCE.

DECEMBER 1.

THE money market has been rather more active on call loans in consequence of the increased amount of business at the Stock Exchange. While parties in good standing have been able to procure all the money they required at the legal rate, others whose business requires large amounts have had to pay as high as $\frac{1}{32}$ and interest. There is more discrimination than ever among lenders as to the standing of borrowers and the character of collaterals offered before making loans.

A more active business has been doing in commercial paper, and the demand for the best names is reported to be very good. Prime names pass readily at from 10 to 15 per cent., and good names at 15 per cent. and above.

Advices from London are very favorable. On Thursday Cable despatch reported a gain of £1,065,000 in bullion in the Bank of England, and that the directors had reduced the minimum rate of discount 2 per cent., from 8 per cent., at which it had been standing, to 6 per cent.

The Union Trust Company recommenced business to-day with some $4,000,000 cash on hand with which to pay $5,000,000 deposits; besides which the Company has other assets, readily convertible into cash, to double the amount of the balance due to depositors. Several important changes have been made in the officers, to the very decided advantage of the Company. Mr. Edward King has been elected President, and we speak understandingly when we say that an appointment more satisfactory to the business community could not have been made.

The bank statement for the week ending November 30 was extremely favorable; the total liabilities were increased $6,439,000, while the reserve showed a gain of $6,900,000, of which $4,500,000 consisted of legal tenders. According to the figures published below, the banks now hold in legal tenders and specie $5,000,000 over and above the amount required by law. The following is a comparison of the averages for the past two weeks:

	Nov 22.	Nov. 29.	Differences.
Loans	$248,067,300	$247,922,300	Dec... $145,000
Specie	17,568 700	19,968,700	Inc.... 2,400,000
Circulation	27,299,800	27,238,800	Dec... 61,000
Deposits	167,957,200	174,467,200	Inc... 6,500 000
Legal tenders	30,899,700	35,399,800	Inc... 4,500,000

The stock market has been active and, up to the afternoon of Friday, strong. The greatest rise was on Wabash, Western Union Telegraph, and Northwestern common, in all of which stocks a pool was said to be operating. There was a sharp advance on Saturday in Union Pacific from 22½ to 24¾, upon the announcement that the U. S. Circuit Court at Hartford had decided in favor of the Company in the Crédit Mobilier case.

Prices were lower at the close of the week on nearly the whole list. There has been considerable realizing upon the part of holders, who, at Saturday's prices, secured a handsome profit on their purchases made within the week; besides which, a reaction should reasonably be expected after a sharp advance.

The investment stocks are firm, especially New Jersey Central, Delaware, Lackawanna & Western, and Harlem, all of which appear to be strongly held, and any demand for them advances prices without developing any large amount of stock for sale.

The following shows the highest and lowest sales of the leading stocks at the Stock Exchange for the week ending November 29, 1873:

	Monday.		Tuesday.		Wed'day.		Thursday	Friday.		Saturday		Sales.
N. Y. C. & H. R.	88⅛	89⅝	89	89⅜	89⅛	91⅝		91⅜	92⅜	91⅜	92⅜	74,000

Pacific Mail	28⅜	31⅜	30½	31⅜	29⅜	31⅜		31⅛	32⅝	32	33¼	51,100

The Government bond market has been strong, with prices generally higher, in sympathy with foreign quotations and the firmness of the gold premium. The amount of bonds seeking a market is small, especially the later issues of the five-twenties. The official statement for November shows that the National debt has been increased $9,028,576 84, and reflects the effect of the late panic so far as the revenues of the Government are concerned.

Railroad bonds have been more active with higher prices. The bonds of the Union Pacific Railroad Co. were favorably affected by the result of the suit brought by the Government against the Company and the stockholders in the Crédit Mobilier, the Incomes advancing from 58 to 67, and the Land Grants from 70 to 71.

The following Companies have defaulted upon their interest payments due to-day: Kansas Pacific, on $4,063,000 bonds; Chicago, Dubuque & Minnesota, on $4,500,000 8 per cent. bonds; and the Chicago, Clinton & Dubuque on about $1,500,000 8 per cent. bonds—the two last-mentioned being branch roads of the Chicago, Burlington & Quincy Railroad, through which corporation and upon whose recommendation the bonds were placed at 90 among its stockholders. It is probable that something more will be heard about these bonds placed by the Chicago, Burlington & Quincy.

The gold market has been sensitive to the various rumors circulated during the week respecting the Cuban difficulties. Upon the receipt of news that all difficulties were in a fair way to be settled amicably, the price declined to 108⅞, after having been as high as 110½.

SPECIAL NOTICES.

TERMS: In advance, one insertion, four cents per word; five insertions, three cents per word, each. The enclosure of a stamped and addressed envelope will secure a numbered box, to which communications may be addressed.

A YOUNG LADY desires an Engagement as Companion to a lady or governess to young children. Best of references required and given. Address Miss H., Box 31, *Nation* Office.

A POSITION in a Choir, in or near the city, is desired by Soprano, of several years' experience, who reads with facility. Address Box 10, *Nation* office.

A COMPLETE SET of the *Nation* for Sale. Vols. 1 to 8 bound in Half Turkey. The balance, vols. 9 to 17, unbound, and in good order. Address F. A. C., care of the *Nation*.

A FRESH INVOICE of Robinson & Cherrill Photographic Landscape and Figure Compositions just received; also, Gordon's unrivalled Cabinet Views in England and Wales, Normandy and Brittany, by (sole agent) C. F. McKIM, 57 Broadway, New York City.

FOR SALE. An $800 Piano for $500. Entirely new and of first-class make. Address "Piano," Box 5, *Nation* Office.

CAZENOVIA SEMINARY. Established in 1825. Has prepared over 600 young men for College. Address W. S. SMYTH, Cazenovia, N. Y.

DE VEAUX COLLEGE, Suspension Bridge, N. Y., near Niagara Falls. Church School for Boys. Cadet organizations. Registers with full details.

SPECIAL NOTICES.

MRS. WM. G. BRYAN'S Boarding-School for Young Ladies. The Fall Term of Mrs. Bryan's School commences September 17, 1873. Batavia, N. Y., June 7, 1873.

PREPARATORY SCIENTIFIC School for the Schools of Science, Technology, Mines, Architecture, etc. ALFRED COLIN, late Engineer Corps U. S. N., and Professor at Naval Academy, 1267 Broadway, near Thirty-second Street.

SCHOOL OF MINES, Columbia College. For information, address Dr. C. F. Chandler, Dean of Faculty, East Forty-ninth Street, New York.

ST. LOUIS LAW SCHOOL—Law Department of Washington University, St. Louis, Mo. For circulars or information, address George M. Stewart, Dean of Law Faculty, 203 North Third Street, St. Louis, Mo.

S. AGNES' SCHOOL.—The fourth year will begin, God willing, the third Wednesday of September next. Pupils are received whenever there is a vacancy. Application for admission should be made to Sister Edith, S. Agnes' School, Albany, New York.

FOREIGN BOOKS Reviewed in the *Nation*, and books in all languages, at SCHOENHOF & MOELLER'S, Importers, 40 Winter Street, Boston.

RUSSIA LEATHER GOODS, TRAVELLING-BAGS, DRESSING-CASES, PORTFOLIOS, WRITING-CASES, POCKET-BOOKS, FLASKS, etc., etc. CULBERT & CO., 24 Maiden Lane, N. Y.

TRAVEL.

NORTH GERMAN LLOYD STEAMSHIP COMPANY

FOR SOUTHAMPTON AND BREMEN.

The steamers of this Company will sail every Wednesday and Saturday from Bremen Pier, foot Third Street, Hoboken.

RATES OF PASSAGE TO LONDON, HAVRE, AND BREMEN,

Payable in Gold, or its Equivalent in Currency.

First Cabin, $120; Second Cabin, $72; Steerage, $30.

For freight or Passage, apply to OELRICHS & CO., Agents, 2 Bowling Green.

ONLY DIRECT LINE TO FRANCE.

The General Transatlantic Company's Mail Steamships between New York and Havre, calling at Brest. The splendid vessels on this favorite route for the Continent will sail from Pier No. 50, North River, as follows:

ST. LAURENT	Lachenes	Saturday, Nov. 29
PEREIRE	Daure	Saturday, Dec. 13
EUROPE	Lemarie	Saturday, Dec. 27

Price of Passage in Gold (including wine) to Brest or Havre: First Cabin, $125; Second Cabin, $75. Excursion tickets at reduced rates.

American travellers going to or returning from the Continent of Europe, by taking this line, avoid both transit by English railway and the discomforts of crossing the Channel, besides saving time, trouble, and expense.

GEO. MACKENZIE, Agent, 58 Broadway.

HISTORY OF ENGLISH LITERATURE. By H. A. TAINE. 2 vols., cloth, $7 50.

Sent, post-free, on receipt of price. Address PUBLISHER OF THE *NATION*.

The Nation.

NEW YORK, THURSDAY, DECEMBER 11, 1873.

The Week.

THE Republicans in the House opened the session somewhat inauspiciously by voting two of the Kellogg delegates from Louisiana into their seats without reference to a committee. About one of them, Mr. Sheldon, there was no dispute. About the other, Mr. Sypher, there was a good deal, but he was also voted in with the greatest *sang-froid*, General Butler directing the proceeding. Pinchback, of whom we have given a short biography in these columns, was the third, but his case was laid over, and the next day, under Butler's direction, was referred to a committee. An attempt was made to dispose of contested seats for Western Virginia by a party vote also, but it was too barefaced, and they were referred to a committee. But when it came to the case of Smith, the Kellogg delegate from the Shreveport district in Louisiana, which was on its face a suspicious one, the majority again went to work and voted him into his seat without enquiry by a committee, Butler again presiding over the process.

The only speeches of importance during the week were those of Mr. Morrill of Vermont and Mr. Ferry of Michigan, in the Senate, on the financial situation. Mr. Morrill confined himself to an able exposition of the defects and dangers of an irredeemable paper currency. Mr. Ferry, who represented Western ideas, advocated the substitution of Government legal-tender notes for the national-bank notes now afloat, making the total volume of irredeemable Government notes $800,000,000. This done, he would release the banks from all legal restrictions, and issue 3.65 bonds to give the currency an "elastic end," and would substitute silver for the fractional currency, after which he thinks the country would thrive in a surprising manner. He is of opinion that the great need of the day is more greenbacks. The "elastic end" to his currency would, however, only enable him to put money into bonds when it was too plentiful; it would not enable him to increase the volume of the currency when it was too scarce—a difficulty which has been frequently pointed out to the advocates of schemes of this class, and to which we again earnestly call their attention. Will they seriously consider what is to be done when, the business of the country having "grown up" to their $800,000,000 limit, the stringency again begins to be felt? Suppose the whole amount is thrown out, and money still brings 200 per cent. in Wall Street, what then? Would they not once more step forward and ask for more greenbacks, and so on *ad infinitum*, or, in plain English, to the bottomless pit? Mr. Kelley of Pennsylvania also appeared on the scene in the House with the 3.65 bond scheme. The amount of happiness and prosperity expected from this plan appears to be enormous. It seems to bring many gentlemen mental peace not unlike that which Micawber felt when he discharged his debts by giving his note. The ignorance—we were going to say brutish ignorance—which prevails on these questions in many quarters has been illustrated during the week by the Chicago *Journal of Commerce*, which maintains that the volume of the currency does not affect prices, and the Philadelphia *Press*, edited by a leading Pennsylvania politician, actually adopts the statement.

Mr. Wilson of Indiana has also introduced a financial scheme, which proposes to remove all restrictions on the bank circulation, and allow the banks to use their reserves, and enable the Government to withdraw enough legal tenders, as fast as the bank circulation is increased, to accumulate a Government "reserve" of $100,000,000, to be lent in tight times to all comers, on the security of Government bonds, for periods not exceeding three months. This is the old story; but he makes one new and excellent proposal, which is that the Bank Examiners should report to the Comptroller of the Currency at stated intervals, and publish in the local papers, the nature and amount of the loans made by the banks, and the kind of security taken. This would supply valuable information now wanting to dealers, and would inspire bank managers with much salutary caution. We present these schemes now as fair specimens of what is floating in the minds of inflationists and persons who think that some good must come of putting the pea under another thimble; but we owe it to our readers not to burden our columns with any more of them until something is produced with a sufficient amount of support to make it seem likely that it will pass.

In our account of the President's Message, we were unable for the want of space to give any account of the Dominican Protectorate applied for by Baez. It seems that as long ago as the 18th of August, Baez drew up a memorial to the President, recalling to his memory the facts in the case, viz.: that though for thirty years the Dominicans have been harassed either openly or by secret warfare by the Haytians, and that though always successful on the field of battle, they have "not yet been able to complete a victory." For this reason they desired annexation, but the annexation scheme falling through, the country was left to struggle alone with overwhelming difficulties, the Samana Bay Company giving "the finishing stroke to the situation," "especially since the noise of its establishment has been succeeded by the most deliberate silence and the most listless indifference." Baez therefore asks relief for the Dominicans from their present situation, which he says is "horrible," by the establishment of a protectorate, and expresses the opinion that if the President does establish one, he will have "the immense satisfaction of having saved the future of a people of the world discovered by Columbus," without entailing upon himself any embarrassment whatever. This document, it is now said, was handed by Baez to a representative of our Government, who took it home with him, and forgot all about it until he remembered that Congress was going to meet in December, and then sent it on to Washington. Dr. S. G. Howe, who wrote to us some weeks ago denying that the Samana Company was urging the Government to establish a protectorate, will find in this petition of Baez the facts out of which the rumor sprang. Dr. Howe in his letter said that a statement of ours, to the effect that the "barbarous population of the interior are now in arms against him" (Baez), was entirely untrue. Baez, unfortunately, represents that, whether they are in arms or not, they give him at any rate a great deal of trouble; and we are inclined to think that his views about his actual condition in San Domingo are as trustworthy as those of Dr. Howe.

After the Crédit Mobilier exposure last winter, Congress passed an act directing a suit against everybody connected in any way with that company. The object of the suits was the recovery of the money of which the company had defrauded the United States, and, for the convenience of the Government, the act authorized a single suit against all the defendants in a single United States Circuit Court in Connecticut. The immediate effect of this act was a depression of Union Pacific securities, owing to the injunction served on every one who held the bonds, the innocent holders suffering quite as much as the "corruptionists." The suit itself has gone against the Government, the court (Judges Shipman and Hunt) deciding that it had jurisdiction, but that the Government had not sufficient interest to support the suits. The case will be taken up to the Supreme Court. The whole affair has been shamefully mismanaged, for the Government has certainly been defrauded of several millions dollars interest, if nothing else, and at one time had such a control over the road that it might have compelled any terms; but that was before the Crédit Mobilier business was heard of. As to the suit itself, the defendants were represented by such lawyers as B. R. Curtis, Sidney

Bartlett, and W. M. Evarts, while the Government lawyer was Mr. George H. Williams. The appearance made by Mr. Williams in the case was very unfortunate, and does not tend to reconcile the bar throughout the country to his nomination as Chief-Justice.

The publication of the protocol of the agreement between Mr. Fish and Admiral Polo caused great excitement at Havana, which Jovellar, the Captain-General, tried to calm by a proclamation, meanwhile, however, telegraphing to Madrid that the order of the Government in the matter of the delivery of the *Virginius* would be carried out. On Friday last the news came that Cuba, or rather the Volunteers, were prepared to fight Spain, the United States, and any other great powers that made common cause with them, sooner than surrender the *Virginius*, and this alarming threat was actually sufficient to cause a decline in stocks and an advance in gold. The Volunteers were, it is said, prepared to deliver the ship to a neutral power instead of the United States, to await the result of arbitration, and Admiral Polo, it was reported from Washington, gave some support to the suggestion, but Mr. Fish declined to accede to it. Later advices show, however, that the Volunteers are undergoing a change of mind, and will probably not engage in hostilities with the United States at present. Our Government has in the meantime very properly avoided wounding their susceptibilities by not making as yet any display of force in Cuban ports.

There have been numerous stories during the week about General Sickles's position in Madrid, and it seemed at one time to be certain that he had resigned. At this writing, however, the news is that nothing is known of his resignation in Washington, and that the sole reason why he has been set aside in the late negotiations is that the Spaniards preferred treating through Admiral Polo. This does not militate against the story, however, that he has been making himself, in some manner, obnoxious at Madrid. In fact, we believe that he has never been more than tolerated there, in spite of the efforts of some of the Administration papers to make it appear that he was becoming an object of mingled love and reverence. Whether he has resigned now or not, we think most decent people on this side of the water are of opinion that it is high time that he did. He has never been anything in Spain but a disgrace to us all. He was preceded to Spain by a pamphlet in Spanish, which was sent to every Spaniard of note in and out of politics, and contained his not very savory private history in full. The result was, of course, that his appointment was felt to be an insult, which, however, Spain was in no condition to resent. So Spanish gentlemen made the best of the matter by covering him with official civilities and carefully withholding social ones. Spaniards are not remarkably good politicians, but men of honor are still numerous among them.

A despatch was received from England on Monday which bore evident marks of the cock and the bull, relating how the crew of the *Loch Earn* had reached home, reported that the French officers and crew of the *Ville du Havre* had behaved in a most cowardly manner, the officers having made their escape in dry clothes in their boats before the steamer sunk, and resisted the entreaties of the *Loch Earn's* people to go back and try to save life, until the latter, in a burst of humane indignation, took arms and threatened to fire on them. This was all silly and ridiculous; but it obtained circulation and credence enough to induce the agents here to telegraph to France and ask for an answer, which has come. It contradicts the story *in toto*, and with it contradicts the statement of the master of the *Loch Earn* that he saw the steamer long before he struck, and vainly endeavored to attract her attention and avoid the collision. The matter has undergone thorough enquiry in France, and we shall probably have the evidence, if not the report or decision, in a few days. In the meanwhile, the fewer "theories" are put in circulation, the less injustice there will be done. We may say, to come down to particulars, that the "views of an old shipmaster," of which there are a great many afloat just now, on a marine disaster of the facts of which he knows nothing, are hardly more valuable than those of an old gaucho.

Besides the Boston municipal election—so curious for its multiplicity of candidates, and so encouraging in its defeat of the rings—two other things in Massachusetts politics are worth attention. One is the movement, already well under way, of fully rehabilitating Mr. Sumner as the regular Republican candidate for the Senatorship. Who it is that is to be his opponent next winter, in case nothing goes awry in the meantime, is well understood; but General Butler apparently has forgotten how hard a man to beat Mr. Sumner can make himself in any probable Massachusetts legislature. It is a long way to be looking ahead at this time, it being possible for so much to happen between now and January of 1875, but the preliminaries of the contest are already engaging serious attention in that State. The other thing of which we have spoken as noteworthy is the probability that in the course of the next two years an end will be put to the long and discreditable chapter of Massachusetts prohibitory legislation, so-called. A rearrangement of legislative representation takes place after the census of the State has been taken. Massachusetts takes a census independently of our national census, in the middle of each decade. It is known already that the census of 1875 will furnish further proof of the fact that the State tends more and more to gather its population into the cities and towns. These busy places grow with rapidity, and relatively to them the country districts may be said to stand still. But the cities and towns show every disposition to abolish at least the more obnoxious portions of the prohibitory legislation, and even to do away with it altogether. Should this anticipated event take place, it will, to be sure, be a rather illogical way of bringing to an end the State's policy in respect to this matter, but we imagine that it will be welcome nevertheless. And, indeed, to make men act as cool legislators in regard to a subject about which it is so much easier to feel and wish like a good man than to decree like a wise one, will always be hard. It is a very searching test to apply to the ability of any legislature, and it is no wonder if our legislatures are found wanting when tried by such a standard. It is a little wonderful, however, that they should swear till they are black in the face that they are not found wanting.

The Granges continue forming throughout the West, and the membership in the entire country is estimated at several hundred thousands. Since the elections, and probably not only since but because of the panic, there has been latterly in these organizations very little of the discussion which seemed so rife a few months since on the subject of *pro-rata* transportation charges. When a Grange meets now, and organizes by the choice of officers—among whom in some of the Granges is a female official known as Ceres and another as Pomona—the debates which ensue are as a general thing not denunciatory of the corrupt holders of stock, but cover much ground, political, social, and financial—ranging often from the tyrannous exactions of the Pork-men to some of the nicest questions of finance, political economy, and sociology. The Indiana State Grange, for instance, has been in session at Valparaiso, and adopted resolutions favoring such a change in the laws "as will remove the trial of all minor crimes punishable by fine or imprisonment in jail to justice's courts"; favoring "such expansion of the currency" as may be "necessary to relieve the country of the present financial embarrassment and promote the interests of labor"; favoring a reduction of the number of members of the legislature by redistricting the State; condemning all increase of salaries; demanding the repeal of the Salary-grab Bill, and favoring the encouragement of home manufactures. The only thing in the platform relating to railroads was a resolution in favor of more lines, and asking for Congressional charters, but opposing Congressional subsidies.

Judge C. T. Sherman of Ohio (United States District Court for the Northern District) has resigned his position on account of the charges brought against him some time ago. The charges, which were substantially proved, were these: Hearing that the New York Stock Exchange wished to obtain a repeal of the tax on borrowed capital, he made an arrangement with Mr. Lockwood, one of its principal members, since dead, to bring about the repeal; and, the repeal having been secured, demanded $10,000 for his services, representing that the repeal was accomplished chiefly by himself, through his great influence with such men as his brother, John Sherman, Chairman of the Finance Committee of the Senate. When brought before the Committee of Ways and Means, however, he denied that he had had any interviews with the gentlemen named, and said that he did not want the money for himself, but for some third persons—Judge Bartley, his brother-in-law, and Mr. R. C. Parsons, a United States marshal. He says in his letter of resignation that his leading and governing motive in leaving the bench is the desire to "avoid publicity." Judge Delahay of Kansas, another United States judge, has made up his mind to retire from the bench, and has resigned; but what he desired to avoid was not publicity, but impeachment for drunkenness.

The quarrel between the people of Pennsylvania and the Philadelphia Ring has resulted in a victory for the latter. The Supreme Court has unanimously decided the ordinance of the Constitutional Convention, providing a special election for Philadelphia, under the superintendence of a commission appointed by the convention itself, to be illegal. The election, as far as Philadelphia is concerned, must therefore be held under the registry law passed by the Ring for the sole purpose of enabling it to roll up fraudulent majorities. The ground of the decision is that the legislature imposed restrictions on the convention, one of which was a restriction from interfering with the registry law. Those restrictions the convention illegally disregarded. There is, besides this, however, another miscarriage, for the registry was not the only thing which the legislature, on passing its law for the government of the convention, declared to be sacred. They forbade, also, any interference with the Declaration of Rights, and notwithstanding this injunction the convention made alterations in it. The opponents of the instrument now say that these alterations have "tainted the whole work," and hint very broadly that if they do not defeat the constitution at the polls they will afterwards get the Supreme Court to declare it null and void, or that they will perhaps get it declared void in advance. There is known to be an overwhelming majority in the State in favor of the constitution, and it would be melancholy indeed if technical quibbles should really defeat what is perhaps the best draft of a constitution in the United States. It may be worth while to recall the fact that the constitution of the United States itself was adopted in a wholly illegal manner, the Constitutional Convention which assembled at Philadelphia having been sent there under restrictions imposed by the States which it disregarded in the most glaring way; it would seem that their work was all tainted, and that we have really had no constitution in this country for nearly a century—and in fact never. The *Press* of Philadelphia says that the newspapers of the State stand (without counting those which are not committed either way) 208 for, to 18 against, the constitution.

Bishop Cummins's secession has resulted in the formation of a new church, called the "Reformed Episcopal Church." The organization was set up in this city a fortnight ago. Dr. Cummins is the presiding bishop, and Mr. Cheney, of Chicago, the missionary bishop. The new church stands by the Bible, the Apostles' Creed, the Thirty-nine Articles, and recognizes the episcopacy, not as of divine right, but as "a very ancient and desirable point of church policy." It condemns as erroneous the doctrine that there is only one order or form of ecclesiastical polity in Christ's church; that ministers are any more priests than other believers; that there is any real presence in the Sacrament of the Lord's Supper, or any regeneration in baptism. These are all Low-Church doctrines. It is difficult to see, however, what Dr. Cummins and Mr. Cheney hope to gain by keeping up the episcopacy. They both proclaim that nobody is bound to obey a bishop unless he pleases, and the use of a bishop who has no authority has not yet been revealed. Why will Mr. Cheney, on his own showing, be anything more than an itinerant preacher? His confirmation can be dispensed with, and his ordination is a mere form.

The British expedient for the solution of the railroad problem, the "Railway Commission"—appointed by an act of last session of Parliament for the decision of controversies between the corporations and the public—has recently had its first sitting, and a report of the proceedings has reached this country by the last mail. The experiment is one which we on this side of the water would do well to watch. The commission is composed of a dry statistical politician, Sir Frederick Peel, a man entirely wanting in "magnetism," a Queen's counsel, Mr. MacNamara, and an engineer, we believe, Mr. Price. The jurisdiction of the commission covers all complaints of the charges made by the companies, and all other disputes between them and the public, except such as relate to damages for injuries actually sustained; these are, as heretofore, left to the courts. The cases which came before the commissioners on the first day may help to give some idea of their powers and duties. They were only two in number. One was the complaint of the town council of Dover against a railroad company for not supplying Dover with adequate railroad accommodation, both as regards fares and the number of trains, and for giving undue preference, to the detriment of Dover, to Ramsgate, Margate, and Hastings, which are rival watering-places. The other was that of an expressman, or carrier, against another company for giving themselves, indirectly through their agents, a preference over him in the collection and delivery of goods. In every case the complainants are examined strictly on the point whether they have used all proper means to obtain redress directly from the railroad before coming to the Commission, as it is only when these have been exhausted that a summons is granted.

The Austrian Minister of Finance has introduced some extraordinary measures for extricating the commercial community in Vienna from the financial embarrassment in which it has been languishing since April last. The attempt made to wind up the various broken-down companies by the aid of a syndicate of bankers, of which we spoke some weeks ago, has failed through want of money and the panic in New York, so it is now resolved to resort to extraordinary measures and make a great state loan to people in distress. Neither "Uncle Boutwell" nor "Daddy Richardson," as the brokers call them, has ever proposed anything half so paternal. The state is to borrow $40,000,000 in silver, and lend part of it to complete the railroads which were in process of construction when the panic occurred. What remains of the money is to be lent out, through the medium of loan-offices, on produce and wines not subject to deterioration, and on quotable stocks and bonds, for periods of three and six months, and at eight per cent., which is what the money costs the Government. Whether this will "move the crops" remains to be seen. There is, we believe, a scheme somewhat resembling this in preparation at Washington, by which an unlimited quantity of "money" is to be lent to all persons applying for it, on bond and mortgage on real estate, at four per cent. per annum; but here the Government is not to descend to borrow the sum needed to make the loans; it is to strike it off from an Adams press, in the best style of typography.

THE CUBAN VOLUNTEERS.

NOTHING has occurred in the Cuban affair to raise any doubts as to the soundness of the opinion that the *Virginius* was not entitled to the use of the American flag, and that the dispute with Spain will eventually turn upon her mode of deciding the character of the ship and of disposing of the passengers. The theory to which Dr. Woolsey has given some countenance, that, if the *Virginius* was a mere pirate, we might not be able to call Spain to account for her summary mode of dealing with the crew, receives a severe blow from the following article of the Treaty of 1795 between that country and the United States:

"ART. VII.—And it is agreed that the subjects or citizens of each of the contracting parties, their vessels or effects, shall not be liable to any embargo or detention on the part of the other for any military expedition or other public or private purpose whatever. And in all cases of seizure, detention, or arrest for debts contracted or offences committed by any citizen or subject of the one party within the jurisdiction of the other, the same shall be made and prosecuted by order and authority of law only, and according to the order of proceedings usual in such cases. The citizens and subjects of both parties shall be allowed to employ such advocates, solicitors, notaries, agents, and factors as they may judge proper in all their affairs and in all their trials of law in which they may be concerned before the tribunals of the other party; and such agents shall have free access to be present at the proceedings in such causes, and at the taking of all examinations and evidence which may be exhibited in the said trials."

If this article have any force, while the right of the *Tornado* to arrest the ship may not be questioned, the duty of holding the crew for examination, according to the stipulated forms, seems very clear, and the offence against humanity involved in their execution has been aggravated by breach of faith. We may add that, while we hope our Government will not complicate the pending case by the introduction of any new points, a settlement with Spain cannot be called complete which does not provide in some manner for the control of the Cuban Volunteers. The presence so close to these shores of a large body of armed men, undisciplined, and refusing obedience to any authority known to diplomacy, is something which, out of consideration of the difficulties created by the rebellion, it may have been well to overlook for a while, but five years is long enough, and, as it has turned out, too long, for any such indulgence. The holding of Cuba by an army which deliberates in public meetings, regulates its movements by resolution, and refuses obedience to any regularly constituted government, and threatens foreign powers with war, is something which no neighboring power can be expected to tolerate indefinitely. We are, as our readers know, opposed to anything like "blood and thunder" diplomacy, and think a war with Spain would be one of the most wretched enterprises in which a nation like this could engage. We can, therefore, say, without being misunderstood, that we should be very sorry to see plainly necessary precautions neglected, and plain duties avoided, either through sentimental admiration of Señor Castelar, or sentimental sympathy with that peculiar form of political organization called the "Spanish Republic." These two motives supply a good many people with all the policy they have with regard to either Spain or Cuba, and we dare say that in all the ladies' boarding-schools and at all the Women's Rights lunches they are deemed overwhelming. But it can hardly be that they will weigh seriously with adult male politicians like General Grant and Mr. Fish. Whatever may be Señor Castelar's merits, and whatever may be the character of the Government over which he presides, and however reluctant we may be to mix ourselves up in the Cuban embroglio, and however ready we may be to look on while the Spanish regulars try to extinguish the rebellion, the *Virginius* affair shows plainly that we cannot safely tolerate any longer the control of the island or of the civil authority by the Volunteers. These Volunteers are a large body of armed men who are not amenable to the Captain-General or to the home Government, and who nevertheless proclaim martial law and inflict death by sentence of drumhead court-martial at their pleasure, and who pass on the lives of foreigners apparently with as little hesitation as on those of native Cubans. Their movements, so far as can be made out, are directed by a club in Havana, having branches in other cities, called the Casino Español, which deliberates in secret and openly defies the recognized functionaries of the state. In fact, these men have come to occupy towards their own Government a position closely analogous to that occupied by the Janissaries and Mamelukes, before their destruction, towards the Governments of Turkey and Egypt respectively. Towards foreign governments, and our own in particular, they occupy to all intents and purposes the position of a band of buccaneers who have taken possession of a West Indian island and bid us defiance. They are not worth discussing as a military body. They are apparently drilled to some extent, but show no sign of discipline, and would probably be dispersed on open ground by a few rounds of grape; but as long as they are let alone, under the pretence, which everybody knows to be a sham, that they are Spanish troops under the orders of the Spanish commander-in-chief, we shall be constantly exposed to complications such as that from which we have just so narrowly escaped.

Now, we think we are within the mark when we say that our Government owes it to American citizens of all classes, to merchants, to sailors and travellers especially, to see that this nuisance is now abated. It is perfectly reasonable to ask the Spanish Cabinet either to disarm the Volunteers, or to convert them into a proper military corps, under military discipline and professional officers. If it cannot do this, or refuses to do it, then it will certainly be our duty, and one which international law allows and common sense imposes, to exercise a police in Cuban waters and ports so powerful that we shall have an end, at least in the large towns, of the butcheries, and émeutes, and vaporings which have disgraced Cuban history during the last five years, and that American citizens shall have a fair trial. We cannot negotiate with the Casino Español, but we can bring it down to its proper duties of smoking and gossip. Of course this means that the navy ought to be put on proper footing. We ought to have a small iron-clad fleet of the best kind, and maintained in the highest state of efficiency. The worst of being taken as short as we are now is not the laughableness of our hurried launching of swarms of old wooden tubs, but the enormous waste, jobbery, and corruption which this sudden preparation either produces or covers, and which in the event of hostilities exposes us to a check which, by stinging us to the quick and leading the enemy to underestimate our strength, might convert, as once before, a "ninety-day" skirmish into a long and bloody war.

THE CONGRESSIONAL SITUATION.

IT is now but little more than two years since this city appeared to be hopelessly under the rule of the Ring, with Tweed jocular in the supposed impregnability of his position; with a judiciary whose controlling members turned the judicial power to the support of what was dangerously bad, and the protection of those who were most audaciously guilty; with operators like Fisk, able to use the civic power, the courts, and the ruffian element of the city with equal impunity in furtherance of their predatory schemes. The changes that have taken place since, and the consummation that has been reached so recently, it is unnecessary to sketch. Outside of the city, there was the same general apathy of the public conscience, indifference in the breasts of some men, and hopelessness in the breasts of others. The immense harvest of embezzlements and defalcations which we have reaped during the current year were not only planted but well grown, the principal difference between that time and this being that the public intelligence did not care to investigate where it suspected, nor to bring criminals to punishment where crime had actually been brought to the light. Underneath that apathy, however, there was, as we frequently took occasion to hope when affairs seemed at the darkest, a sense of right and an appreciation of public integrity that would become effective whenever aroused into real action. In this city the evils were the worst, but they were not confined to the city; and it is, therefore, not surprising that other and distant parts of the country have, within say four years, been engaged in the work of reform. The Constitutional Convention of Illinois is an instance of what public sentiment was

there, and the recent Constitutional Convention in Pennsylvania is an instance of what public sentiment is becoming there. Both of these conventions, we may remark, went much deeper into matters than their projectors even hoped for, and both will leave lasting effects and results that could hardly be anticipated by the most sagacious. It seems now clear that the Constitutional Convention of New York came too soon, and that its extraordinary timidity was the effect of the then supposed public indifference, and its timidity the cause of the limited good and unsatisfactory result which it accomplished.

So far as the Federal Government was concerned, the principal evils under which the country suffered were readily traceable to Congress. In Congress at that time the Crédit Mobilier operators must have felt as secure in their position as Tweed did in his, with the apparent advantage that their public enquiry was effectually over, while his was only beginning. The "salary-grab" of 1866 had produced very little censure, notwithstanding that it was retroactive, that it was fraudulently coupled with a meritorious measure, and that it was pushed through Congress with indecent haste. Congressmen took courage, and, after ingeniously dividing the responsibility between the two political parties, so that neither could be made to answer for it, concluded that the act would be forgotten, or, at most, be classed with ordinary public and political scandals. Indeed, the public apathy was so universal that the honorable managers of the foray were afterwards able to boast that only one member had refused to take his share, and that he was not re-elected by his constituents. Special legislation was rapidly becoming the only legislative business, and Honest John Vanes, by the dozen, regarded "the last hours of the session" as an unfailing harvest-time, and congratulated themselves when the hammer fell, and the Speaker declared the session at an end, as "being now in comfortable circumstances." Such claimants as Mr. Chorpenning were coming forward with greater vigor than had been displayed by them since the days of Galpin and Matteson, and, in short, affairs looked very much as though it were generally conceded that Congress could do what it pleased with the country. In our columns, before the last Congressional election, we urged the advisability of sending new men to Congress, and, while giving due credit to the incomparable advantage of real trained statesmanship, we pointed out that modern Congressional experience had bred nothing more than adroitness in a system of tactics sufficient to hinder every measure of reform, but never sufficient to stop a flagitious piece of legislation. The action of the Congressional constituencies did not seem as decided then as was wished, but it is now evident that much more was felt than appeared on the surface. The unusual change which was made in the House of Representatives, though not unequivocal at the time, now looks like an advancing wave of the changed tide of public opinion.

Such being the situation outside of the national capitol, we may next note the changes which have occurred within. In the Senate they are comparatively few. The Republicans have lost such men as Pomeroy and Patterson; the Liberals, Mr. Trumbull; the Democrats, Mr. Casserly; but with the exception of the two last-named, the effective leaders of the Senate remain the same. In the House the remarkable fact is to be noted that two-thirds of that body are new members. These new members are not the direct fruits of the salary-grab and Crédit-Mobilier awakening. Their elections took place before those two scandals wrought out the present state of public determination. They were not chosen as reformers. They were not instructed by their constituencies through the elections as to what incisive work would be expected from them. They merely came into Congress with a lively sense of what they have recently heard, and tolerably clear ideas of some things in the way of public wrong which the people are by no means disposed longer to endure. Being for the most part politicians of the modern school rather than reformers of the school which is yet to be brought into Congress, it is natural for them to look, or try to look, upon the changing tone of public sentiment as an ebullition of passing excitement, and shape their measures for the temporary rather than the permanent redress of national grievances. In other words, they believe it cheaper for the modern Congressman to undo with ostentation some of the "most obnoxious" doings of the last Congress than to busy himself quietly with a system of reform which shall assure us against such doings in the future. That "the last hours of the session" are not necessarily and properly a harvest-time for the individual legislator will strike many of the new members as quite as chimerical as the other annoying proposition, that the public service is not necessarily and properly a fund wherewith the Executive ought to bribe the Congressman, and the Congressman buy up his constituents.

Such being the state of public feeling on the one hand, and the condition of Congress on the other, it is not wonderful that Mr. Blaine should be rechosen Speaker. We have before this classed Mr. Blaine as among our better politicians, and have founded some hopes on his energy, courage, and intelligence. He was, at the opening of Congress, in a position to choose between public opinion outside of the House and the political wiles and influences within. Something was expected both inside and outside of Congress. It was inevitable that a choice must be made between the better and worse elements of Congress, and the attempt to remit the choice to a caucus having failed, it was equally inevitable that Mr. Blaine must accept the responsibility of choosing both for himself and for his party. It is needless to say how he has chosen. General Butler promoted to the chairmanship of almost the most important committee of the House; Mr. Butler of Tennessee assigned to the chairmanship of another committee; Mr. Dawes, with his Crédit-Mobilier duplicity hanging about him and his back-pay still in his pockets, rewarded with the highest post of honor in the Speaker's gift; Mr. Cessna (Chorpenning's Honest John Vane) placed on the Judiciary Committee to draught laws against Congressional corruption; Mr. Schofield given the chairmanship of the Committee on Naval Affairs, when naval affairs promise to involve the most numerous contracts and largest outlay of the session; and, not finally, but perhaps most significantly, Mr. G. F. Hoar, who did not, like Mr. Dawes, gratuitously pledge himself to support General Butler, pushed into second places on insignificant committees, while Judge Hoar, with all his courage, ability, and experience as Attorney-General, is shelved on committees where he can do the least good to the country and the least harm to the politicians.

Such is the Republican situation in Congress—the position which the party has assumed with regard to the past—the assurances which it gives with regard to the future. As to the Democrats, a recklessness which indeed seems like insane depravity brought them directly to the point of choosing as their leader at this eventful time the predecessor and preceptor of Tweed—an equally bad though not an equally bold or able man. It is, however, refreshing to know, and one of the hopeful signs of the times, that Tammany has felt the necessity of uttering a protest against the act, and (stranger still) an approval of the two bolting members. We await with some curiosity the censures which Republican conventions will utter against the disheartening organization of the House.

SUGGESTIONS AS TO THE BANKRUPT ACT.

IF the framers of the Constitution, in giving Congress the power to establish a uniform law on the subject of bankruptcy, could have foreseen what use would have been made of the power, they would perhaps have been inclined to make the clause compulsory rather than permissive. At any rate, if they had been gifted with prophetic foresight, they could not have failed to be amused at what was coming. That for some years the power should have lain in abeyance was not perhaps so remarkable, because for some years the business of the country was yet small; there were no railroads or telegraphs; in fact nothing like the network of commercial correspondence and intercommunication which, since the opening of the railroad era, has made connection between the various parts of the country so close and the country itself so homogeneous. Nor was there anything very surprising in the fact that the first important

bankrupt act should have been the result of the panic of 1837—by far the worst commercial crisis through which the country has ever passed. But what does strike us as remarkable is that a bankrupt act having been passed in 1800, only to be repealed in 1803, and another having been passed in 1841, for the purpose of enabling those who had become crippled by the financial embarrassments of 1837 to get rid of their debts, it should have happened that this desirable object was no sooner accomplished than this act also was immediately repealed; and that having been again revived because at the close of the war another generation of debtors found themselves hopelessly involved, it should again be proposed, now that the second bankrupt generation have generally got their discharges, to repeal the law and begin once more. It was the idea of the framers of the Constitution that the growth of population and commerce, might, as they have done, make the local State insolvent laws prove inadequate and embarrassing, and that the time might come when a uniform law on the subject would be as important to us as a uniform currency, or as a uniform bankrupt law is in England; but that the machinery they provided would be made use of at intervals of twenty or thirty years, first, by enactment for the purpose of enabling debtors to get rid of their debts, and secondly, by repeal for the purpose of facilitating the production of a new crop, to be harvested by a new bankrupt act—this is what they probably hardly looked forward to at all.

Whether or no the present bankrupt act is in need of amendment is a question into which we do not propose to enter, but there are one or two considerations connected with the subject which are important, and which are yet generally overlooked. The President has recently been looking into the matter, and the conclusions at which he arrives in his message are, first, that "at this time many considerations might be urged for its total repeal"; but, in the second place, if this is not considered desirable, he thinks that

> "It will not be seriously questioned that those portions of said act providing for what is called involuntary bankruptcy operate to increase the financial embarrassments of the country. Careful and prudent men very often become involved in debt in the transaction of their business, and though they may possess ample property, if it could be made available for that purpose, to meet all their liabilities, yet on account of the extraordinary scarcity of money, they may be unable to meet all their pecuniary obligations as they become due, in consequence of which they are liable to be prostrated in their business by proceedings in bankruptcy at the instance of unrelenting creditors. People are now so easily alarmed as to monetary matters, that the mere filing of a petition in bankruptcy by an unfriendly creditor will necessarily embarrass and oftentimes accomplish the financial ruin of a responsible business man. Those who otherwise might make lawful and just arrangement to relieve themselves from difficulties produced by the present stringency in money, are prevented by their constant exposure to attack and disappointment by proceedings against them in bankruptcy; and, besides, the law is made use of in many cases by obdurate creditors to frighten or force debtors into a compliance with their wishes, and into acts of injustice to other creditors and to themselves. I recommend that so much of said act as provides for involuntary bankruptcy on account of the suspension of payment be repealed."

Now, it will be seen that the feeling underlying these recommendations is that it is a very disagreeable thing to be obliged by creditors to pay our debts. The President says, indeed, that the bankrupt act has increased the financial embarrassments of the country, and that this "will not be seriously questioned," but the only argument by which he supports this proposition consists in saying that prudent and careful men often involve themselves in debts which the scarcity of money renders it difficult for them to pay. This is no new discovery. The year 1873 is not the first year in the history of the world in which money has been scarce. It has been scarce every autumn in this country since the issue of greenbacks began, and if the arguments which the President advances are sound, they have been sound for the last ten years, and were sound even so late as June 30, 1870, when he approved the amendment to the original law, providing that any one "who has stopped or suspended and not resumed payment of his commercial paper within a period of fourteen days," may be proceeded against as a bankrupt. It is certainly true, as the President says, that when people are in a timid and nervous condition, they frequently injure a trader's business-standing by filing a petition against him, and that if no creditors ever took any proceedings whatever against their debtors, there would be no bankrupts in the country. It is also true that any law for the enforcement of debts may be made use of by "obdurate creditors" to "frighten or force debtors into acts of injustice to other creditors and to themselves," but what has all this to do with the question?

What the President says—and it is a very good résumé of the current arguments on the subject—is in reality directed against any kind of an insolvent law which authorizes proceedings against debtors in cases where they have not committed acts of fraud. The only difference between a bankrupt law and an insolvent law—other things being equal—is that one is "uniform" and gives a discharge of debts through the whole country, while the other is local and applies to a single State. The President probably had no intention of going to the length of maintaining that careful and prudent men who become involved ought to be able on proof of "due diligence" to be relieved from the obligations imposed by law on the rest of the community. There are a great many other statutes besides the bankrupt law which in times like these are a serious embarrassment to "careful and prudent men," as for instance the laws relating to attachment, execution, and sale under foreclosure.

It is very much to be hoped that there will be some intelligent discussion of the matter somewhere, and that, before the act is repealed out of hand, some light will be thrown on its actual operation. For example, we should like to know whether it has not had a very good effect on railroads, in creating an increased sense of responsibility where it is so much needed, and in facilitating the enforcement of debts against them created by mortgages. When five or six years ago there was some doubt whether a railroad could, under the provisions of the act, be adjudged a bankrupt, the companies in every test-case made the most strenuous efforts to resist it, though without success, and they were wise in their generation. The large debts which all railroads owe are mostly secured by bond and mortgage; but this security to the ordinary bondholder is not by any means what it seems to be on paper. The mortgage is usually made out to three trustees, who are supposed to represent the bondholders' interests, and to take steps for foreclosure if the interest is not paid; but these trustees are not the servants of the bondholders, not their representatives, not even selected by them. They are mere agents of the road, closely connected with its management, and in case of trouble their interests are opposed to those of the bondholders for whom they act as trustees. Let any one who holds a railroad bond look at the names of the three gentlemen to whom it runs, and ask himself whether they will be very likely, in case of a default of interest, to take steps to foreclose the mortgage, when foreclosure will destroy the stocks, put an end to the nice contracts, and, in a word, overturn the régime by which they live. But let a petition in bankruptcy be filed, and there is a wonderful difference in the appearance of the scene. If the road is really insolvent, its affairs are wound up under the superintendence of a committee of the creditors, appointed not by the railroad but by a court; while, if the road is solvent, heaven and earth will be moved to make some arrangement by which its debts can be paid and bankruptcy averted; for bankruptcy, as the President says, is unpleasant. Here we have a distinct advantage secured to a large class of the community by the act, and one which could not, it seems to us, be secured in any other way. At any rate, these facts about railroads make it evident that the matter ought to be discussed in a spirit quite different from that which dictated the paragraph in the President's message which we have quoted, and we trust that before the matter is disposed of this will be done.

THE ORGANIZATION OF CONGRESS.

WASHINGTON, Dec. 6, 1873.

THE two Houses of Congress are once more in working order. For some time it looked as if the Cuban difficulty would become the all-absorbing subject of discussion until Christmas, but at the present moment the prevailing sentiment seems to be, the less said about that, the better. Con-

gress is, a few Senators and Representatives excepted, not at all in a warlike mood, and the same may be said, I think, of several members of the Administration. The Secretaries of War and of the Navy, indeed, seized this occasion to blow themselves up into new importance, to indulge in bellicose bluster, and to spend large sums of money in preparation for emergencies. A war would undoubtedly have been welcome to them, as an inflation of the currency would be to business men in doubtful circumstances. But the Secretary of State wanted peace, and, if I am correctly informed, he would have conducted the negotiations with Spain in a much more moderate and cautious spirit, had not, at the beginning, the impression prevailed here that the "excitement and indignation" in the country were genuine, and that the Administration would not be able to sustain itself in Congress and before public opinion without a war-whoop. It was probably this fear, which was not allayed until a large number of Senators and Representatives had arrived here, which prevented a calm consideration of the question, and led the Secretary into a position with regard to the status of the *Virginius* as an American ship, and the right of Spain to arrest and take her, which he otherwise might not have chosen, and would have been sorry to maintain by force of arms. As matters now stand, it is not unlikely that a discussion of the subject in Congress will be avoided unless the volunteers in Cuba should refuse to deliver the *Virginius*, and thus open the whole question once more. What turn things would take in that case it is impossible to predict. I know that the position taken by the *Nation* in this matter is shared by a very respectable number of influential men in both Houses; but many of them might feel compelled to stand by the Administration in insisting upon the execution of the agreement once made between the Governments of Spain and the United States, while others would probably discuss the question on its real merits.

It was at first expected by many that the President, as well as those of the Republican leaders with whom party success is the supreme object, would eagerly seize upon a foreign war to divert the attention of the country from the Crédit-Mobilier disclosures, the back-pay business, and several other untoward occurrences which had so seriously embarrassed the ruling party, and also to neutralize the evil effects which the financial crisis had produced on the popular mind. The opportunity seemed indeed very seductive. It is interesting to observe the curious reasoning by which the party leaders, especially those who think of themselves as possible candidates for the Presidential succession in 1876, arrived at the opposite conclusion. A war with Spain, they argue, would probably not be a very long one. Even if successful, it would produce very serious financial embarrassments. If it closed a year or two before the next Presidential election, the evil results would have disclosed themselves just in time to affect the popular mind, a reaction would set in at the most critical moment, and the party which conducted the war would be placed in a very precarious situation. There is certainly much good sense in this, and for once partisan shrewdness may have been of service to a good cause. The President himself, who has never devoted much attention to international law, is said to understand at least this feature of the case, and to prefer in this instance a diplomatic to a military triumph.

The defeats of the Republican party at the late State elections, as well as the farmers' movement and the financial crisis, have created an impression among the faithful that after all the party is mortal, and that something must be done to keep it alive. Honesty, economy, virtue generally, and "statesmanship" are in great demand. The eagerness of members of Congress to commend themselves to the good opinion of their countrymen by a vigorous condemnation of the "salary grab," and the repeal of the obnoxious law, is almost ludicrous to behold. In the Senate, Mr. Conkling made haste to vindicate himself by the introduction of a bill providing that the back-pay which had been drawn and turned over to General Spinner, or which had been left in the hands of the Secretary of the Senate, as Mr. Conkling had left his, subject to the disposition of the Senator or Representative entitled to it, be covered into the Treasury, beyond the reach of such Senator and Representative, as well as their respective heirs; and in the Republican caucus of the House, there was all the excitement of a race as to who should be ahead in moving the repeal. This is well as far as it goes. But the appointment of the committees exhibits the majority in both Houses as much in the old party "ruts" as before. It is true several Republican Senators decided that, in order to reunite all who had been Republicans on a common ground, it was time to throw off the narrow partisan spirit which had prevailed last year, and to invite the Liberals, especially Messrs. Sumner and Schurz, to the Republican caucus. This project, however, was defeated by the strict disciplinarians, especially, as rumor has it, by Chandler and Conkling, who insist that, according to the good old rule, "deserters must be shot"; but the reconciliationists succeeded at least in prevailing upon the caucus to assign the Liberals to positions on the committees instead of leaving them at the mercy of the Democrats. Thus the Liberals were put on committees between the Republicans and the Democrats, as a sort of middle party, and, as the irony of accident would have it, Mr. Sumner's name figures near the bottom of the Committee on Education and Labor, at the head of which stands Mr. Flannagan of Texas as chairman—the very caricature of a Senator, who can neither spell nor speak correctly, and whose ignorance and buffoonery are the amusement of the galleries. But Mr. Flannagan is a strict party man. It may have been intended as a concession to public opinion that the Committee on Civil Service and Retrenchment was revived, but upon the list of its members we find not a single active friend of civil-service reform, while almost all of them are experienced whitewashers who have already given ample proof of their proficiency in the business. No less significant is it that Mr. Stewart, who has more than once been taunted on the floor of the Senate with being the attorney of one of the Pacific Railroad companies, remains Chairman of the Committee on Pacific Railroads.

In the House no changes have been made that would materially alter the character of the committees. Neither the Crédit-Mobilier nor the back-pay scandal was permitted to affect their composition or the distribution of the chairmanships, and, in fact, they could not, without completely disorganizing the party. The Ways and Means Committee has a majority of protectionists; the Committee on Banking and Currency, more important than ever, is about equally divided between inflationists and advocates of specie payments, and General Butler remains chairman of the Judiciary, to expound the law to the House of Representatives. Evidently it requires more than a sudden impression that virtue is a necessity to reform an old party organization that has fallen under the control of bad elements. What legislation we may expect of this Congress nobody can predict. There is an unusually large proportion of new and inexperienced men in the House, many of whom will be apt to be handled like chess-figures by the old tricksters, unless an intelligent and vigorous pressure of public opinion upon them be kept up. In that way the success of jobs may be avoided, and the present fit of virtue may be prevented from exhausting itself in the repeal of the salary law.

As to the most important question, that of the currency, the cry for "more money" will undoubtedly be very strong in the House. There is some danger of the success of the inflationists there. The confused recommendations in the President's message have rather aided than weakened them, for they have been taught how to put forth loud professions in favor of specie payments, while practically advising an expansion of the currency. But, judging from present appearances, I think the inflationists will have to meet the most determined resistance in the Senate. That body has, as far as known, not yet been canvassed with regard to that question, but the opponents of expansion think themselves strong enough, even if no positive measure in the direction of specie payments can be carried, to prevent the passage of any inflation scheme. But there does not seem to be any probability of financial legislation being hurried through before Christmas, although the inflationists may make an attempt in the House. The Senate will have to take up the Louisiana case again—Mr. Pinchback, the late Governor, demanding admission as the Senator-elect of the Kellogg faction. The party whip will probably once more try its power on that occasion, as it has already done in the House. But I hear that the Kellogg faction in Louisiana will urge a new investigation, in which they expect to show up more clearly the fraudulent practices of Warmoth in conducting the election. In case the investigation is granted, some time may elapse before the Pinchback case is ripe for final decision.

THE MARSHAL AND THE ASSEMBLY.

PARIS, Nov. 20.

LAST night, at two o'clock, the powers of Marshal MacMahon were prolonged for the term of seven years, on the following conditions: The Marshal is now and will remain the mere delegate and servant of the Assembly, so long as the constitutional laws are not made. Among these laws there will be one on the powers and prerogative of the executive; and when this law has been voted, the Marshal will enter immediately upon the prerogative as defined by the Constituent Chamber. The national sovereignty is therefore intact; the representatives of the people are free to make the constitutional law or the executive as they like. The talk about a dictatorship seems therefore quite idle. The powers of MacMahon are defined in the present and will be defined for the future.

This solution will perhaps surprise many people out of France. It will not be well understood by those who start from abstract theoretical principles, and who do not take into consideration the very peculiar state of

France and the composition of the French Assembly. The most natural solution, in a logical sense, would have been this: Keep the Marshal in power on the actual terms of his tenure of office; during the *statu quo* make the constitutional laws; and, these laws once made, proceed to a presidential election, on the terms marked out by the law on the executive. This solution was advocated by moderate republicans like M. Laboulaye, on constitutional grounds, and was desired by M. Thiers and by M. Gambetta, because both expected that a presidential election, whatever rules might be devised for holding it, would not turn in favor of Marshal MacMahon. In ordinary circumstances, and admitting that the country was determined to establish republican institutions, the constitutional work was the only thing of importance, and there was no necessity of immediately trusting any man with the executive power for a number of years. But let us consider a moment what was the situation of the Chamber and of the country when the session began. The Comte de Paris had made his visit to the Comte de Chambord on the 5th of May; the fusion was complete between the two monarchical parties. They had adopted the same platform—representative government, equality of rights, the tricolor flag as a symbol of the abandonment of all privileges of the *ancien régime*. The monarchical party was conscious of its preponderance in the Chamber, and saw no further obstacle to the re-establishment of the monarchy. In the country, the expectation of the monarchy was only counterbalanced by the fear of the Comte de Chambord's disposition. His name was certainly unpopular, and the partial elections which took place turned in favor of republican candidates, less on account of any progress of republican ideas than because the electors thought it necessary to reinforce the Liberal element in a Chamber which was on the point of treating with the pretender. The negotiation began, and you know all its vicissitudes. At the very moment when everything seemed arranged, when the accord seemed complete between the representatives of the monarchical party and Henri V., the country was informed that it was the victim of an illusion, and the negotiations were broken off. Henri V. abdicated morally, if not formally. The country, notwithstanding its instinctive fear of the Bourbons, had become reconciled to the idea of the restoration, chiefly because it was thoroughly worn out and tired of political agitation. The uncertainty of the future, the dread of the Commune, the necessity of reorganizing the army and of placing France in a situation in which she could form alliances and resume her station in Europe—all these causes combined had rendered a solution of the political problem imperative.

During the last three years, not a step had really been made towards definitive institutions. In a country like France, so centralized, where everything depends on the executive, where there is no political force outside of the Government, incertitude is almost unbearable. It must always be borne in mind that France has no semi-independent states or provinces; that she is governed and administered by eighty-six prefects, who are the obedient agents of a Minister of the Interior; that this minister, politically speaking, is almost all-powerful. This organization has been the work of centuries. It was the historical task of Tocqueville to show that the great Revolution of 1789 really followed, in all administrative matters, the traditions of Richelieu, of Louis XIV.; that the prefects of Napoleon were only the successors of the intendants of the *Grand Roi*. Represent to yourselves in imagination a country where all the relations of life, with the exception of the family relations, are more or less controlled by the authority of a prefect. "Who is the new prefect?" is the great question asked in the provinces after each revolution. He comes from Paris (and under Louis XIV. it was already a rule not to send intendants to the provinces where they were born), unknown to the inhabitants. He is generally a lawyer; he is poor—that is to say, he has no fortune of his own; he enters the palace of the prefecture, generally the largest and handsomest building in the town; every office-holder of the department comes to pay him court; the general is under his orders; the bishop owes him the first call; the judges, the municipal officers, the gendarmes, the engineers of the Ponts-et-Chaussées, the professors of the university, the telegraph agents, surround him all the year round. He is more than a man, he is the law; he represents a new ideal, the *administration;* and in France, the tendency has always been to give to the state the superintendence of every department of social activity. The railways themselves will some day belong to the state, as they have not been conceded in perpetuity. The telegraphs, the high-roads, the schools, the hospitals, the public libraries, everything belongs to the state. I will not here compare the two systems—the system of self-government and the French administrative system; both have their advantages and their disadvantages. I will only say that, in the French system, the tenure of the executive power becomes a vital question for the country. As everything depends on what is called the administration, and as the administration is chosen by the executive, every change in the executive is a sort of revolution in the country. It is for this reason that so many Liberals in France would prefer a monarchy. Even under a monarchy, a change of cabinet has too disturbing an influence in the country; but a dynasty might become popular enough to allow the provinces more independence, and it is doubtful if the Republicans will ever consent to any diminution of the powers of the state. They have always been the most determined centralizers. After the 4th of September, the government of Gambetta would not even hear of elections. Gambetta felt that he represented the "République une et indivisible." He would have no one speak for Brittany or for Lorraine. The monarchy is impossible for the present; but as the monarchical hopes were chiefly a craving for the consolidation of the executive power, the prolongation of Marshal MacMahon's term was decided.

The idea originated with the Duc de Broglie; it was not altogether a new one. The friends of M. Thiers, while he was President, had at various times spoken of giving him a fixed tenure of office for three years; but the Assembly, even at the time when M. Thiers was its delegate, was always deaf to such a proposition. It was not so in the case of MacMahon. The Marshal, since the 24th May, had never made his appearance in the Chamber, he had never interfered personally in the debates; he had in reality played the part of a constitutional king, and given all the reality of power to the Duc de Broglie, keeping only for himself the duties of a reorganization of the army. If France could have no constitutional king, the thing which resembled it the most was MacMahon. Once in power for ten years or seven years, he would be, with the name of President, a real Regent or Lieutenant-General of the kingdom. The large majority which has been found to vote for the prolongation was ever ready to hinder the return of M. Thiers and of the Republicans to power. This majority is essentially conservative. This will explain to you why, after the letter of the Comte de Chambord, no attempt was made to recommence legally, so to speak, 1830—to place the Comte de Paris directly on the throne, or even to give the Regency to him or to some other member of his family. In the great agitation which followed the rupture of the negotiations with Henri V., these extremities were thought of for a moment, but they never were seriously entertained. There was a savor of revolution in them which displeased the greater part of the majority. The prolongation was a milder form of protest of the majority against the folly of the king. The time is past when a king was seized, shaven, and thrown into a monastery. Every Legitimist of common sense understood that the Comte de Chambord had destroyed himself. The Royalists, who were in the majority in the Chamber, who are honestly convinced that the triumph of the Republic in France can only prepare the triumph of the Commune and the dismemberment of the country, could not change all their ideas in a night and become converted by a sort of miracle to republicanism. The scheme of the prolongation became a sort of resting-place for all uneasy and disturbed minds. It was clearly stated in the message of Marshal MacMahon that the prolongation would be an extension of the truce of parties. Republicans and Monarchists can and will continue, under the stern government of a loyal soldier, who will be a servant of the law as he always was of his duty, to preserve their hopes for the ultimate triumph of their doctrines. If the Comte de Chambord should die, or should abdicate, the Monarchists would probably bring forward a proposition for the re-establishment of monarchy. It is confidently expected in the monarchical party that, in such a case, Marshal MacMahon would resign his functions, and would not offer any obstacle to a restoration. It is, perhaps, idle to make such suppositions; the Comte de Chambord is not likely to abdicate, and he is much younger than the Marshal.

Practically, the situation of France is now this: Marshal MacMahon will be a sort of constitutional king; he will preserve order with the greatest rigor, and order is the chief necessity for a country which has been deprived of two provinces, and convulsed by a civil war. The Chamber will continue to exercise its legislative and its constituent rights; it will constitute an Upper Chamber, and probably give an important part in it to the representatives of the departmental councils-general. This innovation will, in my opinion, have the most beneficial effect on the future of the country; it will stimulate the formation of local and provincial influences, while it will add lustre to the central government. The Chamber will also frame a new election law, and probably disfranchise all the electors who do not appear in the lists of the tax-gatherer, even for the trifling sum of three francs, which represents what is called the personal tax. A new municipal law will also be made. When all this is done, the Constituent Assembly will dissolve; and even if the electoral body return a Radical Chamber, which is very unlikely, the President, with the help of the Upper Chamber, will be able to counteract its action. It must not be supposed that MacMahon can be deposed by a new Chamber; he has been called to his new function by a constituent law—that is, by a law which cannot be changed during the term for which it has been made.

Correspondence.

THE ATTORNEY-GENERALSHIP.

To the Editor of the Nation:

Sir: We all look to your paper for speaking the truth and for correct notions, and are shocked at your saying the nomination of Mr. Williams for Chief-Justice is "respectable." No lawyer who has ever encountered him considers the nomination anything but discreditable, and it is made at a time when Mr. Williams's feebleness as a lawyer has been conspicuously demonstrated by his appearance in the Crédit-Mobilier suit, where he not merely failed to argue his own side tolerably, but did not know, and showed that he did not know, enough to appreciate the positions and arguments of the defendants, or to understand their force.

Your paragraph was a blow to your legal readers here; hence these lines, which I hope you will take kindly.—Yours truly, T. H.

Boston, December 5, 1873.

[We discussed Mr. Williams's appointment simply as the alternative of Mr. Conkling's, and supposed we had made this sufficiently clear. But we confess we are satisfied, from the remonstrances we have since received, that, little as we said for him, we said too much. We admitted that he was neither learned nor able, but we now believe he is not "respectable" in the best sense of that term, and that his appointment would be scandalous. We ought to add that Mr. Conkling has postponed the study of finance for the present, and is busily "working" for Mr. Williams's confirmation. The Administration papers still continue to hint that there *is* a subject on which Mr. Conkling could speak with authority. If they will only mention what it is—provided it is not mixed metaphor—we shall be all ears. "Authorities" are nowadays very scarce, and the public is eager for guidance.—Ed. Nation.]

CHURCH DISCIPLINE.

To the Editor of the Nation:

Sir: The *Nation* is almost invariably accurate and reliable, but the article in last week's issue on "Church Discipline" is based upon a singular misapprehension of facts. Neither Mr. Beecher nor Plymouth Church "hold that it is none of the church's business what a member's way of life is," nor that "enquiries into his morals and manners with the view of making him the subject of ecclesiastical discipline are futile and mischievous." It was not deemed advisable to exercise discipline in the particular case you refer to for several reasons, one of which was that the person had practically ceased to be a member four years previous; but the church made no such declaration of principles as your article attributes to it. The church merely asserted its own independence. The readers of the *Nation* have so much confidence in it that the article on "Church Discipline" is likely to mislead those not conversant with the facts. A. A. H.

New York, Dec. 8, 1873.

[We attributed no "declaration of principles" to the church. We commented on Mr. Beecher's speech, and pointed out what we conceived to be a legitimate deduction from his definition of the church's duty in the matter of discipline, as illustrated by its practice. We explained our position as well as we could without citing cases, which was not necessary for our purpose. Our article will "mislead no one who is conversant with the facts," and will enlighten, we hope, a good many who are not. It was written in aid of the great work of expelling canting knaves from organizations designed to promote religion and morality—a work which we hold to be the principal part of the reform movement of the day. We may add that, while believing Mr. Beecher to be seriously mistaken as to his duty in dealing with the wretched creatures who have been pestering him during the last year, we have no feelings to express towards him, under present circumstances, but sympathy and respect.—Ed. Nation.]

WHAT MAKING THE CURRENCY "ELASTIC" MEANS.

To the Editor of the Nation:

Sir: The popular fallacy of the day in the treatment of the currency question is the theory that if a new issue of legal-tender notes is made by the Government, convertible at the pleasure of the holder into bonds bearing interest at $3\frac{65}{100}$ per cent. and *vice versa*, the quality termed elasticity will be imparted to the currency.

In order to exhibit the entire futility, or worse, of the proposed method of imparting elasticity to our legal-tender currency, it is only necessary to recur once more to the true nature of the legal tender note. It is, as has so often been said, only an instrument by which the Government collected a forced loan. It is the dishonored promise of dollars forced into circulation by law in order that the Government might obtain the means to carry on war. It is to-day a lie and a fraud: a lie because it promises what the Government does not perform, and a fraud, because it is continued in forced circulation on the plea of necessity, after the need has ceased. The plan now proposed is to issue more legal-tender notes—that is, to collect a new forced loan. There is no pretence that the Government needs to borrow (its income is more than its expenditure), yet it is proposed that it shall borrow say one hundred millions, and force new legal-tender notes into circulation to that extent.

But how will it force these notes out? The revenue is ample and meets all expenses. The Government cannot lend these legal-tender notes; it wishes to buy nothing that it has not now the means to pay for. Then it can only get these proposed new notes into circulation by purchasing the five or six per cent. U. S. bonds now outstanding—there is absolutely no other possible course. The theory, therefore, is that the present six and five per cent. bonds will be sold to the Government at or about the present moderate premium by some one who wants legal-tender notes bearing no interest more than he wants bonds bearing five or six per cent. interest in gold; he is then to make use of these notes as money for a time, and it is to be presumed that such use will be at a rate of profit of more than five or six per cent. gold, else there will be no conversion; next, it is assumed that the rate of interest or profit will fall not only to 5 but even to $3\frac{65}{100}$ per cent., and the notes will return to the Treasury. If such a course were possible, all the recent successful and unsuccessful attempts to fund our six per cent. bonds at five per cent. have been useless, since on this new method it has needed only a moderate additional issue of dishonored promises, and the debt to the extent of such issue would either bear no interest at all or convert itself from six and five per cent. even down to $3\frac{65}{100}$ per cent. The very rate of interest proposed is evidence that the project is one that presumes ignorance, not only of the effect of the cheat, but also of the common rules for casting interest, for no people capable of estimating interest *except* at the rate of one cent a day on each hundred dollars could be tricked by such a device.

Let me repeat the process as it must work, if it works at all, in a business formula. Bear in mind that the new notes can only be got into circulation through the purchase of outstanding bonds (unless, indeed, the Secretary of the Treasury concludes to buy and store away a large sum in gold).

A wants money to pay debts with, and has or can obtain 10-40 five per cent. bonds, on which he cannot borrow legal-tender notes now in circulation, as money is scarce and the market rate of interest is high. He takes these bonds to the Treasury and sells at market price, say 108. For $10,000 of 10-40 bonds, bearing interest at 5 per cent. in gold, he gets $10,800 legal-tender notes bearing no interest; and these notes he forces upon his creditor B, under due process of law. This creditor B (or we may presume to call him B. F. B., the chief promoter of this fraudulent device), having been forced to accept these new notes thus added to the volume of the currency, passes them to D, a distinguished New York banker, also an advocate of the plan; and as D can no longer find a use for the notes, either in building railroads or selling dry-goods, and cannot find any one to whom he can lend them at over $3\frac{65}{100}$ per cent. interest in currency, he takes them to the Treasury and converts them into bonds at that rate!

The course of the new notes may be short or long; they may be funded by D, or they may be paid out by him upon some railroad enterprise, and finally get into a savings-bank, and thence into the Treasury; but they cannot get out of the Treasury except in exchange for a five or six per cent. gold bond; and they cannot get in except by conversion into a $3\frac{65}{100}$ currency bond. In other words, if the thing is done at all, it will be done by the Government issuing, at the present market rate of its five per cents, evidence of debt for $10,800 for each $10,000 of debt bought in, and then converting this evidence of debt for $10,800 into another form for the same amount at $3\frac{65}{100}$ per cent. interest. Every such issue will increase the aggregate amount of debt, and it can only diminish the burden of interest upon the supposition that the community consists entirely of knaves or fools—knaves who will authorize or promote the issue of more lying and cheating promises of a dishonored Government, and fools who would reconvert them into other promises of the same Government at a lower rate of interest than has ever prevailed in the United States on the safest mortgage of real pro-

perty. The fact would be that any such new issue of legal-tender notes would be at once absorbed by the rise in prices sure to follow; and as such a breach of trust as the collection of a forced loan in time of peace would impair if it did not altogether destroy confidence, the rate of interest would rise instead of falling, since every owner of real capital in land or merchandise would refuse to part with it except he charged, in addition to the interest for its use, a full guarantee against further fraud or ultimate repudiation on the part of the Government.

This scheme is nothing but the old greenback device in a new form, promoted by the same advocates, and as sure to result in making the rich richer and the poor poorer. It is another proposition to pick the pockets of the people under due process of law, and to cheat the ignorant under the false pretence of making money plenty and cheap. If such an act is done, it will prove that the late panic has ended too soon and has not been severe enough. It has been apparent for many months that this nation is not to be taught the need of using good money by any teaching except the disaster which surely follows the use of bad money, and that Congress will not cease from reissuing counterfeit dollars until the mass of the people have learned that they have been cheated by the hard pinch of want. If the lesson of the last two months has not been severe enough, it may be our fate to have another legal fraud perpetrated upon us before the final retribution comes.

NEW ENGLANDER.

BOSTON, December 1, 1873.

Notes.

G. P. PUTNAM'S SONS will add to their 'Handy-Book Series' a volume containing a detailed record of the administration of our Government from 1776 to 1873, and entitled 'Hand-Book of Statistics of the United States.' It has been compiled by Mr. M. C. Spaulding. To their series of 'Popular Manuals' they will add a plain account, partly historical, of 'Women before the Law,' by Prof. John Proffat.——J. B. Lippincott & Co. will shortly issue the 'History of English Institutions,' by Philip V. Smith, and 'The Border-Land of Science,' by Richard N. Proctor.——L. W. Schmidt, 24 Barclay Street, announces that, after January 1, he will add to his customary importations of books from England, Germany, and France regular weekly shipments from Italy. This is, we believe, the first attempt on the part of our foreign booksellers to keep the reading public *au courant* with Italian literature as with German and French, and we hope it will be sustained.——Karl Knortz is publishing in *Der Deutsche Pionier*, of Cincinnati, extracts from David Zeisberger's journal, from the original MS. in the possession of the Ohio Historical and Philosophical Society. The journal has never been edited before.——The Surgeon-General's Report, U.S.A., states that the second volume of the 'Medical and Surgical History of the War' is rapidly passing through the press, and that the edition of the first volume has proved insufficient to supply the demand for it from ex-medical officers who served through the late war. The library of the Army Medical Museum now contains about 25,000 volumes and 15,000 pamphlets, and is rapidly growing in importance.——J. W. Bouton will publish the work on which the late Mr. J. C. Hotten was engaged at the time of his death, namely, 'Original List of Emigrants, etc., who went from Great Britain to the American Plantations, 1600–1700.' Also the following: 'Lost Beauties of the English Language'; 'Ireland's Shakespeare Forgeries'; and 'The Story of the Stick, in all Ages and Lands.'——Rev. Thomas Vickers has, after a sharp contest, been appointed Mr. W. F. Poole's successor in the Cincinnati Public Library.

—John H. Carmany & Co., San Francisco, have nearly ready for publication a book of some importance and interest to naturalists, on the natural history of the whale, by Captain Charles M. Scammon, of the Revenue Marine. The title of the book is 'The Marine Mammals of the Northwestern Coast of North America; together with an account of the American Whalefishery.' It is in shape a large quarto, which has enabled Captain Scammon to give lithographic representations of the different varieties of whales and seals, drawn to scale; and these are very carefully and admirably done, and will present to the view of naturalists probably the most perfect representations of these immense mammals which have ever been made. Captain Scammon has been for many years engaged in the collection of material for the work, and has brought together a large quantity of new and valuable information concerning the habits of whales, of which but little is generally known, as well as of their food, their diseases, etc. The book is to be sold by subscription only, we understand, and it will make its way into the libraries of lovers and students of natural history as one of the few scientific treatises on its subject, and the most complete and correct of the number.

—The New York *Independent* has just been celebrating its twenty-fifth anniversary, and, for a paper of its venerable age and its religious turn of mind, some of its conduct on its birthday was peculiar. Its treatment of the Rev. Justin D. Fulton, for instance, appears to reveal a settled conviction that branding on the forehead and subsequent deportation to a desolate island are the treatment best adapted to the case of that divine. The closing sentence of the article devoted to the doctor is not the severest thing in it, but even that is as follows: "Just why a man of Mr. Saunders's self-respect has withdrawn from Dr. Fulton's paper Mr. Saunders has not informed us; but we can surmise." The reader, it will be seen, has liberty to surmise too; but not many of the persons who put themselves to that trouble will frame the hypothesis, after reading the *Independent's* remarks, that Mr. Saunders's real reason for withdrawing from the paper was his belief that Dr. Fulton is far too good for mere man to associate with. According to the writer's assertions in the preceding part of his article, Mr. Saunders probably withdraws for a cause very remote in character from the one suggested: "We do not wish to insist," he says, "in any hypercritical spirit that the eminent pastor of the Hanson-Place church should always confine himself to the truth. That, indeed, would be requiring altogether too much." That Dr. Fulton came into these parts from Boston is dimly alluded to in the following words: "There is in this region a vulgar prejudice in favor of veracity which must sometimes be conciliated," and in view of this fact the writer suggests to his Massachusetts friend "that he should be careful not to make statements which everybody knows to be the reverse of true." As for the facts about the Mr. Saunders above-mentioned, they turn out to be something like this: Saunders withdraws from Fulton's paper, taking with him, unless the *Independent* is mistaken, "the single element of respectability which that journal has hitherto possessed." Upon this Fulton remarks in what seems rather irrelevant language that Saunders greatly disliked one Pentecost, Fulton's predecessor—and, as we are led to suspect, a heretic—but that Saunders is very fond of Fulton by reason of Fulton's superiority to Pentecost in matters of doctrine. But, to use the language of the *Independent*, Fulton, in making this statement, speaks "the thing that is not," and the fact is that it is Pentecost and not Fulton who has Mr. Saunders's sympathy. "Close communion" or "open communion" is, we believe, the question at issue between Dr. Pentecost and his opponents. So the thing goes on, and a pleasant sight it is to see. It is with envy, by the bye, that we note one weapon in use among religious journalists—who often are clergymen—which secular members of the craft do not possess, although they have one like it. But our clerical brethren have this and another beside. They can not only charge each other with editing a paper which is rapidly falling off in circulation—a time-honored device constantly in use—but they can also add that the reverend slanderer on the other side, the more he preaches on Sundays, the more he empties the pews: "The pew-rental of the society," says the *Independent*, "has been reduced by about one-half since the resignation of Dr. Pentecost," and since Dr. Fulton came in. Clearly the lay editor is here at a disadvantage. The enemies of Deacon Richard Smith, the Cincinnati editor, might, in consideration of his hybrid condition, he being a deacon, perhaps make some use of this engine; but, in the nature of things, it cannot be employed by the profession generally.

—So many old stories of heroic phrases and death-bed utterances have been exploded by the researches of modern criticism, that it is pleasing to find at least one the truth of which is even better than the current fiction. American coin-collectors are generally familiar with the copper tokens which, in the pre-nickel days, passed in the currency as cents, bearing, some one inscription, some another, and issued, in most cases, we believe, from no regular mint, or, at any rate, not issued in the usual way. Among these tokens was one which bore the inscription, very impressive to the non-adult population, "Millions for defence, not one cent for tribute"—an inscription which seemed in those days to describe with happy accuracy the position which the American citizen ought to take with regard to taxation for certain purposes. The story was that General Pinckney, Minister to France from the United States during the Administration of John Adams, was approached by M. de la Croix, who wished to have it understood that certain diplomatic questions then at issue between the two Governments could be more easily settled by the payment of a sum of money than in any other way. Upon this, according to the tradition, General Pinckney very melodramatically drew himself up and cried: "Millions for defence, not one cent for tribute." It seems, however, that what he did say was, "Not a penny, not a penny"; a reply better every way. This, at least, is the way in which he himself told the story, being asked long afterwards for a correct version at a meeting of a club to which he belonged in Charleston. It seems singular that the truth of the matter should not have come out before. In "Millions for defence, not one cent for tribute" an eagle-scream makes itself audible which would have sounded

strangely enough in the ears of the gentlemen of General Pinckney's generation.

—There has been some talk recently in England of a suit for libel against the *Pall Mall Gazette* by Mr. Gilbert, author of "Pygmalion and Galatea," "The Palace of Truth," and the "Wicked World." The action is for libel in permitting the publication of some remarks characterizing the "Wicked World" as a play of doubtful decency. The plot of the "Wicked World," which has recently been acting in New York, is pretty, and if there is anything of an immoral tendency in it it must be put there by the actors—an easy thing for even the most unskilful performer to do. The plot is this: The fairies of both sexes, inhabiting an abode of their own in cloud-land, are happy and good. They are apparently coeducated, but coeducation in fairyland leads only to the happiest results, for neither *Darine, Selene, Phyllon, Ethais,* nor any of the others, are tormented by human love, or indeed by any human feelings, except such as are good. They lead harmless lives, knowing neither hate, nor fear, nor jealousy, nor revenge, nor ambition; but only filled with a pure affection for one another, and pity for the wicked world beneath them, with its suffering, struggling, and unhappy inhabitants Each of the fairies is the antitype of some one on earth who bears the same name, and resembles him or her in everything save virtue. The fairies have the power of summoning among them the human beings who bear this resemblance, but if they do so they entail upon themselves certain consequences of the most lamentable kind. They will then know what human love is, and, knowing this, they will cease to be happy. Of course their discussion of the subject ends with a summons, the fairies having convinced themselves that they will be able to do the mortals whom they summon much good by the example of their own goodness. The result is easy to anticipate. *Phyllon* and *Ethais,* who are represented as mediæval knights, ascend from the earth, and, true to their instincts, as soon as they appear in fairyland begin to brawl, bluster, and fight. The fairies at once fall in love with them, and hence ensue jealousy, hate, tears, revenge, quarrels of the most internecine kind. In the end, the two knights, who care for nothing in reality but fighting, and regard woman, even when she is a fairy, as "a mere toy," suddenly return to earth, and leave the deserted fairies, for the moment, heart-broken. They recover their spirits in a measure, however, before the curtain falls, and vow that they have had enough of human love, and will hereafter remain faithful to the institutions and principles of fairyland. Although the plot is so unlike, the sentiment resembles that of "Pygmalion and Galatea," and although the plot is astonishingly unreal, the success of the play as a whole—for it has been very popular both in England and in this country—is a striking proof how very sentimental people remain at bottom notwithstanding all our talk about realism and the disinclination of the age for anything which carries it an inch aside from the beaten path of progress and the nineteenth century. It would be well for those playwrights who spend their time in devising means for making the stage more and more a facsimile reproduction of an age whose prominent features are not picturesque, but decidedly prosaic, to ask themselves seriously what is the reason that such plays as "Pygmalion and Galatea" and the "Wicked World"—with all their faults and their unreality—interest the public.

—In our recent notice of Mrs. Grote's memoir of the gentleman whom she habitually describes as her "partner," considerations of space prevented us from paying due attention to the lady herself. The work, in fact, may fairly be called an autobiography of Mrs. Grote, interspersed with anecdotes of the historian of Greece. There is an old dictum of Aristotle's that "the magnanimous man thinks well of himself because he deserves to be well thought of." Each part of the definition exactly applies to her. There is, it is true, no direct, vulgar vaunting of her virtues; but she lays her merits calmly, honestly, and without any reticence, before the reader as things which ought to be known in order to understand the life of the historian. Thus, she frankly communicates to the public the details of Grote's courtship, with a freedom with which such matters are not often told to intimate friends. She prints, without a word of comment, a letter of George Grote's, in which he states that "she looked lovely beyond expression; her features still retained the same life and soul which once did so magnetize me; I never have seen it, and I never shall see it, on any other face"; and pours out all those expressions of admiration which lover after lover has written, but which are not commonly published for the edification of cold and unimpassioned readers. In the same way, the wretched baseness of a certain Mr. E., described as a "monster" who attempted to separate the lovers, is painted with an animation which reminds one strongly of the pages of a novel. We doubtless owe these details, not to vanity, but to the interest which Mrs. Grote feels in everything concerning herself, and which is so genuine that she contrives to communicate it to her readers. Her affection and admiration for her husband, her zeal in promoting his success, and the keen sympathy which she felt in his triumphs, are made as clear as day. But, at the same time, it is impossible not to feel that the lady has the most ardent desire that the public should recognize her share in his achievements. The different forms in which this tendency to self-assertion comes out are amusing and characteristic. There is, for instance, every reason to suppose that Mr. and Mrs. Grote, being throughout life warmly attached to one another, arranged their domestic affairs much after the manner of other affectionate husbands and wives; but the tone Mrs. Grote takes suggests the idea that every arrangement was the result of distinct negotiations between friendly but independent powers. In 1824, "George Grote consented to take his sister to Scotland, and his wife being willing to accompany him, they all made the voyage by sea," etc. "Mrs. Grote," again, "had numerous friends and connections among the aristocratic portion of society, and her inclination would fain have led her to cultivate their sympathies by frequenting their houses; but the aversion, at this early period of his life, to everything tinctured with aristocratic tastes and forms of opinion which animated George Grote's mind, obliged his wife to relinquish her intercourse with almost all families of rank and position rather than displease her somewhat intolerant partner." This sentence is in many ways typical of Mrs. Grote's manner. Throughout the book there are clear intimations that, unlimited as is her admiration for the historian, she yet feels that there are matters which she understood far better than he did, and that she was constantly a sacrifice to her sense of duty.

—That Mrs. Grote, however, deserves to be well thought of there can be no doubt. What makes her remarkable is neither cultivation, nor subtlety, nor originality, but an extraordinary amount of vigor, and what, for want of a better term, may be designated as individuality. It is to this vigor of life that her successes, both as a wife and an authoress, must be ascribed. In both capacities she achieved great results. To her is due the suggestion of the work in which Grote's powers found their real field. In the year 1823 Mrs. Grote, hearing the subject of Grecian history frequently discussed, and being well aware "how attractive the study was in her husband's eyes, thought it would be a fitting undertaking for him to write a new history of Greece himself. Accordingly she propounded this view to George Grote: 'You are always studying the ancients whenever you have a moment's leisure; now, here would be a fine subject for you to treat; suppose you try your hand?'" No one can wonder that Mrs. Grote announces with a certain solemnity her suggestion, which "seemed acceptable to the young student," and, in fact, fixed his intellectual career. No one can doubt that Mrs. Grote has a right to ascribe to herself, in great part, the credit of this suggestion being carried out with success. What were the value of her literary criticisms we have no means of judging, but a very little reflection on the great risk to which the labors of a highly cultivated scholar are constantly exposed of being rendered abortive by his own diffidence and intellectual squeamishness, will suggest that Grote owed a great deal to the fact that he had constantly by his side a companion whose warm interest in his fame made her absolutely determined that his labors should produce a definite, tangible result. In 1831, Mrs. Grote was already resolved that the "History of Greece *must* be given to the public before he can embark in any active scheme of a political kind." In 1833, she was obviously alarmed because "Grote did not apply himself, as I earnestly besought him, to the furtherance of his history during the winter, but permitted himself to graze all the field of letters." She further carried through all the negotiations with the publishers, and in every way relieved her husband from any unnecessary burdens which might interfere with his undertaking. When, in 1855, the twelfth volume was published, and the bowl of punch brewed at "History Hut" in celebration of the *opus magnum,* one can easily understand how Grote himself sipped the "delicious mixture with great satisfaction, whilst Mrs. Grote sat by and descanted on the happiness of our living to see this day."

—The excavations and discoveries by Herr Schliemann on the site of ancient Troy have attracted much attention, and few are unaware of the alleged discovery of the very ornaments and regalia of Priam. A letter from Athens in *Im Neuen Reich* (No. 41) casts doubt, not upon the discoveries, but upon Herr Schliemann's interpretation of them. Many of us, no doubt, have considered that it was hardly likely the substructions were labelled "Troy," or that the gold ornaments bore the name of Priam or Hecuba. This writer scouts altogether "der ganze trojanische Spuk"; says that the localities do not correspond at all with Homer's descriptions; and that the objects of art mostly belong to a later period, probably not before the time of the Diadochi. Another paragraph in the same number speaks of the German enterprise for excavations at Olympia, where valuable remains must exist, as it was for centuries the great repertory of works of Grecian art, and very little has been attempted there in modern times. The foundations of the temple of Zeus, discovered by the French in 1829, will afford a sure starting-point.

HADLEY'S ESSAYS.*

FEW books have as much in them to praise and as little to find fault with as Professor Hadley's 'Essays.' Not that they are so very brilliant or so very profound for these times of evolution and revolution, when your critic kills me three or four systems of the universe at a breakfast. One may read almost any of these articles with quiet interest and pleased assent without thinking it anything great. But the scholar who is competent to judge will be impressed, as he reads one after another, with the wide range of reading and reflection and the sound sense and comprehensive judgment which are everywhere shown in them. He will recognize a judicial mind of the best type, with no prejudices, clear, bright, penetrating, able to weigh the finest grain of evidence, able to set in luminous order the most complicated collection of facts and arguments, and, withal, kindly and cordial, glad to see merit and prompt to praise it. Most of these essays were prepared for some learned society or periodical; but they are, if not exactly popular, certainly very pleasant and easy reading. One reason is that they are so elementary. Whatever Professor Hadley discusses, he begins at the beginning, and supplies all the facts as he goes along which are necessary to understand him. The profound article in which he announced a new general law of the Greek accent to the American Philological Association, and which has been translated and printed in Germany by G. Curtius, begins with such full elementary statements and goes on with such simple illustrations that any one may read it with intelligent interest, though he had not before so much as heard of accent. So, when he speaks of consulting Ulfilas, he specifies "the translation of the Bible made by Bishop Ulfilas in the fourth century for his Mœso-Gothic countrymen"; and speaking of the seven wonders of the world, he names them all. Then, in his diction and the structure of his sentences, he is quite simple and pure, and flows along as though he had never read a Greek book, or perhaps we should say as though he never read anything but Greek, and Xenophon at that.

Many of the essays are summaries of the state of the question on some important point of scholarship. They are full of matter as an egg is of meat. They abound especially in clear and authoritative solutions of the difficulties most familiar to teachers of language. These are by no means confined to the Greek language. Great Greek scholar as Professor Hadley was, he seems to have studied English and its antecedents even more than Greek. The "Brief History of the English Language" which he contributed to the Webster 'Dictionary' is as perfect in its kind as his 'Greek Grammar,' and has more original research behind it. Certainly no teacher or student of English can afford to be without this book of essays. Here, for example, is an article of twenty pages on the English possessive case. Observant readers of our older literature often think that they know the ending *'s* to be a contraction of *his*; they have seen it printed in full, "*John his book*, "*Vincentio his son*," in the 'Spectator,' Shakespeare, and all the way back to Chaucer. Those who know a little Anglo-Saxon, notice that its genitive often ends in *—es*, like the Latin *—is* and Greek *—os*, and they pronounce the *his* theory ridiculous. Both should read Professor Hadley. The contemptuous Anglo-Saxon especially, though right in substance, may be benefited by learning how common the separate *his* was in late Anglo-Saxon or Semi-Saxon, and how often the colloquial dialects of Germany have formed similar collocations of undoubted pronouns: *dem Mann sein Name* for *des Mannes Name*, the man's name; *Frau Wolf ihre Töchter*, Mrs. Wolf her daughters, and the like. Professor Hadley had not observed that similar forms now and then occur in Anglo-Saxon proper, and with other pronouns than *his* in old English: *Gode his name cigdan*, they called on God his name (Ps. xcviii. 6), *Pallas her glass* for *Pallas's glass*, in Bacon.

Professor Hadley was, above all things, a philosophical grammarian and philologist, a worker in the scientific history of speech. He had, of course, made a special study of the growth of inflections. Besides the article on the English possessive just referred to, there are similar essays in this volume on "the Greek genitive as an ablative case," "the formation of Indo-European futures," "passive formations," and "the Latin subjunctive," all of them admirable illustrations of the use of the historical method by a thoroughly logical mind. One who has mastered them will have a good knowledge of the nature of inflections, and of a large number of the most noteworthy forms in the Indo-European languages, with occasional specimens from the tongues of all the outlying barbarians. In the interesting and learned essay on "passive formations," the new continued passive in English is discussed.

"In one auxiliary formation," he says, "this double use as active or passive belongs to the established idiom of our language. We say 'he is building the house' and 'the house is building'; 'while he was doing these things' and 'while these things were doing.' It is in order to avoid the ambiguity of this form that men have latterly begun to say 'the house is being built,' 'these things were being done.' These forms of the continued passive have had to undergo much severe criticism, and it can hardly be denied that they are somewhat illogical, and perhaps yet more unwieldy. Still, they have their convenience. Probably there is no man who, if the fear of the grammarians were taken from him, would not occasionally use them. Like other things which are homely and useful, they will be likely to maintain themselves against all opposition, at least in the language of conversation and extemporaneous speaking, and may possibly gain a place at last even in polite literature."

This was written in 1867, and the form has already gained a place in polite literature. It has crept into the 'Earthly Paradise,' and is quite at home in Froude and the whole generation of growing celebrities in England. And, now that it has lost the uncouthness of a new fashion, one of the new time may venture to say that, when compared with our other auxiliary formations, it is not markedly ungainly, and that the steps by which we have arrived at it have been quite natural and logical. It is the habit of our times to think much of action as continuous, to study development and progress and the like. This habit of thought leads to habits of expression discriminating continuous forms, passive no less than active. When people came to be saying at every breath, "they are entertaining him," "they are tormenting him," and the like, they were sure soon to say, "he is being entertained," "he is being tormented." The participle "being entertained" is, to be sure, a modern form, and has not in its most familiar uses fully attained the expression of continuous action which is so prominent in the active "entertaining"; but that expression belongs of right to the ending *-ing*, and the verb *be* has a hereditary claim to be associated in the expression, not only from its Indo-European meaning of *growing, becoming*, but also from its Anglo-Saxon use as a future in distinction from the stricter present, *am, is, are*. The so-called ambiguous form, according to which we are to say "he is entertaining," when we mean "he is being entertained," "receiving entertainment," never has been in familiar use, except in a few phrases. The passive form of thought in other cases was idiomatically expressed, or suppressed, by circumlocutions of one sort or another, or by changing the verb altogether. The new form is a great gain to our language.

The attention of Prof. Hadley was long and strongly drawn to those laws of speech which depend on the nature of sound and voice. He had a sensitive ear and flexible organs of speech, with every aptitude for this kind of investigation, and his work in it is the most original and fruitful which is recorded in this volume. There are articles on "Ancient Greek Rhythm and Metre," "The Nature and Theory of the Greek Accent," "The Byzantine Greek Pronunciation," "Indo-European Aspirates," "Bekker's Digammated Homer," "Ellis's Early English Pronunciation," "English Vowel Quantity in the XIIIth Century and the XIXth," "English Orthography." Some of these are in the main learned summaries, but others are work on fresh facts. The most conspicuous are those on "Greek Accent" and on "English Vowel Quantity." The former presents a comprehensive classification of the well-known rules of Greek accent, stated in the form of a causal law, which also serves as a hypothesis to connect the Sanskrit accentuation with the Greek. The hypothesis leaves a distinctively Greek "fondness for a particular succession of tones at the end of a word" as the cause of the prevalence of that succession. Such a "fondness" needs a detailed demonstration of its development, or historical grounding from some other source, to be admitted a *vera causa*, and Professor Hadley, had he lived, might well have continued and completed so important an investigation. His belief that stress did not accompany the change of pitch on the accented syllable in Greek is hard to accept, strong as is the negative evidence in favor of it. The changes of sound, especially of vowel-sound, produced by the accent in Sanskrit and Latin, and the known stress-accent in other Indo-European tongues and in modern Greek, make it seem almost certain to us that pitch and stress were never completely separated, even in Greek, however strongly pitch may have at one time predominated.

The article on English vowel-quantity is an exposition of the relations between the language of the 'Ormulum' and our present English. It shows that the quantity of the Anglo-Saxon words in our language has been preserved during great changes in the vowel sounds, thus suggesting the most subtle questions as to the nature of speech. Is time a more constant quantity than articulation? How about the Romanic side of English?

The study which Professor Hadley had given to these subjects makes his judgment worthy of the most serious consideration on all points connected with English orthography. Our popular writers, and some makers of schoolbooks who ought to know better, still go on making prejudice in behalf of our "shocking" spelling, as Professor Hadley calls it, by repeating the sayings of literary amateurs in its favor. The great philologist speaks of it more than once.

* 'Essays Philological and Critical, selected from the Papers of James Hadley, LL.D., Professor of Greek in Yale College; President of the American Oriental Society; Vice-President of the American Philological Association; Member of the National Academy of Sciences, etc.' New York: Holt & Williams. 1873.

"Franklin used to say that what we call false spelling of the vulgar was really true spelling. I do not know that I should say that, for vulgar spelling is sometimes most ingeniously absurd. But I certainly feel a good deal of hesitation about saying in regard to any man that he spells badly; I say that he does not spell like most of us; he spells singularly, peculiarly; but I do not see, on the whole, that he spells worse than the spelling-books and newspapers," p. 354. "The objections commonly urged against a new system of phonography have in my view very little weight." "But I will go further, and say that the wants of the philologist require a different system. What is important for him is that he should know the condition of a language at any given period of the past, that he may be able to trace it through its successive changes to its latest form. Now, in doing this he must depend mainly on the spelling, the writing; if this be maintained invariable from age to age amid all mutations of spoken words, the philologist is deprived of his most serviceable guide," p. 356.

Professor Hadley's scheme for printing an edition of Chaucer for popular reading may perhaps attract the attention of editors and publishers. The leading thought is to spell all words in the modern way, but when the metre requires a letter now silent to be sounded to put two dots over it, and if a word has a syllable not printed at all in modern spelling, denote it by an inverted apostrophe. The 'Canterbury Tales' would begin thus:

> "When that April' with his shower's sweet
> The drought of March hath piercëd to the root,
> And bathëd every vein in such liquór,
> Of which virtüe engendered is the flower."

This, he says, would be treating Chaucer as we do Shakespeare. It is worth trying in books of extracts and literary lectures; but it would not answer for the careful study of Chaucer and other Early English which is becoming common in our schools and colleges, and brings with it urgent need of a uniform phonetic spelling of the early texts at once reasonable and historical, like that used by Mr. Ellis. And, indeed, any extension of the use of our shocking modern orthography is much to be deprecated.

There are more articles, twenty in all. One is on the theory of E. Curtius, that the Ionians were Asiatics, whose central hive and real headquarters continued to be in Asia, while their colonies settled at Athens and elsewhere on the shores of Greece. One is on the number seven, a playful and, at the same time, really learned and interesting discussion of the prevalence of this sacred number. It contains an enumeration of the sevens in the Iliad and Odyssey, a description of those in Sanskrit, the hundred sevens of Persia, the three hundred and eighty-three of the Bible, the sevens of the Mohammedans, the sevens of Shakespeare, and then reasons as plenty as blackberries, chronological, physiological, arithmetical, astronomical. One is on Tennyson's Princess, appreciative throughout, though rather apologetic, the best part of which is the discussion of the metres and the labored diction of the poet. There are also articles on the chronology of the Hebrews, and the language of Palestine at the time of Christ, and a number of decisions of college class disputes. The last are admitted to the book as a memorial volume "in response to wishes warmly expressed from various quarters," though they were written "*currente calamo* and without special preparation, and in no case revised or corrected. Their author, doubtless, would never have thought of such a thing as making any of them public." We confess we turned to them the first thing, in the hope of finding the free expression of many delightful personal traits. It was not, perhaps, a reasonable hope in view of the nature of the exercise. At any rate, we were somewhat disappointed. The papers on Byron and that on vegetable diet have a biographical touch or two, and we find some evidence in the talk on day-dreaming that Professor Hadley's surpassing accuracy was not due to any mysterious memory, but was a matter of caution and love of truth, as with other men; it contains a familiar quotation from Wordsworth misquoted, not very badly, and which would not have been misquoted if he had read the proofs. But in general these lighter papers are valuable mainly for the same traits as those which are more labored, for the truth and sound sense which they contain. Professor Hadley was so absorbed an observer, and saw things so clearly, that he speaks merely as the mouthpiece of the truth; all personal categories seem foreign to him; he is dry light, pure, sweet—sweetness and light, if ever a man was.

We should have liked to find minute accounts of the traits and habits of study and teaching of our great scholar and instructor. A memorial volume seems hardly complete without them, and without his portrait. The appreciative preface of Professor Whitney tells us that he died on the 14th of November, 1872, in the fifty-second year of his age, that he had been for twenty-seven years an instructor in Yale College, and that "he was, in the opinion of all who knew him most fully, America's best and soundest philologist." Men of sovereign judgment, who live in the midst of great libraries, are apt to ripen slowly to public utterance. A look at the later papers of this collection makes it plain that Professor Hadley had just entered on a new period of pleasant publication of original investigations. The ripe fruit was beginning to drop freely. And then he died. No philosophy can keep such a death from seeming sad and strange.

CHILDREN'S HOLIDAY BOOKS—III.*

IT is eight years since 'Hans Brinker' was first published, and there is no good reason why it should not be in active circulation eight years hence. The story is, as we remarked at the time of its appearance, appropriate to the holiday season, yet independent of it. It will always furnish wholesome reading to the young, who will find in the skilful and natural development of character something to admire and to imitate, and for whom the descriptions of scenery and manners in Holland, and the tales from heroic Dutch history, will have an abiding charm. We should be troubled, indeed, to name any child's book written in this country which better deserves to be counted a classic. For this reason we make bold to reproach the publishers with putting at the front so bloodthirsty an illustration as that representing the capture by the boys of the robber at the *Red Lion* inn. It relates, of course, to one of the incidents of the narrative, but precisely the one which least needed illustration; and as frontispiece it conveys a false impression of the character of the story. And if we may grumble a little more about the pictures, we would point out how inferior they are in value (and would be, even if intrinsically of far greater artistic merit) to as many photographic illustrations of life in Holland. We hope that the success of 'Hans Brinker' under its new imprint will be such as to justify the publishers in preparing next year an edition somewhat more attractive typographically, and adorned with autotype views of dykes, and canals, and windmills, and skaters, and town-halls, and perhaps a portrait or two of the old-time Dutch worthies whose deeds are recounted by Mrs. Dodge.

Perhaps we ought not to class 'Buzz a Buzz' among the books intended for children, though we observe that this has been done by others, remembering, probably, Herr Busch's 'Max and Moritz.' The latter is not in our opinion, a fit child's book, and 'Buzz a Buzz,' of which the humor is even coarser, still less. There is a certain grossness of exaggeration in Busch's designs which grown folks occasionally find it hard to stomach, even when the incidents are not inherently vulgar. Some of the incidents in 'Buzz a Buzz' are of this description, and parents of ordinary refinement, if they smile at the representations at all, will be careful not to do so in the presence of their children.

Of quite a different character are the designs in 'Good Little Children,' 'Maggie's Mistake,' and 'Little Laddie,' from the sympathetic pencil of L. Frölich. The style of this artist is now so familiar to every one that it is hardly necessary to speak of it, except, perhaps, to observe that, while it retains all its old spirit and excellence of conception of children, it shows a tendency to exaggerate in drawing, making the heads immense and the necks and chests painfully small. But he is, as usual, a large part if not the chief attraction of the books he illustrates. In 'Good Little Children,' the only text is the titles underneath the pictures—each of which occupies a page—which run: "Good little children never say 'No' when they ought to say 'Yes,' nor 'Yes' when they ought to say 'No.' It is a dreadful thing to tell stories." Or, "When good little children are asked to repeat a little poem or a little fable, they say it prettily, at once." Or, "Good little children finish their soup to the last spoonful, but they never tilt their plates in this way." The whole thing is very pleasant and attractive, and ought to be a complete seduction into the paths of virtue for the most abandoned infant.

'Davie and Dot' is a companion piece to 'Good Little Children,' the text being rather more extended and equally happy; the pictures rather fewer, and, to our taste, not so attractive. The simplicity of the little ones in these designs is studied instead of instinctive, and the posturing and dressing are too theatrical. A picture freest from these defects is the one described beneath: "This is the best way to do it. Dot holds the nail, and then Davie can take both hands to the hammer. Now for a good blow right on the head of the nail."

'Maggie's Mistake' is an admirably conceived school-girl's story. Its autobiographical form, instead of being a drawback, as it is apt to be in

* 'Hans Brinker; or, The Silver Skates. A Story of Life in Holland. By Mary Mapes Dodge. Illustrated by Darley, Nast, and others.' New York: Scribner, Armstrong & Co.

'Buzz a Buzz; or, The Bees. Translated from the German of Wilhelm Busch. By Hezekiah Watkins. With the original German illustrations, and 28 original designs by Park Benjamin.' New York: Henry Holt & Co.

'Good Little Children. Adapted from the French of P. J. Stahl. With thirty-two illustrations from designs by Lorenz Frölich.' New York: Pott, Young & Co.

'Davie and Dot: their Pranks and Pastimes. Adapted from the French of P. J. Stahl. With twenty-four illustrations from designs by E. Froment.' New York: Pott, Young & Co.

'Maggie's Mistake: A School-girl's Story. By the author of 'Aunt Annie's Stories,' etc. With twenty-four illustrations by L. Frölich.' New York: Pott, Young & Co.

'Little Laddie. By the Author of 'Little Mother,' 'Little Rosy's Travels,' etc. With twenty-four illustrations by L. Frölich.' New York: Thomas Nelson & Sons.

'Sketches of Natural History; or, Songs of Animal Life. Written by Mary Howitt, and illustrated with upwards of One Hundred Drawings by H. Giacomelli, illustrator of 'The Bird,' by Michelet.' New York: T. Nelson & Sons.

'Rhoda Thornton's Girlhood. By Mrs. Mary E. Pratt.' Illustrated by C. G. Bush. Boston: Lee & Shepard.

'The Life of a Bear. His Birth, Education, and Adventures. With twenty-four Illustrations.' New York: Pott, Young & Co.

children's stories, here adds to the naïveté of the confessions and the liveliness and naturalness of the narrative. The author knows the small schoolgirl character well, and remembers with delightful accuracy the "ways that are dark and the tricks that are vain" of that class of little intense human beings. "Maggie," who tells the story, prides herself on being a "high-spirited" child, and thinks people don't know how to "manage" her. She is sent to the small and select boarding-school of Mrs. Comfort, who abandons the charge of her pupils to Miss Careless. A fine crop of bad habits springs up under this popular teacher, when she is deposed to make way for Miss Power. Under Miss Power things are very much altered. The girls determine in a body not to submit to the new rules, to remain "high-spirited," and not become like the good little girls in books—like Ellen, for instance, in the 'Wide, Wide World,' or Fleda in 'Queechy,' who used "to cry whole bucketsful of tears." So they cultivate the female capacity for small and ingenious worrying—a quality which has its analogue in the petty cruelty of boys—and endeavor to worry Miss Power from the school. The task of reforming these torments and delivering an instructive lesson through the lips of the chief sinner is very skilfully done, the interest of the story not in any way flagging, nor the human nature ceasing. The close of the book finds Miss Power loved as well as respected, while the reader will particularly like her, as she is a lady of few words, no moralizing, a discerning disciplinarian, and one who has the capacity for turning the experience of her scholars into their best teacher.

Another good book this year is 'Little Laddie.' It is for very small people, the hero being a Johnny who cannot talk plainly. There is just a trifle too much of this baby talk—"I've got somesing so nice for 'ou, 'ickle birdies," being the style which, once begun, the author feels bound to stick to consistently all through. The incidents are sprightly and interesting in spite of the extremely young public addressed, the language is simple, and the print large and fair—all recommendations to beginners in the art of reading. Johnny has an elder sister, one of those motherly little girls who make so large a part of the comfort of a poor family. May is Johnny's teacher and playmate, and her gentle spirit and sage management form the most attractive feature of the book. The religious teaching at the end is very literal and of decided orthodoxy, so that 'Little Laddie' will be more acceptable in Church than in "Liberal" circles.

'Mary Howitt's Poems of Natural History' is one of the handsomest and most covetable Christmas books for young people we have ever seen. The workmanship of the volume is in the highest style of printer's and binder's craft, while the pictures by Giacomelli are more than a mere adornment—they are exquisitely finished little works of art, quite worthy to be embellished by poems. Of Mary Howitt's writings, nothing need be said; she has long ago taken rank as one of the first writers for the young, as well as a versifier of taste and culture and high moral tone. Much of her poetry is already as "household words" here as well as in England, and there must be many people who, familiar with it in their young days, would be glad to place it in the hands of their children. Two or three of the poems here included are written by William Howitt. Five of those by Mrs. Howitt appear for the first time in this work.

'Rhoda Thornton's Girlhood' is prefaced by a pleasant little note of praise from Mr. Whittier, who had read "some chapters" in it "with great satisfaction"; so that the reader begins the story with an agreeable prepossession. Nor is he, or she—for it is more particularly a girl's book—likely to be disappointed. She may possibly be even better pleased with it than she had expected, for young folks sometimes care more for the narrative than they should, and less for the "local coloring and characterization" of which Mr. Whittier makes complimentary mention. Fortunately for this youthful taste, Mrs. Pratt has plenty of "story" to tell, and does not digress into any impertinent "sketching"—a clever accomplishment much in fashion now, but which interferes with the progress of a story, and causes disturbance in the immature mind.

In Rhoda, we have again the motherly little girl, taking care of her small brother as well as herself on a New England "poor-farm." They are orphans about whom nobody knows anything. By-and-by, Rhoda gets a "place" on a typical New England farm, where she manages to take Jimmy with her. They continue to live with Miss Deborah Nichols several years, until it is discovered in a curious way that they are related to a very rich family in the neighborhood, and are themselves heirs to wealth. This is only a rough outline of a really well-conceived, well-told tale. It reminds one, in its descriptions of New England life, of some of the chapters in Miss Wetherell's popular books. The style is simple and direct, and there is a pleasant humorousness throughout. There is, to our taste, a little too much wealth and "aristocracy" at the end; the sterling virtues of Rhoda's character, strengthened by her peculiar experiences, seem to find a niche where they have no play. Independent and generous she is shown to be through all; but generosity is a pleasant pastime when money is plenty, and independence comes as natural as breathing to "first families." Still, 'Rhoda Thornton' deserves to be well recommended. Church-going people, and those who choose a special kind of reading on Sunday, will particularly approve of it, while others will not find religious opinions unpleasantly obtruded.

'The Life of a Bear' is a nice story in big print and big pictures for small boys. The kind of story is familiar to everybody: a family of animals with human names and human feelings, and a mixture of human and animal attributes, going through a series of adventures more or less consistent with probability. It is only necessary to say of this one that it is a good specimen of its kind, and as likely to be popular with boys not too old for it as any of its predecessors. There is not much natural history to be learned from it, and perhaps not much *unnatural* history that will have to be unlearned.

Gift-Books.—It is not so easy as it once was to distinguish this class of publications from the ordinary sort, but we believe the title may properly be applied to the works we are about to enumerate. First in those qualities of paper, print, and binding which suggest the Christmas present, is Taine's 'Tour through the Pyrenees,' translated by Mr. J. Safford Fiske in what seems a skilful manner, and illustrated profusely by Doré (Henry Holt & Co.) The author's descriptive powers have seldom had a finer field, and he has not kept them in check. Scraps of history and philosophy, here a legend and there an extract from the old chroniclers, mingle with the narrative of travel, if narrative it can be called, when we have, rather, a series of photographic impressions of place after place, without much thought how the tourist got there; a disconnectedness favorable to desultory reading, and, therefore, quite in keeping with a holiday gift-book. But M. Taine is always interesting enough to be read continuously, and the present case forms no exception. The illustrations, which are largely of landscape, only now and then suggest the best-known and the least attractive side of Doré's genius; though the stories of Pé de Puyane and, after Froissart, of the Count de Foix, give scope for some touches characteristic of the satirist of 'La Sainte Russie.' The Spain described, by the way, is the Spain of twenty years ago.

Another work which bears the stamp of the season is Mrs. Eliza Greatorex's 'Summer Etchings in Colorado' (G. P. Putnam's Sons). The scene of this lady's artistic and literary labors was the vicinity of Colorado Springs, and chiefly at the sanitary settlement of Manitou (some seventy-five or eighty miles south of Denver), which enjoys an altitude about equal to that of Mt. Washington. Pike's Peak, the Ute Pass, the Garden of the Gods, and other romantic and charming resorts are close at hand, to which Mrs. Greatorex made excursions in quest of sketches and adventures, and now has made a book of the whole. We have found her chapters agreeable reading. They convey the impression of a truthful realism, much as do the etchings themselves. These, if not the highest efforts of their kind, are certainly praiseworthy, and all the more because of the neglect which this particular art suffers in our country. We judge from her own statements that Mrs. Greatorex drew first pen-and-ink sketches from nature, which were afterwards elaborated at her convenience under the graver. Their appearance confirms this view. They are generally over-elaborated, and lose the atmospheric effect which a freer handling might have ensured. In this respect they may be instructively compared with Mr. Hamerton's plates, executed entirely in the open air, in his 'Unknown River.' However, it is, as we have said, more proper to praise here than to criticise, and all these "summer etchings" are interesting.

'Art Culture' (John Wiley & Son) is, in the words of the sub-title, "a hand-book of art technicalities and criticisms, selected from the works of John Ruskin, and arranged and supplemented by Rev. W. H. Platt, for the use of schools and colleges." It is, besides, a very appropriate gift for any young person having an artistic temperament, whether or not a teacher is at hand to enforce its lessons. We need not enquire if this orderly digest of Mr. Ruskin's doctrine has been ideally well done; it is enough to praise the design, in the certainty that want of skill in arranging, or even of perfect intelligence in selecting, will detract little from the value of extracts from an author remarkable for always talking not only to the point, but to *a* point. On the other hand, it cannot but be an advantage to have Mr. Ruskin's best thoughts on composition, tone, color, perspective, sketching from nature, etc., brought together systematically as here, with a due proportion of the original illustrative designs—wood-cuts, lithographs, etc. Such a compendium is of course an excellent introduction to the further study of Ruskin, as well as of art; and for this a list of his works would have been helpful.

The plates of 'Pictures by Old Masters of the French, Dutch, and Flemish Schools' (T. Nelson & Sons) bear marks of previous usage and even of hard usage, and the imprint is without date. Mr. Dafforne's histo-

rical and critical descriptions might have redeemed these imperfections, but, in fact, they are commonplace in style and, as criticisms, of little worth. A certain number of facts and dates; some idea of the personal appearance of the artists under discussion, and of the subjects of sundry of their paintings, are all that the purchaser of this showy volume need expect.

The American edition of Mr. Edward A. Freeman's 'History of the Norman Conquest of England' (Macmillan & Co.), although reduced one-half in price as compared with the English edition, forms still, in all respects, a handsome series for the book-shelf. To the present four volumes a fifth and final volume will be added as soon as published on the other side, together with an index to the whole five. All the maps are here, and as for the text, Mr. Freeman states that he has carefully revised it, corrected such mistakes as he has found, and incorporated the additions and corrections to each volume in their proper places in text, notes, or appendix. We have mentioned no work better suited for a holiday gift, whether as regards the outward dress or the contents.

Sub-Tropical Rambles; or, The Land of the Aphanapteryx. Personal Experiences, Adventures, and Wanderings in and around the Island of Mauritius. By Nicholas Pike. (New York: Harper & Brothers. 1873. 8vo, pp. 509.)—We may premise, to save our readers the trouble of searching the maps, that Mauritius is a charming island in the Indian Ocean, lying some 300 miles east of Madagascar, and in 20 degrees south latitude. It was discovered by the Portuguese in 1505; was held by the Dutch from 1644 to 1710; then, with the neighboring island of Bourbon, belonged to the French for a century; and, lastly, for some sixty years, has been a British colony. For many years, it has been one of the great sugar-producing centres; for, though its size seems insignificant, being only 39 miles long by 34 miles wide, it has exported as much as 130,000 tons of sugar in a year. It has also for a century been of considerable importance commercially as a port of refuge for all vessels engaged in the East India trade, being midway between the Cape of Good Hope and the main Eastern ports. Of late years, too, it has been the rendezvous of whalers, the ocean in that latitude being the habitat of the sperm whale.

Although so long a British colony, very few books have been published concerning its history, and this most recent and comprehensive volume is the work of the American consul at Port Louis. As his book is especially devoted to the natural history of the island, we will first attempt a slight sketch of its political history. The French East India Company, in 1734, was the owner of the island, and in that year most fortunately chose as Governor Mahé de Labourdonnais. He introduced the sugar-cane and various grains and plants into the agriculture of Mauritius; he built arsenals, forts, quays, shops, aqueducts, and canals; he transformed the island into a colony; and yet his immense labors and successes are forgotten, while the trivial occurrence of the wreck of the *St. Géran*, transformed in the romance of 'Paul and Virginia,' will remain for centuries as the chief event connected with Mauritius. The colony was naturally supported by slave-labor, and was as naturally Royalist at the time of the Revolution in France. The decrees of the home government for the abolition of slavery were disregarded, and when Napoleon, in 1802, re-established the slave-trade, his government was cheerfully acknowledged. In 1809 and 1810, incessant sea-fights occurred between the French and English fleets, and finally an English expedition landed on the island and compelled its total surrender in October, 1810. In 1814, on the restoration of Louis XVIII., Mauritius was definitively ceded to England, and Bourbon was restored to France. The island has, however, remained French in language, laws, race, and sentiment. In 1834, slavery was abolished in all the British dominions, and Mauritius received compensation for 68,613 slaves, at a rate averaging about £70 apiece. This period we have often heard described by the older inhabitants as the "flush times" of the colony. The money paid to the slave-owners was spent in luxury; the slaves refused to work during the five years remaining of nominal apprenticeship. At the end of the time, the colony found itself without capital or laborers, and a period of corresponding depression ensued. The control, however, was in English hands, and a scheme was matured for the importation of coolie labor from India, which resulted in placing the prosperity of the island on a sure basis for a number of years.

The ill-timed leniency of England in giving the natives control of municipal affairs has been the great error to which recent misfortunes can be traced. The population is about 300,000, of which over two-thirds are Indian coolies, 60,000 are descendants of the slaves, and the rest are whites of French descent, with a very small admixture of English residents. The Indians, of course, count for nothing politically, but the city of Port Louis was given up to the control of its inhabitants, ignorant blacks and almost equally ignorant Creole whites. It had a population of 74,128 crowded within the limits of ten square miles. In 1866, '67, and '68, a local fever ravaged the island, and it was directly owing to the total lack of sanitary laws. There was not a drain in Port Louis, and the city government would not authorize the construction of any. The fever commenced in Port Louis, then spread to other parts of the island, and the deaths amounted to 12,548 in 1866, 41,100 in 1867, and 19,011 in 1868. From such a crushing blow it will take the colony years to recover. Yet with any regard to the ordinary rules of health, Mauritius must always be prosperous, and must be an important dependency of England. The climate is delightful; the country is charmingly diversified; access to other countries is sufficiently easy; nothing is wanting to render it an earthly paradise but submergence for fifteen minutes, a sufficient time to wash out its present inhabitants.

Consul Pike's book is one of great interest to the naturalist, as his rambles were chiefly made in the pursuit of plants and shells. He has set an admirable example to those of our fellow-citizens who have been rewarded for political services by honorary exile. We wonder while reading his pages at the chance which gave our Government such a representative. If, indeed, in this review we have seemed to have little to say about Mr. Pike, we shall plead that we have followed his example. This group of islands has been famous for a race of wingless birds, of which the extinct dodo is the type. Mr. Pike calls Mauritius the land of the Aphanapteryx, from another species of bird, but in his preface he says, "A full description of this bird will be given in a future volume," and so omits any further reference to it. When that volume appears, we will devote ourselves exclusively to Consul Pike and the aphanapteryx.

Love's Meinie: Lectures on Greek and English Birds, given before the University of Oxford. By John Ruskin, LL.D., etc., etc. (New York: John Wiley & Son. 1873.)—Extraordinary contempt for accuracy, as well as for the usual methods of attaining it, is a striking feature of this treatise. Perhaps a majority of the statements of fact are simply incorrect, while the inaccuracy of many others shows offensively in connection with a sneer at the means by which such glaring errors might have been avoided; and again, some of the erroneous statements are an uncalled-for attack upon a large and powerful class of thinkers—we mean scientists. Mr. Ruskin remarks, without qualifying context: "No English gentleman in recent times has ever thought of birds except as flying targets or flavorous dishes. The only piece of natural history worth the name in the English language, that I know of, is in the few lines of Milton on the Creation" (p. 7); and holds the literature of his subject up to ridicule in a manner that mainly serves to display his ignorance of it. In fact, he unintentionally avows this ignorance: saying that he "has looked wholly in vain through all his books to find some account of the muscles a bird uses in hopping" (p. 25); the fact being that these muscles have been often described in elaborate detail, and their peculiarities made the basis of one of the fundamental divisions of recent birds in a now generally received classification. He speaks of "the vile industries and vicious curiosities of modern science" (p. 51) with the singularly pointless accusation that they, "while they have robbed the fields of England of a thousand living creatures, have not created in them one." His count against the theory of evolution is couched as follows (p. 27):

> "Nay, we might even sufficiently represent the general manner of conclusion in the Darwinian system by the statement that if you fasten a hair-brush to a mill-wheel, with the handle forward, so as to develop itself into a neck by moving always in the same direction, and within continual hearing of a steam-whistle, after a certain number of revolutions the hair-brush will fall in love with the whistle; they will marry, lay an egg, and the produce will be a nightingale."

This is neither wise nor witty. But as much cannot be said of the description of a swallow (p. 53): "It is an owl that has been trained by the Graces. It is a bat that loves the morning light. It is the aerial reflection of a dolphin. It is the tender domestication of a trout." Coming from an unknown pen, this would have been dismissed as bosh; and we doubt if there are many, even among the admirers of Mr. Ruskin, who can honestly say they see the point of it. It is unfortunate that a great artist's idiosyncrasies should have led him into such extravagances—most of all, that they should have committed him to the mistake of treating of matters his unfamiliarity with which is evident (we mean the scientific, as distinguished from the artistic, aspects of his subject) with manifest confidence in his ability to treat them well. It was, for example, unwise for him to castigate the authors of certain theories of the flight of birds before propounding one of his own—entirely such a one as was to have been anticipated.

Nor are we, viewing Mr. Ruskin merely as an artist, prepared to change the tenor of our criticism. Surely we had reason to expect that his stand

here would be firm, despite his slips as an amateur ornithologist. He remarks (p. 70), showing a Holbein: "It is entirely disgraceful he should not know what a wing was better— I don't mean it is disgraceful he should not know the anatomy of it, but that he should never have looked at it to see how the feathers lie"; and presents (p. 67) a drawing of his own which shows, as parts of a single figure, half the upper surface of a right wing joined with the other half of the under surface of a left wing, just for want of seeing "how the feathers lie" himself.

Admiration of Mr. Ruskin, or the reverse, is necessarily a matter of individual taste, since he refuses, with what we may call wilfulness, to be rated by any standard susceptible of general appreciation. But it is improbable that many of his admirers even will believe that this treatise will either add to his reputation as an artist or give him any claim to the title of naturalist. The subjects of his lectures, by the way, are no more "Greek and English" than they are French, German, or Italian birds.

BOOKS OF THE WEEK.

Authors.—Titles.	*Publishers.—Prices.*
Atkinson (J. B.), An Art Tour to Northern Capitals in Europe	(Macmillan & Co.) $3 00

Black, M.A.; and an Account of his More Important Paintings and Drawings. Illustrated with Permanent Photographs and Wood Engravings. Royal 8vo, cloth, gilt, $12.

Uniform with the above.

RAPHAEL OF URBINO AND HIS FATHER, GIOVANNI Santi. By J. D. Passavant, formerly Director of the Museum at Frankfort. Illustrated by Twenty Permanent Photographs. Royal 8vo, cloth, gilt, $12.

LIFE AND HABITS OF WILD ANIMALS. A Series of Illustrations drawn by Joseph Wolf and Engraved on Wood by the Messrs. Whymper. With Descriptive Letterpress by D. G. Elliot. Imperial 4to, cloth gilt, $10 50.

[*Next week.*

HOLIDAY BOOKS OF PERMANENT VALUE.

Published this day,

I.

THE TROPICAL WORLD. By Dr. G. Hartwig.

II.

THE SEA AND ITS LIVING WONDERS. By Dr. G. Hartwig.

Each in one volume octavo, with 300 beautiful illustrations, including 8 colored plates. Handsomely bound in cloth extra, with gilt tops.

Price, per volume, $6.

DODD & MEAD, Publishers,

762 and 764 Broadway, N. Y.

Will be Published December 10 by

HURD & HOUGHTON, New York,

THE RIVERSIDE PRESS, Cambridge,

I.

THE GRAMMAR OF PAINTING and Engraving. From the French of Charles Blanc. By Kate Newell Doggett. In one 4to volume, elegantly illustrated with the original illustrations. Price $6 50; gilt, $7.

☞ A notable book, giving the general reader an intelligent account of how an artist works in producing his effects It is a book of principles, illustrated by accounts of particular pictures.

II.

PAINTERS, SCULPTORS, ARCHITECTS, Engravers, and their Works. A Handbook. By Clara Erskine Clement. In one volume crown 8vo, profusely Illustrated, $3 25.

☞ A book that will be indispensable to every person interested in pictures and artists. It gives not only the biography of artists, but lists of engravings from their works, and, by means of its cross-references and copious indexes, is a complete handbook.

Also, always on hand,

A HANDBOOK OF LEGENDARY and Mythological Art. By Clara Erskine Clement. Profusely Illustrated. In one vol. crown 8vo, cloth, $3 25. (Fourth Edition.)

'All that we need to explain the stories illustrated or the persons represented in the pictures and statues of the churches and galleries of Europe may be found in Mrs. Clement's book, which ought to be known to a large public."—*Eugene Benson, in the College Courant.*

III.

SEVEN HISTORIC AGES; or, Talks about Kings, Queens, and Barbarians. By Arthur Gilman, author of 'First Steps in English Literature.' In one vol. 16mo, illustrated, cloth, $1.

☞ A chatty little book on history, giving children, in a familiar way, a notion about the course of history. Every one who has seen Mr. Gilman's admirable book on literature will want this sensible one.

HAVE READY

In 2 vols. medium 8vo, cloth, elegant, price $12.

HOLLAND HOUSE. By Princess Marie Lichtenstein. With five Steel Engravings by C. H. Jeens after Paintings by Watts and other celebrated artists, and numerous Illustrations drawn by Professor Delamotte, and engraved on wood by J. D. Cooper, W. Palmer, and Jewett & Co.

"It would take up more room than we can spare to enumerate all the interesting suggestions and notes which are to be found in these volumes. There is a correspondence between Moore and the third Lord Holland about the memoirs of Byron which is full of incident; there are one or two delightful notes from Samuel Rogers to Lord and Lady Holland, his faithful friends; there is a sketch of the life and society and intimacy of their house, which includes almost every well-known name of this century, as previous pages include more picturesque but scarcely more vivid personalities. The woodcuts are admirable, and some of the autographs are very interesting."—*Pall Mall Gazette.*

"Thanks to the work before us, with its graphic delineations and descriptions, if 'Holland House' were to be burnt down or swallowed up to-morrow, its most inspiring, elevating associations would survive, and everything in or about it capable of material reproduction might be reproduced."—*The Quarterly Review.*

Mr. E. A. Freeman's New Book.

COMPARATIVE POLITICS. Lectures delivered at the Royal Institution, by E. A. Freeman, M.A., Hon. D.C.L. Oxon. 1 vol. 8vo, cloth, price $3.

ST. NICHOLAS AND OUR YOUNG FOLKS.

The publishers of 'St. Nicholas,' Scribner's Illustrated Magazine for Girls and Boys, take pleasure in announcing that by an arrangement with Messrs. J. R. Osgood & Co., their popular Magazine, 'Our Young Folks,' has been merged in 'St. Nicholas.'

In addition to the striking novelties and great literary and artistic attractions already offered by 'St. Nicholas,' the best features of 'Our Young Folks' will be retained. 'St. Nicholas' has been enlarged, new contributions have been secured; among them, a Serial Story by J. T. Trowbridge, late editor of 'Our Young Folks,' which begins in the present number. Other eminent writers well known to the readers of 'Our Young Folks' have been engaged. We are thus enabled to present to the public a Magazine for Children and Youth superior in every respect to any ever before published.

Three splendid Serial Stories,

"WHAT MIGHT HAVE BEEN EXPECTED,"

A Story for Boys, by Frank R. Stockton.

"NIMPO'S TROUBLES,"

A Story for Girls, by Olive Thorne (Mrs. Harriet M. Miller).

"FAST FRIENDS,"

By J. T. Trowbridge.

All these Stories will be splendidly illustrated.

There will also be shorter stories, papers on Science and History, Natural History, Wild Sports and Adventures, Sketches of Travel, Fairy Tales, Poems, Puzzles, Charades, Jingles, Fun and Fancy, Instruction, Entertainment, and Delight. Something for all, from Father and Mother to the Baby. The illustrations will be the best that the Artists of two continents can supply, and will be printed with the greatest care.

FOR VERY LITTLE FOLKS.

Our pages in big type and easy words for the youngest readers, which have been "a hit" from the first, will be continued. The children will be glad to know, also, that the department of

JACK-IN-THE-PULPIT

is to be a permanent feature of the magazine. Jack will tell some of the most curious things ever heard, and make himself generally entertaining.

We have undertaken to make the best magazine possible for the little folks, as well as those who are older. Every number of 'St. Nicholas' will contain good reading matter for boys and girls of all ages, besides a great deal of hearty and innocent fun.

Christmas comes but once a year, but 'St. Nicholas,' the new magazine for girls and boys, comes every month. It has already won the hearts of the young folks, and the Little Children are crying for 'St. Nicholas.'

We want 100,000 Children and Youth made Happy by 'St. Nicholas' at the Holidays.

'St. Nicholas,' as enlarged, contains one-third more matter than 'Our Young Folks,' thus giving a great variety for all. With its great Literary and Pictorial Attractions, and its beautiful printing, it will be found to be the Cheapest Magazine in the World.

Subscription price, $3 a year. The two back numbers for November and December, '73, will be sent to all subscribers for '74 without additional charge. Four months for One Dollar.

SCRIBNER & CO.,

654 Broadway, New York.

American travellers going to or returning from the Continent of Europe, by taking this line, avoid both transit by English railway and the discomforts of crossing the Channel, besides saving time, trouble, and expense.

GEO. MACKENZIE, Agent, 58 Broadway.

THE WEEK IN TRADE AND FINANCE.

DECEMBER 8.

THE Bank of England minimum rate of discount was again reduced at the regular meeting of the directors on Thursday, and now stands at 5 per cent., against 6 per cent., to which it had been reduced from 8 per cent. the previous week. The banks of this city have been able to report handsome gains in legal tenders, while the loan certificates show a further reduction since the last report, and now stand at $12,000,000. The weekly statement of the Clearing-House banks, published on Saturday, shows that the banks hold in legal tenders and specie $52,052,800, against $209,329,500 liabilities, composed of circulation and deposits; the excess in reserve held by the banks over the amount required by law is, according to the statement, which is made up of averages, published below, $6,720,425. The actual amount of legal tenders on hand on Saturday morning was $41,155,000—about $7,000,000 more than the banks held at the commencement of the panic.

The following is a comparison of the averages for the past two weeks:

	Nov. 29.	Dec. 6.	Differences.
Loans	$247,922,300	$252,014,100	Inc...$4,091,800
Specie	19,968,700	21,320,300	Inc.... 1,351,600
Legal tenders	35,399,800	37,732,500	Inc... 2,332,700
Deposits	174,467,200	182,143,100	Inc... 7,675 900
Circulation	27,238,800	27,186,400	Dec... 52,400

Money has continued easy throughout the week to parties in good standing at 7 per cent. and under, while mercantile paper has passed more freely at 9 to 12 per cent. for prime names, and at 15 to 18 per cent. for names less favorably known.

The $44,000,000 "legal-tender reserve" had been drawn upon up to Saturday to the extent of $13,000,000—the outstanding amount was then stated to be $369,000,000, against $356,000,000, the amount authorized by law.

The stock market has been very active, and a regular "bull" campaign seemed to have been inaugurated upon the opening of business on Monday, ever since which time a gradual advance in the prices of speculative stocks has taken place. The market has been healthy in tone, and seemed to be influenced by legitimate causes, such as the increasing abundance of money; the strong probability that more currency will be added to the amount already in circulation, at least to the extent of legalizing by Congress the reissue of the $44,000,000 legal tenders retired during Mr. McCulloch's administration of the Treasury Department; and the important fact that the greater number of the stocks dealt in at the Stock Exchange have been, and many of them are now, selling below their real values. On Saturday, the probability that the Grinnell estate would be settled up and released from the control of the Bankrupt Court imparted a very buoyant feeling to the market, and when it was announced this morning that Judge Blatchford had signed the order so releasing it, the rush to buy was nearly as great as it was to sell during the recent panic. The amount involved in the failure of Grinnell & Co. was about $13,000,000, and nearly a corresponding amount of stocks had been privately sold out by the creditors during the last week, so that this large block no longer hangs like a cloud over the market. The advance to-day carried Central and Hudson to 95½, Lake Shore to 76½, Rock Island to 97⅛, Wabash to 53⅝, Western Union to 74½, Northwestern Common to 54½, Saint Paul common to 40¾, etc. The investment stocks shared in the advance, New Jersey Central going to 98, Delaware, Lackawanna, and Western to par, and Harlem to 121.

The following shows the highest and lowest sales of the leading stocks at the Stock Exchange for the week ending Saturday, December 6, 1873:

	Monday.		Tuesday.		Wed'day.		Thursday		Friday.		Saturday		Sales.
N. Y. C. & H. R.	90⅞	91⅜	91⅜	92⅜	92	93⅛	92½	93¼	92	93⅛	92⅜	93½	56,300
Lake Shore	70⅜	73⅜	72	73½	72⅛	73½	71½	72⅝	71⅝	73	72⅝	73⅜	111,200
Erie	46¼	47	45⅞	46⅜	46⅛	47⅜	45¾	46⅜	45	....	....	....	10,800

The Government bond market has been very strong since the publication of the President's message. Prices have advanced nearly 2 per cent. on the more active issues of the 5-20's, such as July 65's, 67's, and 68's. The demand for bonds has come mostly from home investors, but great difficulty is experienced in filling orders, owing to the scarcity of supply. 67's closed on Saturday at 116¾, and July 65's at 116, against 114⅞ and 114 respectively, the closing prices of the week before.

The gold market has remained quiet, and the fluctuations by no means wide, considering the Cuban news at times being quite warlike, and the danger of Congress passing some law tending to inflate the currency. The range of quotation has been between 108⅛ and 109½, closing at 109½ on Saturday.

"Best Periodical in America."—*Rev. Dr. Cuyler.*

Prof. Max Müller, Prof. Tyndall, Prof. Huxley, Lord Lytton, Fritz Reuter, Mrs. Oliphant, Dr. W. B. Carpenter, C. Kingsley, Erckmann-Chatrian, Ivan Turguenieff, Matthew Arnold, W. E. H. Lecky, Miss Thackeray, Miss Muloch, Prof. Richard A. Proctor, Katharine C. Macquoid, Jean Ingelow, Geo. MacDonald, Froude, and Gladstone are some of the eminent authors lately represented in the pages of

Littell's Living Age.

A weekly magazine of sixty-four pages, *The Living Age* gives more than

THREE AND A QUARTER THOUSAND

double-column octavo pages of reading-matter yearly, forming four large volumes. It presents in an inexpensive form, considering its great amount of matter, with freshness, owing to its weekly issue, and with a satisfactory completeness attempted by no other publication, the best Essays, Reviews, Criticisms, Tales, Poetry, Scientific, Biographical, Historical, and Political Information, from the entire body of Foreign Periodical Literature.

A NEW SERIES

was begun Jan. 1, 1873, with entirely new Tales, already embracing Serial and Short Stories by distinguished English, French, German, and Russian authors, viz., Lord Lytton (Bulwer), Erckmann-Chatrian, Ivan Turguenieff, Miss Thackeray, Mrs. Oliphant, Fritz Reuter, Mrs. Parr (author of 'Dorothy Fox'), Julia Kavanagh, etc.

During the coming year, as heretofore, the choicest serial and short stories by the Leading Foreign Authors will be given, together with an amount, unapproached by any other periodical in the world, of the best literary and scientific matter of the day, from the pens of the above-named and other foremost Essayists, Scientists, Critics, Discoverers, and Editors, representing every department of knowledge and progress.

The importance of *The Living Age* to every American reader, as the only complete as well as fresh compilation of a generally inaccessible but indispensable current literature—indispensable because it embraces the productions of the Ablest Living Writers in all branches of Literature, Science, Art, and Politics—is sufficiently indicated by the following Opinions:

"Reproduces the best thoughts of the best minds of the civilized world upon all topics of living interest."—*Philadelphia Inquirer.*

"In no other single publication can there be found so much of sterling literary excellence."—*N. Y. Evening Post.*

"The best of all our eclectic publications."—*The Nation, New York.*

"And the cheapest. A monthly that comes every week."—*The Advance, Chicago.*

"The ablest essays, the most entertaining stories, the finest poetry of the English language, are here gathered together."—*Illinois State Journal.*

"With it alone a reader may fairly keep up with all that is important in the literature, history, politics, and science of the day."—*The Methodist, New York.*

"A pure and perpetual reservoir and fountain of entertainment and instruction."—*Hon. Robert C. Winthrop.*

"In view of all the competitors in the field, I should certainly choose *The Living Age*."—*Rev. Henry Ward Beecher.*

"Has no equal in any country."—*Phila. Press.*

"Indispensable to every one who desires a thorough compendium of all that is admirable and noteworthy in the literary world."—*Boston Post.*

The Living Age is sent a year (52 numbers), post-paid, on receipt of $8; or, six copies for $40.

☞ *EXTRA OFFERS FOR 1874.*

To new subscribers now remitting $8 for the year 1874, the last six numbers of 1873 will be sent *gratis;* or, to those wishing to begin with the NEW SERIES, the numbers of 1873 and 1874 (104 numbers) will be sent for $13; or, to those preferring, the publishers make the following *Club Prices for the best Home and Foreign Literature:*

["Possessed of *The Living Age* and one or other of our vivacious American monthlies, a subscriber will find himself in command of the whole situation."—*Philadelphia Bulletin.*]

For $10, any one of the American $4 Monthlies (or *Harper's Weekly* or *Bazar*, or *Appleton's Journal*, weekly) is sent with *The Living Age* for a year; or, for $9, *The Living Age* and Scribner's *St. Nicholas.* Address

NEW YORK, THURSDAY, DECEMBER 18, 1873.

The Week.

THE agreement between Mr. Fish and Admiral Polo has been fully confirmed by the Madrid Government, and by the time this reaches our readers the *Virginius* and the surviving prisoners will have been delivered to an American man-of-war. The Volunteers in Havana were at first a little obstreperous on hearing the news, but on learning that, if they went to war, they would have to fight the United States single-handed, they judiciously cooled down. One riotous demonstration was made in front of the Captain-General's palace, but it was readily suppressed, and indeed that functionary is showing himself unusually courageous. The "excitement" has accordingly died out here also. A feeble attempt to revive it in the interest of the Cuban insurgents was made on Monday by a sympathy meeting at which the Reverend Mr. Hepworth was the principal speaker. He, and another Reverend over in Brooklyn, named Talmage, have for a week or two been rampant for war, and showed evident signs of a determination not to be taken alive. They both wanted to liberate Cuba by reading in their "study" accounts of slaughter in the morning papers, and then praying and preaching over it to their "flocks." This mode of fighting Spain they doubtless feel they could stand as long as anybody. It is, in fact, pleasant to improve an occasion with other people's wounds, and pray for the chastisement of the enemy when other men have to stand his fire and storm his works. Mr. Hepworth, at the meeting in question, expressed a strong wish that our message might be sent to Spain in a "bombshell," and then went on to utter a libel for which he ought, if the law was what it should be, to receive thirty days in the county jail, together with a first experience of useful industry, by alleging that Mr. Fish and his son-in-law took bribes from the Spanish Government.

Very little has been heard during the past week of the whereabouts of the owner of the *Virginius*, Mr. Patterson. It will be remembered that it was the ownership by Mr. Patterson which gave the vessel her American character, her right to carry American papers and to fly the flag of the Union; gave our Government the right to demand her back from Spain, and to threaten to prepare for a bloody though glorious war. It was indubitably due to Mr. Patterson that we shouted aloud through our newspapers, and through our mass-meetings, and through our pulpits that the *Virginius* must be given up; and, indeed, if there had been no Patterson, she never would have been given up at all. Yet it is now said that Mr. Patterson will make no claim upon the vessel—by some persons—because he is afraid if he does he will be proceeded against under the neutrality laws. But if he does not, others say, own her, who does? If she is owned in Venezuela or Chili, it is the Venezuelan or Chilian Government which has a case against Spain. If she is owned by the Cubans, she will have to be sent back, after which international law would probably require the sinking of a coal-barge between her and the open sea. Meantime, there are urgent enquiries for Patterson throughout the country, and what the people desire to know is whether he takes no interest in his property, what is his address, why he is not heard from, why he does not "come to the front"?

We presume most people are a good deal humiliated by the financial situation at Washington. We mean nothing particularly disrespectful when we say that the finances of a great commercial country have not, since the practice of publishing Government accounts began, been in such inexperienced hands as those of the President and Mr. Richardson. The Treasury is nearly empty, in spite of the $44,000,000 of "reserve," and the Secretary and the Committee of Ways and Means are at loggerheads about the best means of replenishing it. Mr. Richardson has given "his reasons in writing" for desiring an increase of taxation, which are: that there has been during the last two months and a half a falling-off in the receipts from customs, which is likely to last for some time longer; that the public debt has increased $9,000,000 during the month of November, and that it will be increased "many millions" during the present month; that the $18,000,000 of "what has been called the reserve" has been issued, and consumed by the current expenses of the Government; that, therefore, there ought to be increased taxation, and that tea and coffee, spirits, gas, railroad and steamboat receipts, and express, insurance, and telegraph companies are the best subjects for it, inasmuch as they can be reached with the least amount of interference with the general business of the country.

We greatly admire the calm with which Mr. Richardson speaks of the $44,000,000 as "what has been called the reserve," inasmuch as we believe that name was given to it for the first time either by himself or by his chief, Mr. Boutwell. They began calling it a "reserve," instead of a bundle of cancelled notes, as soon as they took it into their heads to issue it to "move the crops." Their right to issue it was doubted by everybody but themselves; but they paid no attention to any doubts. Now, however, when nearly half of it is out, Mr. Richardson asks Congress to define his power with regard to it. He should have got Congress to do this before he touched it. No man should think of issuing irredeemable paper money, and thus altering the price of people's property, without express and unmistakable authorization. We must say one thing more. A political financier ought to know by this time that a panic causes a fall of prices, and therefore stops imports and stimulates exports, and that as long as its effects are felt there is sure to be a diminution of revenues derived from customs duties. Therefore he should, when the symptoms of a panic show themselves, either begin to lay up money to meet the deficiency, or stop the panic resolutely at the outset by Government aid. In other words, he ought to understand the law of foreign exchange and have a policy of some kind.

The Committee of Ways and Means, on the other hand, are very unwilling to increase taxation, as if they do so it will naturally bring the Republican party into discredit. They have therefore reported to the House a resolution, in which the Committee on Appropriations has concurred, requesting the President and heads of departments to revise the estimates with a view to their reduction, so that every resource in the direction of economy may be exhausted before any measure of increased taxation is entered on. This led to a debate, in which Ben Butler, called euphemistically by Mr. Dawes his "distinguished colleague" and his "weighty colleague," expressed a strong dislike to taxation, and a desire for the issue of more non-interest-bearing promissory notes to meet the deficit, and great indifference as to what the "Jew bankers of Europe think about our credit," and called the proposal to cut down the expenditures "a picayune business." Mr. Dawes declined to "antagonize" with his "distinguished colleague," and was followed by Mr. Kelley of Pennsylvania, who produced a plan of filling the Treasury by the issue of new bonds bearing a low rate of interest and redeemable in United States notes; but a discussion of it was prevented by adjournment. The "3-65" plan is still in the field. There are two or three plans for a return to specie payments, one brought forward by Mr. Sumner, based on the redemption-by-instalment principle. Mr. Pratt, a member of the House from Indiana, whose bumps ought to be carefully examined, desires to have enough greenbacks issued to keep the rate of interest down.

The debate on the salary grab has ended, for the time being, in the passage of a bill repealing the Salary Act, and making the repeal take effect from March last. The debate has been rather remarkable as having developed a determination on the part

of the members not to sacrifice their salaries to morality altogether, as they seemed at first inclined to do; and it has also opened a fine field for speeches, taking the form of biographical and autobiographical narration. Judge Lawrence of Ohio distinguished himself in this debate by making a vigorous speech denouncing all salary acts of any kind as iniquitous; the three great crimes of the age, he said, were the Missouri Compromise, the firing on Fort Sumter, and the Salary Act. His speech was pitched in a war-key and offended his hearers, who showed in reply that the judge, in 1866, had advocated the back-pay act of that year, had received $4,000 back-pay under it, and also had maintained that it would be unconstitutional not to take it. At one point the continuance of the debate was objected to by a member, on the ground that the Constitution forbade cruel and unusual punishments, and at another a parliamentary proceeding was resorted to which, we believe, is not laid down in any of the books—that of exhibiting a picture of a ram bearing the name of the objectionable member. The Judiciary Committee under Butler has reported and carried a bill repealing the Bankruptcy Act altogether, though the Committee was defeated on some of the minor details of the measure; and the House has passed a bill granting universal amnesty to the two or three hundred persons who have not been amnestied already.

Washington is a place in which new customs spring up quickly. The newspapers have been for a long time in the habit of taking judicial cognizance of the practice prevalent among members of Congress of making long and elaborate speeches on finance, taxation, foreign relations, or anything else—not with the old-fashioned design of influencing their hearers, but for the purpose of sending these same speeches through the mails to their constituents, thus impressing them with a sense of their Representative's importance. The abolition of the franking privilege must, however, have taken from this time-honored custom a great deal of its pleasure, and, whether for this or some other reason, another device seems to be coming more and more into vogue. A member who wishes to influence the minds of his constituents now finds that it is not necessary to make real speeches about real bills. All that is necessary for him to do is to give evidence of activity, and this he can accomplish by the introduction as well as by the discussion of measures. Eight hundred and fifty bills have been introduced already in the House of Representatives, and we are glad to say that, according to a Washington correspondent who seems to be well informed, nine-tenths of these bills are brought in for the simple purpose of being printed with the member's name in full, and marked copies of the official paper containing the record sent home. Of course, the simple-minded, rural constituents see with amazement that their Representative, whom they always took for a plain sort of man, has developed, now that he has got to Washington, ideas of the most comprehensive kind on almost all the subjects within the range of legislation, and they are naturally proud of him. The transmission through the mails ought to cost very little, because an active member can get a dozen or two dozen bills in on one day, and they are probably printed in small compass, merely by the title.

Gen. O. O. Howard, of the Freedmen's Bureau, has been for some time laboring under charges of a very grave nature. There has hardly been a time since the close of the war when there has not been some scandal attaching to his name, either relating to the Bureau or Howard University; and now the Secretary of War says in a message to the Speaker of the House of Representatives, that an examination into the records of the Bureau carried on in the War Department (to which the Bureau was not long ago turned over), reveals a strange disappearance of papers and money of which no account can be found. The Secretary says that the late Commissioner, General Howard, was at once informed "of the absence of important records," and "of the apparent exhibits against him," with a view to his "offering explanations and supplying the missing records." With regard to "one item, stated at $121,000, not accounted for," he says: "It will be seen that the accounts cannot be produced, and no attempt has been made to prove what has become of the money. Accounts covering the amount in part are now alleged to have existed, but the disbursing officer, George W. Balloch, has stated that, as they were not considered of much importance, they were not kept in the cases with the other accounts." The Secretary has deemed it best to "submit the entire subject to the House of Representatives."

A cheap-transportation caucus of Southern and Western Congressmen was held in the hall of the House of Representatives on Saturday evening. Fifty or sixty Representatives and one or two Senators were present, but the meeting was a failure. What with the Fort St. Philip Canal, and the James River and Kanawha Canal, the St. Lawrence route, and the Atlantic and Great Western Canal, and the Galveston Harbor Improvement scheme, and some dozen more, it was found that nothing could be done by the caucus except pass a resolution in favor of "unity of action"—a very difficult kind of unity to attain without unity of intention. Meanwhile, there is, among others, the Fox River plan; and the President wants the country between the Missouri River and the Rocky Mountains improved by irrigation. A Colorado correspondent of the *Tribune* very conclusively shows that this is nonsense, because, in the first place, there is not enough water to do it with; in the second place, it would saddle the Territory with a very large debt; in the third place, the farmers, in convention, after a long discussion in which both sides were patiently heard, voted almost unanimously against the scheme; and, in the fourth place, it would drain and turn into a desert a very large tract of cultivated country. Besides these difficulties, Messrs. Dawes and Garfield have sent word to all the departments that estimates must be cut down, so that altogether the horizon of the cheap transporter, the canal-deepener, and the irrigationist is black indeed.

The Illinois State Grange has held a meeting at Chicago, and resolved that what it seeks is the elevation of the farmers, morally, socially, and intellectually, by just and equitable means; that it is gratified at the growth and prosperity of the order, but regards its "educational influence in inculcating the rights and duties of citizenship" as its most valuable and durable work; offers fraternal co-operation to all organizations of similar character engaged in advancing the good cause; deplores the rapid destruction of forests, and insists that any laws tending to produce this result should be modified or repealed; declares that the laws relating to banking and the currency should be so modified as to favor "a general distribution of the money supply," to break up "banking monopoly," and to check the "immense concentration of capital for speculative purposes"; favors some permanent financial policy looking to a return to a specie basis; denounces the Salary Act, and earnestly requests its repeal; declares that the opprobrium sought to be cast upon the farmers' movement, as being responsible for the panic, is a compliment to that class, which has perhaps done something to expose fraud and corruption; declares that Congress has control over inter-State commerce, and ought to exercise it; that the "prohibitory restrictions laid upon foreign vessels which would otherwise engage in the transportation of Western products between different parts of the United States, are a tax upon Western industry, and ought to be repealed"; that the present "transportation facilities" are entirely inadequate, and that the country requires more canals, more railroads, liberal charters, under certain circumstances Government aid, and in the last resort a Government freight-railroad; that the "right to control chartered monopolies" is an inalienable right in the people; that the Illinois Railroad Law ought to be tried and not repealed; that the civil service is a "school of political corruption," and that our statesmen ought to study its evils and discover some remedy.

These resolutions were much more moderate in tone than those which filled the newspapers two or three months ago. In Iowa, too, the Grange has held a meeting, and its proceedings show a much

more agricultural, if not quieter, state of mind among the Grangers. What they did in Iowa, among other things, was to denounce the Illinois manufacturers of agricultural implements and discountenance the purchase of their tools, and to listen to the report of a committee, which informed the Grangers that education was the most important thing for them, and recommended that, "as no steps have yet been taken by the order of the Patrons of Husbandry to educate its members in those branches which especially relate to agriculture or horticulture, we should immediately take such steps as may seem best to secure such a modification of our school laws as will introduce into our rural districts such branches. That the farmer needs more education for the intelligent performance of his duties than is required in any other calling is no less true than the painful fact that his acquirements average less."

We have had a workingman's meeting in New York during the week, at which some very stern measures were proposed as a remedy for existing social and financial troubles. The resolutions laid it down that every man who was a law-abiding citizen, and paid taxes when he was able, was in hard times entitled to support from the Government, and that this claim was strengthened in the present case by the fact that the Government had "sanctioned speculation by a few individuals" without the consent of the people; and that the meeting would therefore supply themselves and their families with the necessaries of life; and send the bills to the city treasury. Their plan for the prevention of panics was to fix a maximum of wealth which no individual should be permitted to exceed—we presume, without special popular consent. No mention was made of the amount of this limit, but we presume that fixed by one great economist of this school, Mr. Wendell Phillips—$300,000—would not be unacceptable. Whether this would prevent panics is somewhat doubtful, however. It might do so eventually, for there are no financial panics in Africa or Central Asia; but not until one big panic at the outset was fairly over. In like manner, the peace men in Europe want peace after one great war, in which the wicked would be chastised and justice done on all sides. A "Committee of Safety" was appointed to carry these resolutions out. Whether the bills are coming into the city treasury we are unable to say. We ought to add that there is more excuse for this sort of talk than appears on the surface. The relations of the city government, in all its works, to the laboring population are thoroughly communistic. We venture to assert that there is not a single piece of work carried on by the city to-day in which laborers are selected on ordinary business principles, or paid market rates, or retained for efficiency, or discharged for incompetency. A great many people flatter themselves that this was a Ring abuse, but that under the "Reform" government there is a better state of things. We affirm, on the contrary, that the state of things is exactly the same, except that other people's dependents and protégés are employed instead of Tweed's.

The week has been marked by the deaths of two men of unusual eminence, Professor Agassiz and Judge Nelson. Of Agassiz we have spoken elsewhere. Judge Nelson was less known outside professional circles, and he had already retired from the bench, and his work was done, so that his death cannot be spoken of as a loss, as Agassiz's may be. He ascended the bench fifty years ago, and only left it last year—a long service in the judiciary of this State being succeeded by a still longer one in that of the United States. He was a member of the Supreme Court from 1845 until his death, and from 1860 was a trusted adviser of the Government on difficult questions of international law. His last conspicuous service was rendered as a member of the Joint High Commission which made the Treaty of Washington and closed the *Alabama* case. But his whole judicial career was, in the highest and best sense of the word, distinguished. He belonged to the class of judges bred by the old system of tenure during good behavior; he had its tone, its independence, its courage and integrity, and if the wealth of a country be in its morals, and conduct be a large part of life, he did more for the United States than many dozens of "self-made" operators and financiers. For half a century he administered without sale, denial, or delay, justice at which no man cavilled, and presented by his life an example out of which American boys could get a great deal more than common-schools afford. We wish it could be said that our present mode of filling vacancies on the bench promised to keep up the ideal of the judicial character which Judge Nelson did so much, if not to create, to maintain.

Full details of the loss of the *Ville du Havre* have been received in the letters from the survivors, which completely exonerate the officers from all blame as regards their conduct after the disaster. In the awful ten minutes which followed the collision, there was apparently no time or occasion for discipline. Nothing could have been done that was not done. But we are just as much in the dark as ever regarding the cause of the collision, and probably shall never receive much light about it, as the officer in charge of the deck has been lost. It appears plain, however, that the ship was seen from the steamer a quarter of an hour before she struck. In short, the accident seems to be one of those appalling ones for which the only precaution of much value is a good provision of life-preservers and rafts, to which too little attention is paid. There is a good deal of talk about life-boats and methods of lowering boats, but the fact is that no steamer accident ever occurs at sea in which the ship's boats save even a large proportion of the passengers. Those who are lost are lost for want of some simple means of keeping afloat in the water until assistance can come, and this a good life-preserver or raft would supply. The boats are apt to capsize, or be smashed in the lowering, or be overcrowded, and, in the meantime, people perish by the score for want of some small support in the water. The life-preserver at present in use is rarely found by the passenger; when found, he does not know how to use it; and those who have tried it say that it has an unpleasant tendency to turn you head downwards, which makes it practically worthless.

Marshal Bazaine has been found guilty of capitulating without doing all that honor and duty required, and condemned to degradation from his military rank and from the Legion of Honor, and to death. The court-martial unanimously recommended him to mercy, and Marshal MacMahon has commuted the sentence to twenty years' seclusion and confinement in a small island off Cannes, and exempts him from the formal deprivation of his insignia and decorations. The verdict has been variously received; the Republicans approve of it, because it explains Gambetta's failure in the war, and the Legitimists because it condemns Bonapartism and helps to redeem the national military honor. There is a general disposition on this side of the water to pity the Marshal, mainly, we think, because he has been condemned by a monarchist tribunal. He himself evidently relies on some new turn in the political wheel to rehabilitate him, and the wheel turns so fast that death is the only punishment for political offences which now possesses any terror in France. It will probably serve as a useful lesson, however, and must make the Lebœufs and De Faillys shake in their boots.

The treaty made by General Kaufmann with the Khan of Khiva has been published, and it is certainly as complete an act of submission as a vanquished enemy has ever signed. The Khan acknowledges himself to be the Emperor's slave, and binds himself to enter into no direct relations with any other prince or potentate, and cedes to him all Khivan territory on the right bank of the Amu; concedes the free navigation of the river to Russian ships, and agrees to ask a Russian license for his own; gives the Russians liberty to construct as many piers and harbors as they please on the left bank, and to allow Russian colonists to settle around them; to open all the Khivan towns and villages to Russian trade; to allow Russian subjects to hold land in the khanate; to allow no persons to enter it from Russia without Russian passports; and to pay an indemnity to the Russian Government of 2,200,000 roubles.

THE SHAME OF INFLATION.

IT is both interesting and instructive to watch the attempts to push the movement for inflation as well as to disguise its real character. A complete literature of inflation, containing matter which has not been seen in print within the present century, and which seems to contradict the whole current of American thought and feeling on the subject of currency, is rapidly making its appearance in the shape of newspaper articles, "interviews," and pamphlets and speeches. Behind these, and prompting and producing them, both in Washington and elsewhere, there is, as everybody knows, a powerful body of gentlemen, whom the late panic has badly damaged, and left either with a large quantity of unsold goods or bonds on their hands, or else a heavy burden of what it is now the fashion to call "floating debt," which stands sorely in need of "funding." These, owing to their repute as "operators," and their familiarity with the handling of large sums, are, in the eyes of a great many members of Congress, and not a few editors and reporters, financial authorities of the very highest standing, whose dicta it is dangerous to dispute and whose guidance it is not wise to refuse. If they who use so much money do not know how much is needed, who does know or can be expected to know? Accordingly, we have now a daily shower of their "views," showing how to give the currency an "elastic end"; how visionary and unpractical Smith and Ricardo and Mill and Say were in their treatment of the currency; what an exploded humbug the "specie basis" for currency is, and how unsuited it is to a young and growing country like ours; how well the greenbacks have worked; and what marvellous effects a fresh supply of them would have in "developing our resources," or in otherwise facilitating the "placing of bonds," "funding floating debt," "meeting paper," and in other ways making the world look brighter to gentlemen in difficulties.

When these ideas get into the head of a Western financier or editor who feels that he represents "the debtor class," they undergo slight modifications in order to suit them to the new latitude. He does not exactly advocate inflation, but he furiously denounces contraction as a device of Eastern "monopolists," to enable them to purchase other people's goods low and hold them for a rise, and of money-lenders who want to pinch people into high rates of interest and to foreclose mortgages. Capital, he says, is unfairly accumulated at the East, in which the talk of contraction is loudest. What the times call for is its diffusion under some equitable rule over all parts of the country; and if this distribution requires more greenbacks, more he would have. In short, his monetary system would be based upon hostility to large banking-houses and money-dealers at home and abroad. When the Workingman or the Friend of the People takes the matter up, he gives inflation a still nobler and loftier mission. He makes it one of the great instruments for giving the poor a "larger life" and wider opportunities. He therefore maintains that the Government ought to issue the currency, and that it ought, on true democratic principles, to issue enough for *all*. This is substantially the doctrine known to the European socialists as "gratuitous credit," by which is meant a system under which the state ought to establish banks where anybody could get his bills discounted, instead of as now only the rich and successful, who were thought likely to be able to pay. In France and other countries in which paper money is or was until recently redeemable, it is natural that the plan should take this shape. Here, where we have the working of a cheap irredeemable currency under our eyes, it is natural that it should resolve itself into a demand for more paper money.

Now, we do not believe that these doctrines are really taking serious hold of people's minds; but they are obtaining vogue enough to excite the surprise of those who remember what the course of public opinion in the United States on the subject of currency has been almost ever since the formation of the Government. When the Constitution was adopted, there was a widespread and well-grounded horror of irredeemable paper. Congress was, as every candid man believes, strictly forbidden by the Constitution to issue it. The great Democratic party, which sprang up so soon after the Government came into existence, and did most of the work of moulding the political habits of the country, was from the beginning the firm and unfaltering advocate of "hard money." It would not allow anything to be called money but gold and silver coin, and indignantly tore to pieces the sophisms by which every now and then attempts were made to build up a system of paper credit. Nevertheless, the Democratic party is not to-day a hard-money party. Some of the most determined foes of specie payments are to be found in its ranks, and it hugs the greenbacks with all the affection which, in its earlier days, it bestowed on the precious metals, and fills the land with windy metaphysical essays on the possibility of giving value to unlimited quantities of pulp by making black marks on it—essays over which its founders in their day roared with indignation.

Now, what has wrought this change? Why is it that the better class of newspapers and orators have to begin once more to teach the rudiments of financial science with a painstaking and elaboration which forty years ago would have seemed ridiculous? The reason is that, for forty years or more after the Revolution, the experience of the Continental paper currency, and the paper currency of the various States, was fresh in people's minds in all its sorrowful ludicrousness. The dangers of irredeemable paper and its probable consequences were familiar to every school-boy. The people knew as much about it as an economist. Moreover, they had before their eyes the experience of France, which was fresh from a grand plan of "basing" currency on unsalable lands. The story of the assignats was known in every household. Everybody laughed over the idea of "basing" promises to pay on goods which you cannot sell when the notes fall due. He held his sides when he read that a bushel-basket of paper money, secured by the pledge of vast estates, would not buy a pair of pantaloons in Paris, and he could tell you where the weak point of the system lay as well as M. Say himself, perhaps better. The rise of the wild-cat banks in the West enforced the lesson taught by the assignats. Their bills were very good until people began to question their value; that moment they were reduced from "wealth" or "capital" into pieces of dirty paper. If you had asked the men of that day whether anybody, no matter who he was, or any government, no matter what it was, could be trusted to issue paper money without being bound to redeem it in coin on demand, they would have answered unanimously, no. They knew better. They were less familiar than we are with ignorance, presumption, and rascality in high places, but they knew that the temptation was one which human virtue had never in any age or country been found able to bear.

Now, there is no doubt that an enormous mass of ignorance and credulity has been added to the voting population of this country within forty years, and that this increases the danger which many people see, or think they see, that we shall not get out of the irredeemable-currency slough without going through again the experience by which in other countries the vices of this currency have been found out; in other words, the danger that, owing to the lowering of the average of our civilization, we shall have to learn on this subject as the savage learns, not by the records of other men's experiments, but actual experiments of our own; that we shall never get back to specie payments until we shall have put out enough greenbacks to destroy their purchasing power altogether, and force us to get back to coin in the absence of any other species of money.

It ought to be borne in mind that there is perhaps no higher test of civilization than a nation's mode of dealing with a question of this kind. Want of foresight and disinclination to endure present inconvenience are the distinct mark of the savage. He gorges himself when he has food, and starves when it is exhausted. He "loafs" in summer and nearly perishes in winter. The first indication of progress is provision, however small or rude, for the future, if it be only building a hut or sowing corn; and, as he goes on, the future occupies more and more of his thoughts. Among civilized men, degrees of civilization are measured in the same way. In the

lower stages, government falls naturally and inevitably into the hands of that portion of the nation which has most capacity for looking forward; the masses are ruled because they live from day to day, and cannot be got to think of government as a thing which is to last. A desire to pillage the rich and have an equal division of goods, is simply a relic of the same improvidence which prevents an Indian from laying up stores for the cold weather; and so, let us add, is the desire to get out of present difficulties by issuing more paper money. It is not pleasant to contract, any more than to hoe corn. It is pleasant to inflate, just as it is pleasant to kill a deer and wash down the venison with whiskey, and go to sleep under a tree. All inflationists have, in fact, a strong touch of the savage in them.

Our present crisis is the more interesting because, if our Government goes back calmly, rationally, and *honestly* to specie payments, we believe it will be the first popular government that has ever done so. Nay, more, it will be the first government of any kind, except England, that has done so. The temptations of paper money have always proved too strong hitherto for any body of persons who had the power of issuing it and whose duty it was to withdraw it. The usual escape from the embarrassments caused by this mode of raising the wind has been repudiation. First, paper was issued, and it was found very agreeable, and answered its purpose. Then people said, why not have a little more? and more was issued. This was found pleasanter than ever, because everybody began to feel that he was growing rich, and further additions were made. Then, as confidence began to decline, specie was so far off that nobody wanted to travel back to it, and the general reluctance carried the day, and the paper was finally "wiped out" as worthless. In England, when it was proposed in 1819 that the Bank should be forced to resume, there was precisely the same opposition there that there is here, and the same arguments were used against it. Any one who will give himself the trouble to read the debates on the Report of the Bullion Committee, and the evidence taken by it, will find all the Kelley, and Butler, and Phillips nonsense set forth in masculine language. He will find that irredeemable bank-notes were "the best currency, sir, the world ever saw." He will find that they had "the entire confidence of the people, sir," and that the hard-money men were leeches who wanted to precipitate a crisis and buy up the people's substance cheaply. He will find that it was not the paper which had depreciated 25 per cent., but gold which had risen to that amount in value. Mr. Ricardo's ablest paper was written to refute this very proposition, set forth by a violent opponent of resumption. He will find also a great deal of drivel about foreign exchange and other matters which would not in our day be listened to at all, coming from bankers and merchants of high standing. The Bullion Committee was, however, composed of men who knew how to study and reason, and who had no "floating debt" to "fund," no goods "to work off," or bonds to place; they had weight enough to resist "pressure," made a report which is an exhaustive treatise on the principles of currency, and brought resumption about. If the people of the United States compel their Government to pay its paper debt in hard coin, they will do something which no community of the same size and character has been civilized enough to do, what no monarchy has been honest enough to do, and will afford the most striking illustration of the advance of foresight and self-respect among the race which we have yet seen.

THE CONDEMNATION OF BAZAINE.

THE conviction of Marshal Bazaine of the crime of having capitulated without having done all that honor and duty required, whether justified by the evidence or not, will serve a good purpose in soothing the wounded susceptibilities of the French people, and in reviving, in however slight a degree, the sympathy which during the early part of the war united men of all parties. One of the marked characteristics of sentimental politics is the powerful part played in it by "traitors." Politics is, perhaps, nowhere so sentimental as in France and Ireland, and we accordingly find that, in the history of both countries, the influence of spies, informers, and corrupt generals and statesmen upon the march of events has been great, and often disastrous.

The Sentimentalist does not reach his conclusions, either in the council or in the field, through a calm weighing of facts, but through a species of afflatus, to which he gives various names, but the source of which he secretly believes to be supernatural. He is accordingly fully prepared to attack the strongest and best disciplined army with a crowd of excited peasants, or to march through a hostile territory with a small band of right-minded volunteers, and can never wholly rid himself of the belief that an unseen power is fighting on his side, and will turn the scale in his favor by suspending the rules of strategy and tactics. When things go wrong with him, therefore—when his army is arrested by the police and taken to the lockup, as happened to the Fenians, or his singing volunteers are scattered like chaff by the remorseless advance of a trained and silent battalion, as so often happened to the French during the late war—he is forced either to give up his theory that Providence takes special care of excitable people who are sure they are right, or to fall back on the hypothesis that some bad man has sold his secrets to the enemy—and he naturally chooses the latter. When he enters on a campaign, one of his first steps, after having concluded his speeches and sung his battle-hymn, is to hunt for "spies," which he does with about as much discrimination as his forefathers displayed in hunting for witches, and, when the fighting begins, he keeps a lynx-eyed watch on his generals, to prevent their being bribed by the enemy. In the first Revolution, the Jacobins had detectives called "commissaries" with the various armies, looking after the commanders, to prevent their betraying their own government. And during the late siege of Paris, the Reds clamored in vain to have the officers of the various corps accompanied by armed representatives of "the people" outside the walls, in order to prevent the corrupt intercourse with the Germans which they were sure was carried on.

It is not wonderful that with this tendency of the national temperament in active operation, the principal army officers should, after the fall of the Empire, have become objects of deep suspicion to the Radicals of the towns. In nearly all the great cities of the South they were, through the most of the war, in constant danger of being mobbed, and M. Gambetta rather encouraged than repressed this frame of mind. He had himself come out of Paris literally on the wings of the wind, and was full of the divine afflatus, and believed in it. He thought that nothing but will was necessary to victory, and saw treason or cowardice in the sighs and shrugs and hesitation with which the real soldiers received the plans by which he proposed to crush Prince Frederic Charles, and overwhelm Werder, and throw Moltke into the English Channel. As the fortune of the war after the surrender of Sedan really turned on Bazaine's ability to hold Prince Frederic Charles at Metz, while new levies were organizing at the South, the Marshal of course became from the first moment an object of uneasy scrutiny. If he gave way one minute before Gambetta's new army was ready to march on Paris, he was certain to be accused of treachery, even if he had lived for weeks on leather and fought a pitched battle every Monday. His surrender led to the total collapse of the Southern attempt to relieve the capital, and Gambetta, whom this collapse overwhelmed with ridicule, at once accused him of treason, and the whole nation, in the agony of despair and humiliation, seized on the accusation as the one bit of comfort left them. It was hard to believe that a "Marshal of France" could surrender unnecessarily with 150,000 men, but it was easier than to acknowledge that France, the foremost military nation in the world, as they fondly thought her, had been fairly conquered in one campaign by a single enemy.

Unhappily, there appears to have been plenty of reason for believing that at least he did not do his best. Much of the evidence received against him on the trial was preposterous or incredible, but it was plain enough that he had not done all that he might have done, and that, whatever the condition of his heart, his defence of Metz brought him within the purview of the military law. It was at best a feeble

defence, conducted by a man who clearly did not believe that it would seriously influence the result of the war either way, and that to conduct it to the point of desperation would have been a useless sacrifice of life and material. But then, he was on the trial the victim of a good deal of epigram and phrase-mongering. For instance, when he said, what one can readily understand his thinking without the slightest want of patriotism or honor—after he had heard of the revolution, of Sedan, and of the appearance in the Provinces in a balloon of a flighty young Radical lawyer as the sole representative of the civil power—"that there was no Government, there was nothing," the Duc d'Aumale easily knocked him down, and excited deep sensation in court by exclaiming, "What! did not France still exist?" Probably the Marshal half lost his cause through this clever repartee; and yet nobody who tries to put himself in his place at Metz, with his training and antecedents, can feel that there was anything in the Marshal's own remark beyond *gaucherie* in expression. What he meant was that France was not represented by any organized body capable of directing a war or concluding a peace, which was strictly true, as an Assembly had to be elected in order to treat with the Germans. A soldier of the highest type would have none the less fought on, and fought well. But it is hardly fair to shoot a man for not having reached the summit of devotion, or for not having flung himself into the gulf for the mere honor of the flag.

This brings us to what was Bazaine's real defence, though it was one which of course he did not dare to offer. He was a fair product of French political life; in other words, French society was responsible for him. His defence of Metz was the defence which it was natural for a soldier to make who had passed the last forty-two years in the French service. During that period, he has witnessed four revolutions, and served four governments, each of which claimed legitimacy, and has seen four sets of soldiers and statesmen, who on Monday were honored and respected, flying as criminals on Tuesday. The natural and proper consequence of this is to shake the sentiment of allegiance to country in the breasts of state servants, and to lead them to look out for their personal interests by attaching themselves to whichever régime seems to them most likely to prove stable, without reference to its general merits. Fidelity to Louis Philippe's Government was treated as a crime by the Republic; fidelity to the Republic as a crime by the Empire, and so on. No patriotism is entirely proof against ordeals of this sort, and they are especially trying to coarse and sensual natures, such as Bazaine's undoubtedly is. Moreover, the Empire, which it must be remembered the French people twice solemnly adopted and approved by universal suffrage, used all its influence and patronage to raise to the front rank the class of soldiers to which Bazaine belonged. The French army, when the war broke out, was almost wholly in their hands, and Bazaine was not by any means the worst of them; he was simply the most conspicuous. Indeed, the only Imperialist favorite who issued from the war with untarnished reputation was MacMahon. These adventurers, too, with the Emperor at their head, had reached the age when campaigning becomes distasteful, and had attained all the honors and rewards that campaigning could give. The influence of this circumstance on French strategy was mournfully recognized by the first Napoleon in his later wars, when his Marshals had grown old and rich, and shrank from flinging away the few years of well-won repose that remained to them. It is, indeed, only long-settled governments, which are deeply rooted in men's hearts, and which they have learnt to love in childhood, that can exact from the old the eager devotion which shrinks from no danger and welcomes the weightiest responsibilities. From fortune-seekers, to whom the existing government represents nothing but pay and place, and any other may mean poverty and obscurity, it is impossible to expect the disinterested remembrance of country which Bazaine has been condemned for not showing; and this class the Napoleonic régime was extraordinarily successful in producing and rewarding.

There is one ground on which, perhaps, more than on any other, his condemnation may be, and even his execution would have been, justified. A country which changes its government as often as France does, and in which no one system or régime or dynasty has more hold on the popular imagination than another, in which all political traditions have been uprooted and political habits destroyed, and which nevertheless is forced to keep up a large standing army, either for defence or police, must, in order to save itself from ruin, sternly prohibit the meddling of soldiers in politics, or the exercise of any option by soldiers between one government and another. The *de-facto* government must be the only government the general knows anything about; and to secure this result, the killing of any number of generals would be a low price to pay, because if the army once gets the habit of deciding between rival candidates to power or recognizing any claim to authority but possession, politics resolves itself into a struggle for the support of the army through corruption, and the army becomes a lazy or licentious Prætorian Guard—useless in war and dangerous in peace. France has been saved thus far from the degradation of Spain and Mexico by her success in maintaining military discipline through eighty years of revolution. That this success has been largely, if not mainly, due to the triumphs of the army in foreign wars during the early part of the century, and the strong traditions of discipline thus bred, nobody can doubt. If, now that its prestige is gone, it should seek compensation for reverses in the field by taking charge of the government at home, social order itself would be put in serious peril. Bazaine's course at Metz undoubtedly, even if unconsciously to himself, had the seeds of this awful disease in it, and to arrest such a plague no treatment can be too severe. When the Duc d'Aumale, therefore, reminded him that though governments might come and go, France herself was the soldier's only concern, his words were more important as the utterance of a great political truth, which it was the business of military men to heed, than as a crushing retort to the unhappy old prisoner. For, unhappy we must call him after all. Forty-two years of danger resolutely faced, and of duty on the whole well done, by day and by night, in all forms of danger and distress, must, as long as men are men, go far to cover even worse sins than he has committed.

THE TRUE HISTORY OF A GREAT MINING ENTERPRISE.

IN the Little Cottonwood Cañon, in the Territory of Utah, on the Wasatch range of mountains, and about sixteen miles from a station called Sandy, on a branch of the Union Pacific Railroad, is a little spot of ground whose fame, though the growth of only a few years, has already spread far and wide over the surface of the earth, and promises to be handed down to future generations, if not in song, at least in the records of financial and political ethics, as one of the most remarkable places on the surface of the habitable globe. In 1868, two prospecting miners, of the names of Woodman and Chisholm, wandering about through the cañon, suddenly became aware that on the side of one of the hills there were evidences of silver ore, and being, like most prospecting miners, though rough in manners and appearance, of an imaginative turn, they determined to consider their discovery a mine, and to name it after a lady with whom one or possibly both of them had been illicitly consorting in San Francisco, and whose Christian name was Emma. This they did, but, having no capital to work their discovery, it seemed at first that the christening of the mine might be all that would ever happen to it; when, very fortunately, one fine day there appeared on the scene a certain Mr. James E. Lyon, whose business was that of a mining speculator, who agreed to join Woodman and Chisholm, and advanced them money, he receiving a one-third share in the mine as an equivalent.

During 1868 and 1869, one hundred tons of ore were got out, and Mr. Lyon, not being much pleased with the prospect of his enterprise, went back to New York on other business; first, however, having satisfied himself that the lode ran in a northwesterly direction—a fact which we must beg the readers of this article to remember; for though the direction of a lode seems to be one of those things which would not be apt to escape the memory of any one interested in it, it will be observed throughout this strange tale that the business of silver-mining, at least in the Wasatch range, seems to impair the mnemonic almost as much as it improves the inventive faculties of the mind. To New York, then, went Lyon, having first made up his mind that the lode ran in a northwesterly direction, and, singular as it may seem,

no sooner had he disappeared than the Emma became suddenly productive, a large body of ore was struck, and Messrs. Woodman and Chisholm, not caring so much for the niceties of partnership law as for silver, took in some new partners, and came at the same time to the conclusion that it was necessary to oust Mr. Lyon, on the ground that the vein now opened out was running in a different direction from what it was when the original shaft was sunk. Into the Emma Silver Mine of Utah these gentlemen had now organized themselves, and between Lyon and the Emma Silver Mine a suit raged for three days in the District Court of Utah, in which were engaged no less than seventeen lawyers, and among them, as Lyon's principal attorney, the Hon. W. M. Stewart, Senator for Nevada. What Lyon desired was an inspection of the mine, in order that the defective memories of his former partners might be refreshed as to the direction of the lode. He gained his suit, and, on the inspection, it proved that Lyon was right, and the direction of the lode was northwesterly. His suit was thereupon compromised; but, to understand the nature of the compromise, it is necessary to turn to other scenes and introduce new characters.

Vermont of late years has been the cradle of great men. From Vermont came Fisk; from Vermont came the gentlemen who have lately organized the Vermont Central Railroad; from Vermont, too, came Trenor Wm. Park. Originally a country lawyer in that State, he came early to the conclusion that the confined life of New England was too narrow for a man of his metal, and he went to practise in San Francisco—a city in which the practice of the law has the great advantage of including, among its legitimate and recognized weapons, what are still considered in the less progressive communities of the Eastern coast the crimes of champerty and maintenance. Like most of the gentlemen who have begun their careers as country lawyers in Vermont, and then emigrated to develop wider spheres of usefulness elsewhere, Mr. Park first really obtained distinction as a Receiver. It was the celebrated Mariposa Estate which he received, and so well did he perform his duties that he is said to have acquired the name among his friends and admirers of the "Great Exhausting Receiver." It may be inferred from this that Mr. Park had acquired no small knowledge of mining law; and when we say that about March, 1871, he and one General Baxter made a careful inspection of the Emma, it is tantamount to saying that they came at once to the conclusion that the mine had been badly managed. To improve the property they purchased one-half of the mine, and when Mr. Lyon's compromise came to be arranged, it was found that such had been their energy in developing its resources that they had already spent $1,500,000 upon it, with no returns. In any comprehensive scheme of improvement it was necessary that this money should be restored to them, and as neither Mr. Lyon nor Messrs. Woodward and Chisholm had that amount of money on the spot, development could never be complete without a sale of the mine. But to place the mine on the Little Cottonwood Cañon market was difficult, for the same reason that in the old English song the gentleman who put a rope round his wife's neck and took her for sale to the market town found it difficult to dispose of her: in the Little Cottonwood Cañon the population were "all of them sellers." There were a dozen mines within easy reach, but there were no quotations in the Cañon. To people who were really interested in a comprehensive scheme of development, there was but one thing to do. The mine must be sold—at a distance. The mine must be sold where money was plenty and the nature of cañons unfamiliar. The mine must be sold in London. The name was changed to the "Emma Silver Mining Company of New York," and Mr. Lyon was compromised with on the understanding that he should receive one-eighth of what the mine sold for, less the $1,500,000 (which Messrs. Park and Baxter had theoretically expended in their first attempt at development), in consideration of his, Lyon's, holding over his claim till the 15th of November following, while an United States patent was being got. Before Mr. Park and Senator Stewart went to London, however, there were one or two matters to be attended to. There must be an inspection and report upon the value of the mine by an expert, and, in order that this report should be all that it ought to be, there must be some preparation of the mine. Mr. Silas Williams, it seems, is admitted by Mr. Park to be about the best man in his acquaintance to prepare a mine, and Mr. Williams was sent for. In the month of September the number of men working on the mine was reduced from a hundred to a dozen. No one was allowed to go into the mine without a written order, and armed men were stationed as guards at the entrances, while Mr. Silas Williams occupied himself in plastering and engrafting silver ore on to the limestone rock. The mine was now nearly worked out; there were 1,500 tons of ore raised and on hand, and the value of the mine was, in Mr. Park's opinion, at that time expressed, about $250,000. The details of the preparation being arranged, Mr. Park and Senator Stewart sailed for England. Professor Silliman of Yale College had been through the mine, had seen the plastered walls, and made a very interesting and instructive report, for which he is said to have been promised $5,000, and a second sum of $45,000 if the sale in England was accomplished.

The scene changes now to England, where we find Mr. Park and Senator Stewart, armed with Professor Silliman's report, trying, at first without success, to float their scheme. To investors, silver mines seem a little speculative, and the history of investments in Erie had not tended to strengthen public confidence in new and unknown American securities, promoted by old and well-known American speculators, even when reported upon by the "Sir Roderick Murchison of the United States." If Mr. Park had not been a man of real genius, the scheme might never have been floated to this day. But Mr. Park was a man of genius, and it occurred to him that if the new English company were headed by General Schenck, the American Minister in London, it would probably acquire a reputation at once. General Schenck having little or no money, it was arranged that money should be provided him, and that he should thus enter the company as a *bona-fide* investor. This was no less important than the preparation of the mine by Mr. Silas Williams.

On the 9th of November, 1871, the Prospectus of the Emma Silver Mining Company, Limited, appeared, announcing the formation of the new company with a capital of £1,000,000, in 50,000 shares, of which 25,000 shares were offered by subscription, the vendors retaining the other 25,000. The directors were announced to be: George Anderson, Esq., M.P., London, *Chairman;* E. Brydges Willyams, Esq., M.P., London, *Deputy Chairman;* Percy Doyle, Esq., C.B., London; E. Leigh Pemberton, Esq., M.P., London; The Hon. J. C. Stanley, London; Major-General Schenck, United States Minister, London; General Henry Baxter, Ex-President N.Y.C. Railway, New York; Trenor Wm. Park, Esq., President National Bank, Vermont; The Hon. W. M. Stewart, United States Senator, Nevada. The trustees were to be: George Anderson, Esq.; Major-General Robert Schenck; and J. H. Puleston, Esq. (of Jay Cooke, McCulloch & Co., American Bankers), London. These three gentlemen were to act as trustees for the shareholders until the property purchased was duly transferred; and until that was done, no part of the purchase-money was to be paid.

The property meanwhile had greatly increased in value. There was in the first place: cash, being the balance of accrued profits receivable from consignments of ore by the vendors to London and Liverpool, amounting to £46,300. There were 2,800 tons of first-class ore being forwarded to England, of the estimated net value of £70,000. There were 8,000 tons second-class ore, piled up at mine for smelting there, of the estimated net value of £64,000. There were 13,250 tons first-class ore, already developed in various parts of the mine, of the estimated net value of £357,750. And there were also 2,600 tons first-class ore from mine to London expected to arrive during January and February, and to produce, net, £65,000. It was stated also that the ore previously sent to England had realized an average of £37 19s. 3d. per ton. The cost of extracting the ore ready for shipment or sale had hitherto been under 15s. per ton, or only about two per cent. of its value, a fact unprecedented in the annals of mining. Judging by the profits of the preceding four months' working, the estimated net yield of the mine would be at the rate of £700,000 per annum; or if smelting works were erected, as the proper business way to do, then the total profit would amount to the enormous figure of £800,000 per annum. Furthermore, with a view to equalize and ensure the steady and continuous payments of dividends, the divisions of profits were to be restricted to 18 per cent. per annum, until £180,000, equal to twelve months' dividends, were in hand in London, after which time the whole of the earnings were to be divided among the shareholders.

Mr. Park received £500,000 in cash, settled with Mr. Albert Grant (an English speculator, as expert in rigging the market as Mr. Silas Williams had shown himself in preparing, plastering, and engrafting) for £100,000, and a further prospective sum of £60,000 or £70,000 more, which he seems to have got afterwards, while with Mr. Jas. E. Lyon, entitled to one-eighth of the purchase, less $1,500,000, a compromise was effected by which he got £30,000 for his whole claim, Mr. Park very kindly letting him know that a peculiar arrangement had been entered into, by which the whole of the London shares were locked up and inaccessible, in the hands of Mr. Grant, for nine months or more, and that before the expiration of that period, in all human probability, the "game would be played out" and the mine "bust up." Mr. Lyon being thus got rid of, the other old claimants renounced all their rights in favor of Mr. Park upon the payment of fifty dollars a share, and in consideration of an undertaking on the part of Mr. Park to make up to the new London company for any discrepancy between the actual amount of first-class ore and the 2,800 tons mentioned in the prospectus. It is hardly necessary to say that as there were only 1,800 tons of this ore in existence, Mr. Park at once paid over to the

London Emma Company £28,000, and the London Emma Company entered the payment in their books as received for "missing ore."

After this, everything went on beautifully. There was, to be sure, here and there an adverse rumor in circulation, and General Schenck was obliged to resign his position as director; but that was only a matter of diplomatic etiquette, and had nothing to do with the merits of the mine; and the 18 per cent. dividends now began to be paid, together with an announcement from the directors that they had "taken great pains to verify every statement in the prospectus," and were "confirmed in their opinion" that such statements were "strictly accurate." The production at the mine went on increasing, for on the 1st of February, with the monthly dividend, came a statement of "ore sold at Utah, 1,000 tons—£28,000," which was the same quantity *short* from the 2,800 tons which is referred to in the prospectus as "now at railway station, *en route* to London." On the 7th of March, a meeting of the company was held, at which Mr. G. Anderson, the chairman, stated to the shareholders that silver was coming out of the mine so fast that it seemed very likely that they would get "30 or 40 per cent. instead of 18." Meantime, to dispel the rumors which had sprung up about the Company, Mr. Park offered to pay the expenses of the whole of the Board if they would only go out to the Little Cottonwood Cañon—if they would only go out and examine the property for themselves. This they did not care to do; but Mr. Brydges Willyams did, receiving a check for his trouble of £5,000. With Mr. Willyams, as a personal friend, went Mr. G. A. Lawrence, better known as the author of 'Guy Livingstone' and other works of fiction; and the result of his connection with the enterprise is a very agreeable instance of how much any development of the resources of nature benefits not merely those directly interested, but all classes of the community. Mr. Lawrence, a literary man, and not skilled in mining, was much struck with what he saw in Utah, and on his return wrote a book called 'Silverland,' containing a chapter devoted to the Emma Mine, for which he received a thousand guineas from his publishers, while his expenses were paid by his friend Mr. Willyams. One of the malicious rumors about this trip was that Mr. Park sent word out that Mr. Willyams was to have a home provided for him both in New York and Utah, and that he was on no account to be allowed to go anywhere near a hotel or converse with suspicious characters. With Mr. Willyams went Mr. Stewart and Professor Silliman, and the reports received from the mine were so favorable that, on the 1st of April, 1872, the directors invited the stockholders to take the locked-up and inaccessible vendors' shares, the directors being desirous of getting a quotation on the Stock Exchange, and it being necessary for this that more shares should be held by the company itself. The only difficulty, they said, was about the price; but they had succeeded in inducing the vendors to dispose of shares at £23—the market price. The shares were taken, or taken in great measure, and everything went on even more swimmingly than before, although, strange to say, no quotation was granted. The papers stated that "the directors would be in possession of the £180,000 reserve in a few days, and would then immediately commence paying 36 per cent. dividend." A pamphlet by "Nummus" appeared, called 'Mining Enterprise in America, as illustrated by the History of a Great Investment,' which was printed by a respectable publishing house, Messrs. Cassell, Petter & Galpin, and in some way seemed to have been published by them, though it was not, and they knew apparently nothing about mining enterprise in America. Extracts from this were made in such papers as the *Mining World* and *Stock Exchange Review*, and sent free to every stockholder. On the 1st of May, the directors announced the return of Mr. Willyams with highly satisfactory accounts, and a meeting was held on the 7th of that month to hear them. Mr. Willyams, having lost his father, could not attend it; but a letter from him was read, in which he expressed the opinion that the property was "honestly worth more than double what it was three months ago," while Mr. Silliman's second report said that the recent discoveries were "a guarantee for the future of regular and satisfactory dividends"; and on a stockholder venturing to enquire if he might be informed "what amount of ore was actually in sight, seen, and measured," the chairman, Mr. Anderson, advised him to read the reports and he would find that Professor Silliman vouched for 32,000 tons. On the 1st of November, the directors announced the quantity of ore raised to date as 10,190 tons. The monthly dividends went on, the thirteenth being paid on the 2d of December, 1872, and, on the 10th of that month, Mr. Anderson made a report, detailing his visit to the mine, giving a glowing account of the property (the ore raised was 11,420 tons), and paying a high tribute to the loyalty and disinterestedness of Messrs. Park and Stewart.

With this gratifying tribute, the history of the Emma Mine may be said to close. To be sure, there is an appendix in the way of charges and explanations and balance-sheet and proceedings by stockholders, but these are proceedings relating to individuals, their private fortunes, their integrity, and so on. But, as a mine, the Emma on the 10th of December, 1872, ceased to exist. There were no more dividends, there was no more ore either in Utah, or in New York, or in London, or on the high seas, to arrive. The 32,000 tons vouched for by Professor Silliman had disappeared, so had the 11,420 tons raised, so had the £46,300 "cash on hand," which was an imaginary sum paid over first in the purchase-money to the vendors, and repaid the next day to the Company; so had £195,000 in dividends, the money for the last two of which it seems had been lent to the Company by Mr. Park, as it was itself insolvent; and, in fact, the mine had netted about £47,000 from the 8th of November, 1871, to the 31st December, 1872. Meanwhile, it appeared that the Company had been mining on ground not their own. It will be remembered that the mine ran northwest and southeast, but the company which got the patent discovered that in a northwest and southeast direction there were other claims, the Illinois, the Cincinnati, the San Francisco Emma, and the North Star, all working close by. So in order to avoid this difficulty the patent was taken northeast and southwest, while the mining was done northwest and southeast—in the true direction of the lode. By this arrangement they secured a good title in their patent, and at the same time it did not in reality make very much difference which way it was worked, for it would "bust up," as Mr. Park said, in a few months at any rate. In this way they mined their way into land of the Illinois Company, and the balance-sheet disclosed the fact that they owed the Illinois Company £18,000 on this account, which reduced the £47,000 to £29,000. As to the quantity of ore remaining in the mine Mr. Park says: "No one can tell as to the quantity of ore remaining in the mine, save Him who made it"; this being supposed to be a pious reference to the Creator of the Universe.

There are one or two more things which it is necessary to state in order to explain the nature of the source from which this information all comes. In November, 1871, one S. T. Paffard, having a little money to spare, and seeing a notice of the Emma Company in some newspaper, obtained a prospectus, and became strongly impressed with the statements contained in it, vouched for by such names as it bore, and especially by the name of Gen. Schenck, the United States Minister. Being desirous of adding to his income, he took such shares as were within his means, not on speculation, but as an investor. When the bubble burst, he determined to find out why it was that shares were worth £3 which had been worth £23, and he has spent much time and trouble in correspondence and examination, and has in the end got together the real history of the enterprise, in a little pamphlet dedicated "To the shareholders of the Emma Silver Mining Company (Limited), and to the shareholders in mines of a similar nature in Utah and Nevada." He gives, in an interesting and instructive appendix, his correspondence with the eminent gentlemen connected with the enterprise, and, with a hopefulness which is certainly to be commended in one who has bought his experience so dear, he takes as the motto of his True History of the Emma Mine "*Magna est veritas et prevalebit.*"

LOUIS AGASSIZ.

SELDOM, if ever, has the death of a man of science been so widely and deeply felt as in the case of Professor Agassiz, who departed this life on the evening of the 14th inst. He was born at Mottier, near the Lake of Neufchatel, in May, 1807, and was therefore in his sixty-seventh year. His father was the pastor of the parish. Early choosing the medical profession, probably because of its affinity with natural history, for which his fondness was manifest in boyhood, he studied in the schools of Lausanne and Zurich, in his native Switzerland, then at the universities of Heidelberg and Munich, taking the degree of Doctor in Medicine at the latter at or before 1830, having already taken that of Doctor in Philosophy at Erlangen. By this time, if not long before, under the stimulus and example of such teachers as Döllinger, Martius, and Oken, and with such student-companions as Schimper, Mohl, and Braun, his destiny as a naturalist was fixed, and his career opened. That Von Martius should have chosen his pupil (Spix having died) to work up the fishes collected in his and Spix's Brazilian expedition was natural, for young Agassiz probably even then knew more of the fresh-water fishes of Europe than any one else; and this, his first piece of systematic zoölogical work, probably impressed upon his mind a special interest in Brazil and its fauna, which was gratified in after-years under nobler opportunities than falls to the common lot, resulting in an accumulation of materials in all departments, and especially in ichthyology, which might satisfy in this respect even the largeness of Agassiz's mind. Would that his subsequent days could have been mainly devoted, as he once or twice essayed to devote them, to the elaboration of these and other unequalled ichthyological collections; that he might have rounded his life by a completed work in the department which first gave him fame, for which he re

tained a predilection, and in which so much remained for him to do. In the year 1832, or thereabouts, Agassiz accepted the chair of natural history in the college of Neufchatel, in which Guizot was one of his associates. Here, having secured in Baron Cotta a publisher able and willing to respond to his desires, he brought out his 'Natural History of the Fresh-water Fishes of Central Europe,' and the fourteen livraisons (with 311 plates) of his 'Researches on Fossil Fishes.' And from this base, with the range of the Bernese Alps towering in the horizon before him, he carried on those elaborate investigations upon *living* glaciers, and developed those views respecting their former overwhelming agency which are recorded in his 'Etudes sur les Glaciers' and his 'Système Glacière,' as well as in the publications of various learned societies, and which have made his name illustrious in the annals of geology also. The comparatively untechnical character of these investigations (except as to the intimate cause and process of glacier movement), adapting them to general apprehension; the leading part they have ever since played in recent geology in questions relative to the age, introduction, and distribution of species, and over the whole field aptly denominated in French *physique du monde;* the persistent ardor with which they were undertaken and expounded, yet without pretermission of his more recondite zoölogical researches; and the unfaltering courage and confidence with which they were at once carried out to their full legitimate consequences (a characteristic trait of their author's mind), naturally captivated no less the popular than the scientific world, who joined in assigning to Agassiz a place by the side of his friend and early patron Humboldt. The two had more than one point of resemblance, and it would be curious to trace the parallel.

In 1846, at middle age, he came to the United States on a scientific visit, with leave of absence and some assistance from the King of Prussia as suzerain of Neufchatel. He delivered in Boston a course of Lowell lectures, and other similar lectures in several cities. He was just the man to be fully appreciated here; and the field which he found, or saw the capabilities of, was most inviting to one of his zeal, ardor, largeness of view, bold and contagious hopefulness. He decided to remain, and he did remain, unswerved by flattering attempts to win him back to Europe. Under an endowment of the late Abbott Lawrence, he became professor of zoölogy and geology in Harvard University in 1847, and was fulfilling the duties of the office when the fatal illness seized him. Of his work and his influence here through this quarter of a century; of the great museum of zoölogy which he established and replenished, and upon which he lavished heart, and time, and means; of the zoölogical investigations he has here made, and those he has incited and promoted; of those four imperial quarto volumes of 'Contributions to the Natural History of the United States' which stand a memorial of what science, seconded by zeal and noble patronage, may accomplish, but may by the largeness of plan be unable to complete; of the exploration in Brazil, its princely outfit and ample returns; of the recent *Hassler* expedition round the continent, adding its proportion to the vast stores accumulated at the museum, but most of all, as we fondly deemed, the inestimable benefit of restored health and vigor to the naturalist, whose remaining days were now doubly and trebly valuable for science; of that fatal gift, the rock of Penikese, covered last summer with an admiring, active-minded throng, who little dreamed what life-blood they were consuming, now desolate and plashed by December waves that moan like dirges; of the characteristic traits, scientific and personal, of the naturalist and the man who is now lamented—of all these, we have not room to write. Nor, indeed, is it needful for our readers, for probably there never was another eminent naturalist so widely personally known.

Noble lessons and inspirations are to be drawn from Agassiz's example, and one warning. Probably the warning may not be much needed again in our day, for not many naturalists of the highest order have the gifts which cause them to be beset, or even the disposition to estimate at its proper worth the value of a popular appeal. Our ideal naturalist, in this regard, would be a cross between Robert Brown, whom his scientific compeers ranked as *facile princeps*, while very few even of his best-educated countrymen ever heard of him, and one who, like Agassiz, was "known and read of all men," and who longed that all should share in all he knew. But naturalists capable of large, original researches are few, and always likely to be overtasked, and their precious time should be jealously guarded. This is especially applicable to those who can not only investigate well, but shape and systematize. And here a brief remark may not be out of place—considering that perhaps the last printed words from Mr. Agassiz's pen, not yet issued, relate to it—upon his position in respect to a popular doctrine of the day. Agassiz early came in contact with the Naturphilosophie of Oken, which he much disliked, and one would say with fair reason. In philosophy he was a pupil of Schelling at Munich, after Schelling's conversion from idealistic pantheism. As a naturalist, although morphology was his *forte*, the school of Cuvier engaged him more than that of St. Hilaire. Purport and plan were more to him than ways and means, and physical cause and effect. Never was there a more thoroughly theistic philosopher. His iterated argument against doctrines of evolution, reduced to simplest terms, is this: 1. There is order and system in organic nature, such as indicates thought; 2. The evolution of species of plants and animals, one from another, by natural causation, is tantamount to a denial of this. 3. Therefore, doctrines of evolution are untrue. If the second term be conceded, most people will agree with him.

It was not badly written of Agassiz by one of his literary contemporaries, that "he is a scientific force, and no small portion of the immense influence he exerts is due to the energy, intensity, and geniality which distinguish the nature of the man. . . . He is at once one of the most dominating and one of the most sympathetic of men, having the qualities of leader and companion combined in singular harmony." His mark and rank were recognized by all appropriate scientific and literary honors. He received the Monthyon and Cuvier prizes in Paris, the Copley and the Wollaston medals in London, the LL.D. from Edinburgh, Dublin, and Harvard Universities; was elected into all the great scientific academies and societies, and, last and most prized, was one of the eight Foreign Associates of the Academy of Sciences at Paris. A peculiar plant which inhabits the southern borders of his adopted country, with deliciously-scented flowers, bears the name of *Agassizia suavis*. Mr. Agassiz early married a gifted sister of Professor Alexander Braun, by whom he had three children, who survive him: two daughters, married in this country, and a son, whose investigations in the zoölogy and comparative anatomy of radiate animals have already placed him very high in the ranks of scientific men. Of the surviving Mrs. Agassiz (*née* Cary), the ever-helpful companion and associate in voyage and travel, as well as in literary and scientific work, it would be superfluous to speak.

Correspondence.

PLYMOUTH CHURCH DISCIPLINE.

To the Editor of the Nation:

Sir: I understand you, in your number for December 4, to state in substance and in various forms that Plymouth Church and their pastor have abandoned the theory of a distinction between the church and the world consisting in a change of heart and of life, as the basis of church organization; the church is represented as declaring that "church-members may or may not be Christians or good men—about that it does not concern itself. The one thing certain is that they like to come to the building on Sunday, and are strong in their devotion to philanthropic enterprises. In short, the church is not an institution. Its members are not held together by any visible bond. They are persons who like to expose themselves to spiritual influences, but have nothing to say as to the effect of these influences on their character." You naturally and properly express great sorrow at this result, regarding the Puritan Church as a very important conservative element of human society, and especially in these democratic ages.

Whether Plymouth Church has taken this ground or not is simply a question of fact. If it is a fact, then the evidence of the fact can be produced. What, then, are the sources of evidence in this case? I know of none but its fundamental constitutional documents, or some authentic public declaration of the church. Let us, then, first turn to the fundamental documents of the church, and see how men are admitted to this church and what obligations they assume. I refer you to page 17 of the 'Manual' of the church. The candidates are publicly addressed before the audience, and this address assumes, what is a fact, that they have been examined as to the evidence of a change of heart and life, and are now to profess the same. The pastor says to them: "You have been deeply convinced of your personal sinfulness; you have believed in the forgiving love of Jesus Christ; you have dedicated your heart and life to him; that dedication you are about to renew, in the presence of God and this congregation."

What, now, is the essence of the covenant into which they enter? It is to renounce a life of sin, and "to consecrate the whole soul and body to the service of God." What does the church covenant? It is "by all means in their power to advance those who join them in the divine life."

Can there be a more explicit declaration of the basis of the church in a professed change of heart and life? But now the question may be raised, Has not this basis been repudiated? Certainly this is a fair question, and it leads to the enquiry, How can such a constitution be repudiated? Is it by a single speech of a member, even if he were the pastor? Is not an action of the church essential to effect so fundamental a change? Has there been

any such action? It is not possible to produce any such action. But it may be said that the pastor's speech, sanctioned by the church, implies it. Does the pastor, then, in either of his speeches repudiate what has been to this time the original and perpetual basis of the church? To this I answer decidedly, no. On the other hand, in both of the speeches of the pastor recently delivered, he has emphatically reaffirmed it. But, it may be asked, did not the pastor say that "the door of entrance to the church should be as large as humanity"? He did. But he did not say that alone. He did not say that any could enter it without professing a change of heart and of life, for he proceeded immediately to say: "It was designed to give an invitation to all to come into the church who really felt a desire to come in through faith in Christ, for the purpose of a loving obedience to the Lord Jesus Christ, and to all persons who gave reasonable evidence of the sincerity of their purpose of holy living." In his second speech the pastor said: "I have said time and time again in your hearing that only those who were convinced of their profound sinfulness and of the need of divine help, and who accepted Jesus Christ as their Lord and Saviour, were invited to come to the communion table, no matter whether they were church-members or not. And that has been the ground on which I have stood at the door of the church and asked, 'Do you come because you are sinful and helpless—because you believe Jesus Christ has begun to help you? Do you come leaning on him into this Christian brotherhood? That has been the *only* ground on which men have come into this church.'"

That these reports of the pastor's speeches are correct I know, for I heard them both. What now can be said to rebut this evidence? Ought any one to affirm that Plymouth Church has forsaken her original basis, not only without evidence, but against such evidence as this?

How has it happened, then, that not only secular but even some religious papers have taken this view of the case? I answer, it is owing to a defective report of the first speech of the pastor and to a false construction put on what was reported. The statement "The door of entrance to the church should be as large as humanity," has been re-echoed and taken without the limitation immediately added by the pastor, that no one could enter it who did not profess repentance of sin, faith in Christ, and a sincere purpose to lead a holy life. But one would think that newspaper reports have not always been so full and so infallible as to warrant any man in bringing such a charge against such a church until he knew that the newspaper report was neither inaccurate nor defective.

But it may be said that the pastor disavows discipline. It is true that he does discountenance a frequent resort to *judicial processes* and a *litigious* spirit in the church, and a reliance on mere legal proceedings as a means of promoting a holy life. But he insists earnestly on that highest and noblest discipline which arises from the full development of the spirit of the Gospel, the spirit of love, and its application not merely to church services, but to the whole intercourse of life and to all the interests of human society. To this his sermons for years bear witness. He seeks to introduce all who join the church into some field of benevolent labor, and relies as far as possible on spiritual influences in the various fields of Christian action opened by the church, so to develop every man in the Christian life that he shall be a law unto himself, and not need constant legal scrutiny. Is not this right? Does not Paul say that a righteous man ought to be above such need of law? (1 Tim. i. 9.) Such a need of law indicates the childhood of divine life, and not the mature and fully-developed Christian. But when these means will not avail, the pastor does advocate judicial proceedings, and, if need be, excommunication.

But it may be said he makes it easy to leave the church. He does; and in this differs from those who, by a stringent covenant, make it impossible to get out of the church except by excommunication or death. Excommunication requires judicial proceedings, and thus the difficulty of getting a member out of the church is raised to the highest point. The tendency of this system is to retain in the church many who should be out of it, yet cannot be put out by judicial processes. The pastor regards this stringent system as unauthorized by the Bible and injurious, and opens the door for those to withdraw who, in Christian judgment, ought to be out of the church.

Is not this wise? Does it not tend to purity in the church? True, it may not remove all who ought to be removed, but it is a step towards it. Every one who has had a wide experience of churches knows how hard it is to get out unworthy members by judicial processes after they have been once received. But the policy of the pastor tends towards the purity of the church, as far as it goes, and therefore deserves decided approval and not censure.

To conclude, the avowed end of Plymouth Church, and of the pastor, is to promote holy living to the highest degree, and their whole system is deliberately adapted to that end. If all unworthy members are not removed, it is because there is no known process by which it can be effected in this world. That such would be the fact our Saviour foresaw, and referred us to the final judgment-day for the complete removal of all of the elements of evil from his church. EDWARD BEECHER.

THE VIRGINIUS CASE.

TO THE EDITOR OF THE NATION:

In your number of Dec. 11, I read the following words:

"The theory . . . that if the *Virginius* was a mere pirate we might not be able to call Spain to account for her summary mode of dealing with the crew, receives a severe blow from the following article of the Treaty of 1795 between that country and the United States: 'Art. VII. It is agreed that the subjects or citizens of each of the contracting parties, their vessels, or effects, shall not be liable to any embargo or detention on the part of the other, for any military expedition, or for any public or private purpose whatever.'" [The rest of the article, which has no bearing on what I wish to say, is omitted.]

Now, I wish to submit:

First, That what is meant here is the *embargo or detention*—the latter word defines the first—*of vessels already in port*. There is no embargo of any others. The article prohibits the exercise of what is sometimes called the *jus angariæ* and all other summary ways of treating vessels in port.

Secondly, if the *Virginius* were "a mere pirate," and thus the vessel of *hostes humani generis*, the ship of any nationality could have seized her, and the courts of any nationality tried her. Can you believe that the United States, in this article, renounced the right of seizing a Spanish piratical ship on the high seas? Being seized, such a vessel would come before our courts like any other similar vessel, and be tried and condemned. All her crew, of every nationality, would be equally amenable to our laws, as waging war against us. To this case surely *embargo* and *detention*, and subsequent treatment of persons on the piratical ship, could not be supposed to apply. W.

[The passage which "W." omits contains, however, the basis of our suggestion, viz.: that "in all cases of seizure, detention, or arrest, for debts contracted or *offences committed* by any citizen or subject of one party within the jurisdiction of the other, the same shall be made and prosecuted by order and authority of the law only, and according to the order of procedure usual in such cases. The citizen, etc., shall be allowed to employ such advocates, solicitors, notaries, agents, and factors as they may judge proper in all their affairs and in all their trials of law in which they may be concerned before the tribunals of the other party; and such agents shall have free access to be present at the proceedings in such causes, and at the taking of all examinations and evidence which may be exhibited in the said trials." It is not unreasonable, we think, to hold that American citizens, charged with piracy before Spanish tribunals of whatever nature, are entitled to the benefit of this provision, and it is certain that in the *Virginius* case they were deprived of it. The consul was denied access to them, and they had no assistance from agent, solicitor, or advocate. To "W.'s" interpretation of the treaty regarding embargo and detention we have no exception to make.—ED. NATION.]

Notes.

ON Tuesday and Wednesday, January 27, 28, Messrs. Puttick & Simpson, 47 Leicester Square, London, W.C., will sell at auction the books and pamphlets collected by the late John Camden Hotten, and relating chiefly to North and South America. It is not a very remarkable collection, though book-buyers of a great variety of tastes will doubtless find it to contain something necessary to their perfect happiness. There are several works from Franklin's press, and a unique copy of his 'Dissertation on Liberty and Necessity, Pleasure and Pain,' an octavo pamphlet of 32 pages, printed in London in 1725, which the author sought to suppress in his maturer years. It is numbered 274 in the catalogue. Mr. Hotten's collections of engravings and portraits; of ancient charters, deeds, and MSS. relating to English county families; and of autographs of eminent personages, will be sold by the same auctioneers at a later date.——We learn from the *Athenæum* that Macmillan & Co. will publish in the spring an account of Sir Samuel (Pasha) Baker's recent expedition to the Upper Nile, in two volumes. Also, that in May will appear a work on Central Asia, by Mr. Eugene Schuyler, who is perhaps reserving for it a reply to Prof. Vámbéry's rejoinder to his recent attack on that gentleman's good faith as a traveller and an author. One would naturally ex-

pect him at least to take some notice of Vámbéry's defence of his philological integrity.——The proprietors of the London *Vanity Fair*, which "there is no presumption in saying has been adopted as the special paper of good society," inform the public further that it has now been established on a very solid and permanent foundation; that from the 1st of January it will be considerably enlarged in size, and will have several new features introduced into it; that the weekly cartoons will be printed in an entirely new style of chromo-lithography, and on better paper; and that the annual subscription price will be raised to two guineas and a half. But the best announcement of all is that Mr. Pellegrini ("Ape" of the early cartoons) will hereafter be the exclusive artist of the paper—a permanent engagement having been made with him. The *Vanity Fair* gallery of statesmen, sovereigns, and other eminent personages includes now nearly two hundred portrait-caricatures. ——Mr. J. T. Trowbridge, hitherto the editor of *Our Young Folks*, informs its readers that he will transfer to *St. Nicholas* a serial story prepared for the former magazine. With three such admirable story-tellers for children as Mrs. Dodge (the editor), Mr. F. B. Stockton, and Mr. Trowbridge, *St. Nicholas* makes a strong beginning and can hardly fail to meet with general acceptance.——*Petermann's Mittheilungen* for October 28 offers a map of Southeastern Australia, showing the latest discoveries up to the present year, and also, by appropriate coloring, the distribution of population. Another map is of the rapids of the Madeira River, and marks the line of Col. Church's projected railway around them, one of the most important enterprises of the day. The *Polaris* expedition and the Khivan campaign are among the subjects discussed in the text.——Prof. W. D. Whitney contributes to the *College Courant* (New Haven) for December 13 an article on "Text-Books for the Study of Sanskrit," to which we would call the attention of all intending students of the language. He has been led to write it, he says, in consequence of the numerous letters of enquiry which he is constantly receiving, the writers being, "in great part, men advanced in life, or at least settled, as instructors or professional men, away from institutions where the study is taught, and where helps for it are to be found." Prof. Whitney furnishes the beginner all the aid possible in the selection of text-books and dictionaries, though he is obliged to confess at almost every turn that they are scanty, difficult to obtain, and defective.——To the gift-books noticed last week we must add the elegant work imported by Scribner, Welford & Armstrong, entitled 'History of the Ceramic Art,' and translated from the French of Albert Jacquemart by Mrs. Bury Palliser. It is illustrated by twelve exquisite etchings on steel by Jules Jacquemart; by 200 wood engravings, partly by the same hand; and by monograms, marks, etc. We shall endeavor to give critical attention to this work hereafter. Though especially attractive to collectors of pottery and porcelain, it will give pleasure to any lover of the beautiful. We should also indicate to Christmas buyers Mrs. Kate N. Doggett's translation of Charles Blanc's 'Grammar of Painting and Engraving,' published, in the best manner of the Riverside Press, by Hurd & Houghton; and Mrs. Clement's 'Hand-book of Painters, Sculptors, Architects, and Engravers,' published by the same house.

—The American Palestine Exploration Society has published a 'Second Statement,' bearing date of September. It contains an account of the efforts made by the Society to organize an exploring party, and of the difficulties encountered by Lieut. Steever and his associates in taking the field after their arrival at Beirut. The most serious obstacle was of course the want of money; and, "at last, the officers of the Society made themselves personally responsible for the letters of credit (for two thousand pounds) which, in March, opened the way to Moab. Nearly one-half of this sum, we regret to say, still remains to be raised." A letter from Lieut. Steever, dated March 29, narrates the adventures and observations of his command during the march from Beirut to Es Salt, across the Jordan. Subsequent despatches bring down the record to the end of August, but they are yet to be published. Prof. Paine believes "that he has fully identified the heights of Nebo and Pisgah." The rest of the 'Statement' consists of interesting papers on kindred topics; the first on "Discoveries at Nahr-el-Kelb" (the river Lycus of Strabo and Pliny), also made by Prof. Paine, and described in his own words. These relate to three archaic Greek inscriptions on the ancient road from the sea to Baalbec. The inferences drawn from them by Prof. Paine are decidedly shaken by Dr. Howard Crosby's critical queries at the close of the article. Mr. J. Augustus Johnson treats in the "Modern Canaanites" of a peculiar people inhabiting the mountains connecting Lebanon and Taurus; the Rev. Samuel Jessup contributes a light but interesting paper on "Husn Sulayman," with numerous illustrations of the general situation and antiquities of the place; and the Rev. Wm. Hayes Ward describes in a lucid manner the celebrated Hamath inscriptions, facsimiles of which accompany his article. Mr. Ward thinks the problem of deciphering these hieroglyphics is not very hopeful. The characters are not unique, however, being found on one or two badly preserved inscriptions in Aleppo, and on some gems from Babylonia in the British Museum.

—The recently published pamphlet containing the "Proceedings of the Fifth Annual Session of the American Philological Association," consists for the most part of abstracts of papers on the minutiae of linguistic science, and will, therefore, hardly be looked upon as "popular" literature. We find, however, on the 24th page, some facts which ought to interest the American people, especially if they have any respect for their aboriginal predecessors. These facts are furnished by Mr. Horatio Hale, of Clinton, Ontario, Canada, and therefore rest on excellent authority. Mr. Hale, in a visit to the Reserve of the Six Nations, near Brantford, procured a list of the founders of the celebrated Iroquois Confederacy, in which he found, to his surprise, the name of Hiawatha, the Indian hero "made famous by the genius of Longfellow," but in a form so disguised that he did not at first recognize it. Written according to the Mohawk pronunciation, on the Reserve, the name is "Ayunghwata"; but, taking the word as usually written, if we give to the first *a* a slightly nasal sound, like that of the French *an* or *en*, and separate the *t* and the *h*, we shall approach very closely to the correct pronunciation. The meaning of the word is "He who seeks the wampum belt." It appears from Mr. Hale's investigations that Hiawatha was not a myth, but a veritable personage, "as authentic as King Alfred or General Washington." He appears to have lived in the latter part of the fifteenth century. That part of his life of which the fullest account has been obtained has some romantic traits, not unlike Longfellow's hero. It was he who first conceived the idea of uniting the various tribes in a confederacy, and, with the aid of an influential Mohawk chief, named Tekanawita (sometimes written Deckanaweeda), succeeded in carrying it out. They held a convention, and planned a system of government somewhat in the style of the founders of our Republic. The names of those who took part in the convention are remembered, and even some recollection of their speeches is preserved by tradition. The motives of the leaders were much the same as those which actuated the framers of our Constitution, and their plan was a remarkably comprehensive one. Their purpose was not to confine the union to the tribes of their own stock, but to embrace in it all the tribes or "nations" known to them, so as to bring about a general and permanent peace. "It will seem almost incredible," Mr. Hale remarks, "that a convention of Indian sages and statesmen, actuated by these views, was held four centuries ago in Northern New York; and yet the evidence of it is very strong." There are still extant some of the songs composed at that time. They are held in recollection by means of strings of wampum, each string varying from the others in the collocation of the beads, and every string recalling a verse. The verses are in an archaic dialect, which differs from that of the present day about as much as the language of Chaucer differs from modern English. These songs are in praise of the confederacy, and are still chanted whenever a new chief is installed.

—Mr. Hale, who communicates the above facts, became favorably known to etymologists more than twenty years ago through his work on the 'Ethnography and Philology of the Wilkes Exploring Expedition,' which is a marvellous storehouse of materials for the use of scientific students. Although he has published but little besides this book, he has not been idle in his chosen field. In his successive visits to the Reserve near Brantford, Canada, he has collected valuable vocabularies of Indian languages and dialects, and made some important discoveries, which will probably be published ere long in a permanent form. His "Exploring Expedition" Report, which has long been out of print, is to be republished, with the permission of the Government, in a cheaper and more convenient edition. The Philological Association, whose opinion ought to be of some value in such a case, welcomed the work in advance of its reappearance by a warmly commendatory resolution passed at their last session, held at Easton, Pennsylvania.

—Mr. Bryce's 'Holy Roman Empire' has reached a new edition—we believe the fourth. To those already familiar with this work, as well as to future readers, we can recommend Dr. Carl Wolff's elaborate monograph on the territorial divisions of the Empire, which has just been published in Berlin (Carl Habel), and the already issued illustrative map. The German title of the former is 'Die unmittelbaren Theile des ehemaligen römisch-deutschen Kaiserreiches und ihrer früheren und gegenwärtigen Verbindung.' The author takes up successively the ten *Kreise* into which the Empire was divided, and follows them into all their numerous subdivisions, giving the situation, boundaries, title, arms, etc., of each fragment of territory, and its varying fortunes through all the changes in the map of Europe from 1521 down to 1870, or to the foundation of the new Empire. Dr. Wolff's Introduction will also prove a useful supplement to Mr. Bryce's general view. After a slight sketch of the rise and decay of the Empire, it presents a very clear summary of the organization of the Empire from the Peace of Westphalia to its ultimate extinction—the power and attributes of the emperor,

the elective body, the composition of the Reichstage, the imperial courts, the imperial revenues, the army, etc., etc. The index of places, in triple columns, occupies fifty pages, and facilitates reference to any given district, town, or city.

—The Cotta editions of Goethe's works wrongly print as his an essay with the title, "Die Herstellung des Strassburger Münsters" ('Sämmtliche Werke, Stuttgart and Tübingen,' 5 Bde., 1854-55, V. 409-411; 'Werke: Vollständige Ausgabe letzter Hand,' 60 Bde., 1827-42, XXXIX. 364-373). The essay, with remarks at the close on the Cologne Cathedral and other antiquities, was published originally in Goethe's 'Kunst und Alterthum,' and communicated by Sulpiz Boisserée. It was Boisserée's intention to furnish Goethe only with materials for an essay, but Goethe said that the article could not be improved, and published it as it was written. He appended, however, the initials "S. B.," but these, by an error, were omitted in the printing, and the essay, very naturally, has been considered Goethe's own. Anton Springer makes the correction in No. 27 of *Im neuen Reich*. Boisserée often, in conversation with Springer, claimed the essay, and his published correspondence with Goethe gives Goethe's explanation of the mistake. Readers of W. Rossmann's 'Vom Gestade der Cyclopen und Sirenen,' or those who know the *Academy's* mention of the work as a meritorious book of travels, will like to hear of a visit which Herr Rossmann made last year to Argos and the plain of Mycenæ. "Eine Wallfahrt ins Land der Heroen," as his articles are entitled (*Im neuen Reich*, Nos. 28 and 29), naturally says much of the importance of the House of Pelops to the Attic tragedians; its chief interest, however, is for the student of sculpture and the antiquarian. It gives probably as good an account as can be found of the design over the Lion-gate at Mycenæ. Lübke's 'History of Sculpture' has a wood-cut of the ornament, but is far from indicating the place which it holds in the history of the art. All copies of the relief, except those modelled after the Berlin plaster-cast, are inaccurate; even the Berlin cast fails by isolating the relief. Of equal interest in the history of Herder's intellectual development with other articles, wanting in the editions of his writings and made known by Dr. Suphan, is his review of the literary products of Germany for the year 1773. The review was written in Herder's Bückeburg period, and contributed at the request of his friend Hamann to the *Königsberg Literary-Political Journal*, of which Hamann was editor. The fact is noteworthy that the review, aside from being the product of a turning-point in Herder's spiritual and literary development, is taken from probably the only copy of the volume of the *Journal* for 1774 in existence. In its critical judgments, the essay shows the influence of Lavater. It is written in a somewhat abrupt and disjointed style, and has been republished with judicious comments by R. Haym in No. 40 of *Im neuen Reich*. The essay takes up about eight and a half pages, and Haym's remarks six. Dr. Suphan has had a critical edition of Herder's works a long time in contemplation, and has frequently called attention to little-known writings of Herder, especially in contributions to the *Zeitschrift für deutsche Philologie*.

—A dispatch by Nicolo di Favri, of Treviso (attached to the Venetian Embassy in London), to Francesco Gradenigo, son-in-law of Andrea Badoer, the ambassador of the Republic to King Henry VIII., dated London, 23d January, 1513, and received at Venice in February, is a document of singular interest, illustrating the English manners of the sixteenth century more minutely than any similar source with which we are familiar. We shall quote throughout Mr. Rawdon Brown's abridgment in his 'Calendar of State Papers and MSS. existing in the Archives and Collections of Venice':

"In England, the houses are all of wood, and both rooms and corridors are of the same material. Over the floor they strew weeds, called rushes, which resemble reeds, and which grow on the water. Every eight or ten days they put down a fresh layer, the cost of each layer being half a Venetian livre, more or less, according to the size of the house. In England, the women go to market for household provisions; if gentlewomen, they are preceded by two men-servants. Their usual vesture is a cloth petticoat over the shift, lined with gray squirrel's or some other fur; over the petticoat they wear a long gown lined with some choice fur. The gentlewomen carry the train of their gown under the arm; the commonalty pin it behind or before, or at one side. The sleeves of the gowns sit as close as possible; are long and unslashed throughout, the cuffs being lined with some choice fur. Their head-gear is of various sorts of velvet, cap fashion, with lappets (*coste*) hanging down behind over their shoulders like two hoods; and in front they have two others, lined with some other silk. Their hair is not seen, so is unable to say whether it be light or dark. Others wear on their heads muslins, which are distended, and hang at their backs, but not far down. Some draw their hair from under a kerchief, and wear over the hair a cap for the most part white, round, and seemly. Others again wear a kerchief in folds on the head; but be the fashion as it may, the hair is never seen. Their stockings are black, and their shoes doubly soled, of various colors, but no one wears 'choppines,' as they are not in use in England. [The chopine was a shoe with a heel over three inches in depth.] When they meet friends in the street, they shake hands, and kiss on the mouth, and go to some tavern to regale, their relatives not taking this amiss, as such is the custom. The women are very beautiful and good-tempered. The men are well-made, tall, and stout; well-clad, wearing gowns called doublets (*zuboni*), plaited on the shoulders, reaching halfway down the leg, and lined with several sorts of very fine furs. On their heads they wear caps with one or two ornaments (*una foza over con do*); with short hair like the priests in Venice, the hair over the forehead being cut away. In England, no one makes bread at home; but every morning all take it at the bakers', and keep tallies there (*tessera*); at present bread is dear, on account of the war. The price of meat has more than doubled, as a 'milizia' [probably meant for migliaja or thousands (of oxen)] has been salted for the army, and very great preparation is making to stand the brunt; and by day and night and on all the festivals the cannon-founders are at work. [The invasion of France was to be undertaken by England and Spain.] The Venetian ambassador is at great expense, as he daily receives visits from one nobleman or another, most especially now that the Parliament is sitting. The floors of the English houses are for the most part planked. Aloft at the window-sills (which are all of wood) they put rosemary (*osmarin*), sage, and other herbs. In England, it is always windy, and, however warm the weather, the natives invariably wear furs. At present it has not yet been cold there, nor is it rainy or muddy. The summers are never very hot, neither is it ever very cold."

—The succeeding paragraphs concern the martial preparations of the king. Presently the writer turns again to civil matters:

"On All Saints' Day the Parliament met. All the lords of the kingdom came; the Parliament being held in the king's palace at a place less than two miles from London, called Westminster, where all the nobility who come for the session have houses. They attend the Parliament every morning, and having thus to pass the door of the Venetian ambassador's house on the Thames, whether they go by land or water (there being a hundred boats, built in the fashion of the country, which ply between London and Westminster), they visit him. This custom is by reason of the love they bear him. They come each with sixteen servants, more or less; some to dinner, others to breakfast; and thus, according to the custom of the country, is breakfast served every morning. The ambassador is always very glad to see them, and everybody likes him, from the highest to the lowest; indeed, were he a peer of the realm, the king and the nobility could not love him more cordially than they do. This is owing to his mature age, and because he is as conversant with the manners and language of England as if born in the country. Some of the English noblemen have said that he rather than any other envoy is needed in England to effect the rupture with France; and when they knew that another ambassador was coming, they said the Signory did ill to change. The ambassador [Badoer] wishes to return home, as he has hard work. Every morning at daybreak he goes to mass arm-in-arm with some English noblemen, and, after walking up and down for an hour, they attend the council, and then he returns home. Scarcely is he within doors ere some nobleman comes to visit him, and if he is from home his visitors wait for him, and refreshments are served. The ambassador is always prepared, and has six sorts of wines, some paid for, others taken on credit, for he has no money, though his credit is good. He has pawned his plate, sold his gowns, but still remains much in debt. Were this fact known to the Signory, they would supply him with funds for his maintenance. The ambassador's house is half a mile from Westminster, a very fitting site, as the Lords of the Court live thereabouts, and an ambassador ought not to trade, but merely learn what is doing at the Court. The ambassador sleeps scarce two hours in the night; he goes late to bed, and rises early. . . . A tax of a tenth has been levied throughout the kingdom. The lords and great personages (*gran mistri*) pay according to their property; tradesmen, servants, and attendants one penny per head, equal to twenty-eight Venetian 'piccoli.' This tax will yield a million of gold, so that the king means to make war. The king is a young man of three-and-twenty; when he moves, the ground shakes under him; is well-made, tall, and stout, and very fond of the Venetian ambassador, whom he chooses to accompany him, so that the ambassador requires money for his outfit."

The letter concludes with reports of four great victories by the Spaniards over the French. It was evidently written for the Signory to peruse, for with all the familiar revelations in its earlier topics, the stinginess and mean economy of the Doge and Senate towards their representative are harped upon in the allusion to the ambassador's frequent and unavoidable expenses. Andrea Badoer was always short of funds, and, towards the close of his mission, was forced to write direct begging-letters to his masters for very food and clothing, and it was only with great difficulty that he finally obtained a sum sufficient to discharge his debts in London. The calendar edited by Mr. Rawdon Brown is throughout a valuable compilation for the student of history of the Tudor period. The ceremonies, fêtes, and receptions, as well as the public events, are narrated with a striking detail of information not to be found in any mere chronicle or memorial. Of the genuineness and authenticity of the documents there never, as Mr. Brown himself testifies, has been entertained the slightest doubt.

HOLLAND HOUSE.*

THERE are probably few visitors to London possessing any familiarity with English literature or politics who have not taken occasion to get at least a glimpse of Holland House from the Kensington Road. Even those who know nothing of its historic associations are struck by the look of peace and dignity and splendor which the noble old pile presents, as they come

* 'Holland House. By Princess Marie Liechtenstein.' Two vols. London and New York: Macmillan & Co. 1874.

upon it in the midst of the dreary wilderness of London brick, and embowered in its great trees. It is now the most famous dwelling-house in London, and perhaps *the* one the destruction of which by the march of "modern improvements" persons of taste would witness with most regret. How it came to be famous all readers of Macaulay's Essays know. A successful political adventurer, named Stephen Fox, who rose into royal favor after the Restoration, left a son, the first Lord Holland, who began life both needy and unscrupulous, made a large fortune, it was universally believed by foul means, as paymaster-general of the forces, and left four sons, one of whom was Charles James Fox, the orator; and the eldest, who died young, left Holland House to *his* son, the third Lord Holland, who gave it its celebrity. He was born in 1773, and died in 1840, so that his manhood covered one of the most interesting periods of English history, and that most fertile in great men and most crowded with great social and political movements. It produced the French Revolution and Empire, and the gigantic wars which accompanied them, the rise of the English middle-class into power, and the overthrow of the oligarchy, and the appearance of the modern novel, of the quarterly review, of monthly magazines, the newspaper, and of Byron and the Lake poets. In fact, no period of English history has been marked by so much social and literary brilliance. London society has at no time included so many famous or remarkable men, and it was still small enough for individuals to preserve their weight in it. Lord Holland found himself at the opening of this period with considerable culture, great charms of manner, great powers of conversation, and a mind which, if not of the highest order, was strong enough to stimulate all who came into contact with it, and, above all, with a brilliant and accomplished wife, in possession of one of the most attractive houses in England, surrounded by beautiful grounds, within a mile or two of the Houses of Parliament; and, during the remainder of his life, he and Lady Holland made it a resort which not only all the leading politicians of the Liberal school, but the greatest English wits, orators, poets, painters, were delighted to frequent, and remembered to their death as the scene of their most delightful hours. Macaulay's pathetic picture of the library in its best days is fresh in everybody's memory, and probably nobody has ever read it without an eager desire to know something more of the old mansion, described so briefly in his impassioned and well-balanced periods.

The Princess Marie Liechtenstein, an adopted daughter of the present Lady Holland, who was brought up in Holland House, and was recently married to a younger son of the great Austrian house of Liechtenstein, has sought to gratify this desire in the two handsome volumes before us. The book is mainly valuable, however, for its engravings. To the reminiscences of Holland House she has added little that was not already known. She gives a list of habitués of the place in its best days, which, however, is enough to make one sigh on thinking that no faithful Boswell was attached to the dining-room and drawing-room, to collect all crumbs of conversations which must have surpassed in interest anything the past two centuries has produced. The circle was bounded by no narrow lines of party, or creed, or pursuit, or nationality. Everybody was welcome who had distinguished himself, or was likely to do so. What other hostess that modern society has produced could say that men like these had sat at her table? Sir Philip Francis, the reputed author of 'Junius'; Dr. Parr; Lord Byron; Lord Jeffrey; Monk Lewis; Payne Knight, the scholar and antiquary: Dumont, the publicist; Thurlow, Eldon, Brougham, and Lyndhurst, the four great Chancellors; Sir Humphry Davy; Count Rumford; John Hookham Frere; Lord Macartney, of the Chinese Embassy; Charles James Fox; Henry Grattan; Windham, the great orator; Sir Samuel Romilly; James Monroe; Washington Irving; Pozzo di Borgo; Montholon and Bertrand, the faithful attendants of the first Napoleon; Lally Tollendal; the two Humboldts; the Duc d'Orléans, afterwards Louis Philippe; Prince Metternich; Canova, the sculptor; Tom Moore; Erskine; Banister and Kemble, the actors; Madame de Staël. We have omitted here all those less widely known. In fact, as the authoress says, "from 1799 to 1840 there was hardly in England a distinguished man in politics, science, or literature who had not been a guest at Holland House. Beginning the list with C. J. Fox and Lewis, and ending it with Lord John Russell, Lord Melbourne, and Monckton Milnes, now Lord Houghton, we shall have a goodly company in a net." And behind the general company of the salon, there was an inner circle, no less delightful, which contained Sydney Smith, Rogers the poet, Luttrell the wit, and Francis Horner, of whom Smith said, "the Ten Commandments were written on his face," and of whom Lord Campbell said, "that he was the first man who ever made the doctrines of political economy intelligible to the House of Commons"; and Brougham, in his best days; and Mackintosh, and Macaulay, and many, many others.

Few of the Princess Marie's anecdotes are new; but one or two will perhaps bear quoting. Mackintosh annoyed old Dr. Parr by calling O'Coigly, who was tried for high treason in 1794, "a rascal," and the Doctor replied, "Yet, Jimmy, he might have been worse; he was an Irishman, and he might have been a Scotchman; he was a priest, and he might have been a lawyer; he was a rebel, and he might have been an apostate," alluding to Mackintosh's early beginnings as a defender of the French Revolution. Luttrell was one day, when there was an unexpected addition to the dinner-party, told by Lady Holland that "he must make room." "It will have to be made," he said; "for it does not exist." Lady Holland ruled the brilliant throng with a rod of iron. She was beautiful, clever, well-read, and full of kindliness, but arbitrary power had spoilt her, and she became rather remarkable for her brusquerie and imperiousness. She has been known to stop Macaulay in the midst of an interesting anecdote with "Now, Macaulay, we have had enough of this; give us something else." Sydney Smith she ordered about without much consideration. Telling him one day in stern tones to ring the bell, he did so meekly, and then asked "whether he should sweep the room." Hearing that Tom Moore was writing about the life of Sheridan, which *he* expected to be lively and amusing, she remarked to him in full dinner-table, "This will be a dull book of yours, this 'Sheridan,' I fear." Sometimes she met her match, as in Talleyrand, who observed, on hearing some one ask why she dined as early as six, that "he supposed it was to inconvenience everybody." Seeing some politicians whispering together in the drawing-room one evening—"Ah, gentleman," he said, "you're whispering; we shall have to go to the club to find out what you're saying."

Lord Holland died, as we have said, in 1840, and all this brilliant society came to an end. Many of its lights had preceded him; a few, such as Sydney Smith and Macaulay, survived him a short time; but Holland House ceased to be the charmed spot to which for so many years so many willing feet were turned. His son lived until 1859, and the widow of the latter still occupies the old mansion. London society has, however, changed too much for any one woman to fill the place in it occupied by the third Lady Holland, and English literary and political life has grown too vast and various in volume to make any revival of the glories of Holland House possible.

MIRABEAU.*

MIRABEAU'S career is one of the puzzles of history. American or English readers are too little acquainted with the bare facts of his life to understand fully the problems which it presents. They know Mirabeau merely as a great speaker, and the author of two or three celebrated Revolutionary mots. They further know that letters published since his death have proved him to have been in the pay of the court at a time when he was supposed to be the leader of the Revolution. These facts excite the reprobation without exciting the astonishment of English critics. They are, in the first place, prone to believe that all the heroes of the Revolution were monsters whose characters combined all the worst traits of human nature. They know, in the second place, that speakers have often been venal, and see no great reason for wondering at the corruption of a democratic rhetorician. They content themselves with enquiring, like Mr. Senior, whether the discovery of Mirabeau's treachery has excited much surprise in France, or think that Macaulay's description of the greatest of French orators as a 'Wilkes-Chatham" will suffice to explain the extraordinary character of the greatest statesman produced by the Revolution. For even the peculiarity of Mirabeau's conduct cannot be recognized until the plain historical fact be admitted, that he was even at the opening of the States-General nearly the most conspicuous statesman, and certainly the most influential popular leader, of the time. Elected both at Aix and Marseilles in opposition to all the influence of the nobility, he exerted a kind of power in the south of France something like the moral authority exercised by O'Connell in Ireland at the very height of his fame. Demonstrations of popular violence which the Government could not control were more than once calmed and kept within due limits by the exercise of Mirabeau's authority. He was not an unknown man whom the accidents of the time had forced into prominence, but was a politician, the vicissitudes of whose life, combined with his extraordinary talents, had kept him before both the court and the people as a man certain to exert immense weight in the conflicts of the day. Whatever other mistakes the French made, they committed no error in believing Mirabeau to be a statesman, and a statesman of the highest class. Before the Revolution broke out, he had denounced with singular boldness the evils against which that movement was directed. He had written from a dungeon against *lettres de cachet;* he had devoted himself when in prison to the defence of a poor man, unjustly attacked by the Government officials; he had appeared

* 'Mirabeau et la Constituante. Par Hermile Reynald. Ouvrage couronné par l'Académie française. Deuxième édition.' Paris: Didier et Cie.
'Mirabeau, sa vie, ses opinions et ses discours. Par A. Vermorel.' Paris: Librairie de la Bibliothèque Nationale.

as protector of the patriots of Holland, and had, whether fighting his own battles or fighting the battles of others, constantly come forward as the assailant of despotism and bigotry. Of his statesmanlike insight the court itself must have had a high opinion, from his employment in a delicate diplomatic mission to Prussia; and modern students, who have before them his speeches, his memoirs, and his most private notes, can form even a higher impression of his sagacity than could his contemporaries. On more points than we have space even to enumerate, he showed a clear-sightedness which is almost miraculous in a man of his time, and is, unfortunately, after all the lessons of experience, hardly to be found in the Frenchmen of to-day. He, for example, was the first to point out that the best mode of disarming an opposition was to take their leaders into power. His maxim, "A ministry of Jacobins will not be a Jacobin ministry," is shown to be true by every line of English history, but is a paradox which has never yet been intelligible to any French political party. He, again, saw the full importance of allowing ministers to sit in the Assembly; and if his advice had been listened to, the Assembly, naturally enough misled by one of the features of our American Constitution, would have entered on the right course for founding a constitutional government, and would have avoided one, at any rate, of the rocks on which the Revolution made shipwreck. He saw, again, what every one can see now, but what was apparently hidden from the eyes of the generation among whom he moved, that the Revolution, though essentially opposed to the privileges of the aristocracy, was not in its essence inconsistent with the maintenance of a strong central power. "One part," he wrote, "and that the most considerable part, of the labors of the National Assembly is evidently most favorable to a monarchical government. Is it nothing to be rid of parliaments, of *pays d'état*, of corporations such as the clergy, the privileged classes, or the nobility? The idea of forming but one class of citizens would have pleased Richelieu. If this smooth surface suits liberty, it also facilitates the exercise of authority." This insight is seen further in his views as to the royal veto, the right of declaring war, the impossibility of restoring aristocratic privilege, and in all the discussions in which he took part. The superiority and real peculiarity of his genius are summed up in his contempt for words and respect for facts. "People," he writes, "are irritated that I am always for moderate courses, but I am so convinced that there is an untold difference between making a fancy journey on a map and a real journey over the world; I am so certain that my constituents care very little about our metaphysical discussions, however important they may be, and that we can only count on their support when it comes to a matter of bread and cheese; I am so sure that the best way to make the Revolution fail is to ask too much, that I shall for a long time deserve the honorable reproach of moderation."

The man who could write thus when all Europe was excited about the metaphysics of politics was at any rate no declaimer, but a statesman such as France needed in '89, and does not apparently possess in 1873. His career as a politician extended only over two years, *i.e.*, from the meeting of the Assembly on the 4th of May, 1789, to his death on April 2, 1791, and was, as far as his open acts were concerned, worthy of his reputation. His boldness gave spirit to the Assembly to resist the court. His sagacity constantly directed it into the path of sound policy. His vigorous assertion of unpopular measures—as, for example, in upholding the veto—if it offended fanatics and excited the suspicions of enemies, seemed to give a guarantee of his fearless independence. Many even of the facts which roused against him the charge of treachery are capable of being interpreted as signs of prudence and moderation. His endeavors to effect a union, first with Necker, then with Lafayette, his resolute opposition to the violence of the mob, and to the fanaticism of the Jacobins, whose "thirty voices" he silenced by his thunders, even his communications with the court, which were at any rate suspected by his contemporaries, are in themselves to modern readers rather the signs of patriotic prudence than of political treachery. No doubt his course, even looked at without reference to the information with which the correspondence with La Marck has furnished us, appears at times strangely devious. But a politician must turn and tack during the storms of a revolution, and a leader who pilots the vessel of state is easily pardoned any variations in his course if he is supposed to be intent upon guiding her into port. In spite of suspicions, in spite of denunciations, the French people almost believed at the moment of Mirabeau's death that the country had lost a true patriot. The court, the Assembly, the people, and the Jacobins, with one accord paid him honor. The chorus of lamentation and veneration which accompanied his funeral was broken only by a shriek of hatred from Marat, who denounced the popular hero as a traitor, and, in a spirit of a kind of psychical prophecy, foretold that his bones and Mirabeau's should never rest together in the same pantheon. Marat's execrations seemed at the time an honor due to Mirabeau's greatness, and they were probably the result not of insight but of that insane suspicion which led Marat to denounce to public odium every man who committed the unpardonable crime of exciting his envy. Yet, in this instance, Marat's admirers, if any such he still possess, may claim for him second-sight.

In 1861, La Marck's correspondence with Mirabeau was published to the world, which then discovered for certain, what even Mirabeau's bitterest foes had only suspected, that the great democrat, statesman, and patriot had, at the very time when he was receiving the homage of the nation, pocketed the bribes of the court. His venality, it is true, had for years been more than suspected, but La Marck gives the whole details of the transactions between Mirabeau and the court, and the exact terms on which the bargain between them was struck. His debts were paid, he received an allowance of 6,000 francs a month, and was promised a million of francs after the session of the Assembly if the court were satisfied with his conduct. "This," says Quinet, "was the price at which the finest genius of his age put himself up for sale." At first sight, Mirabeau's conduct appears even more incredible than it is base. A reader feels as he would feel if he suddenly discovered that Washington had been throughout his career in the pay of George III., that Cavour had accepted bribes from Austria, or that Bismarck had gained relief from pecuniary difficulties by accepting gifts from Louis Napoleon. Parallels may no doubt be found to the venality of Mirabeau in the tales told of Marlborough, but these stories, true or false, have always themselves seemed to require some explanation, and are, moreover, told of a general who was one of a body of politicians corrupted by a whole age of revolutions. We accept their venality as we accept the corruption and sycophancy of men such as Cambacérès, Sieyès, or Talleyrand, whose hopes and principles had been worn out by a succession of revolutionary changes. But Mirabeau came at the beginning, not at the end, of a great movement, and played the traitor at a time not of despair and corruption, but of passionate hopefulness and of moral exaltation. The mass of French writers have done little to explain the enigmas of Mirabeau's conduct. Whether Republicans, Moderates, or Royalists, they have regarded him with hatred, and, moreover, have displayed their ingenuity rather in the congenial task of turning epigrams and balancing antitheses, than in calmly investigating the true position and policy of a man whom no party could claim as their leader, and whose talents were as undeniable as his vices. The result of their criticism is best summed up in Quinet's dictum: "The first apostle of the Revolution was also its Judas." Gradually, however, a conviction is spreading that antitheses, however brilliant, can never afford a satisfactory explanation of any man's character, and, least of all, of the character of a man of genius. Such a man may be a hero or a villain, but he certainly cannot be a sort of double being, one side of whose soul is all darkness, and the other side all light. To himself he must seem to have some consistency, and of no person is this more certainly true than of Mirabeau. His last thoughts were of his fame, and, in a celebrated passage of his writings, he expressed shortly before his death the confidence with which he committed his reputation to time. His trust, moreover, in the judgment of posterity did not depend on the belief that he could dupe future ages by concealing the baser actions of his life.

His letters to La Marck are the main proof of his intrigues. Not only might he have destroyed these letters, and entirely omitted to do so, but he expressed great anxiety that they should be preserved, and grounded on the knowledge which future ages would possess of their contents his trust that time would do justice to his character. This confidence adds at first sight the last touch of perplexity to the enigma of his character, yet it is from his view of his own position that any one must start who seeks not to defend, for this is impossible, but to explain his conduct and motives. Time is, in a sense, fulfilling the great orator's expectations. The hatreds as well as the idolatries of the Revolution are losing something of their force. Year by year facts are becoming known which could be very imperfectly known or understood at the time they took place, and at last men are beginning to attempt a calm estimate of Mirabeau's career. The two works to which we have referred at the bottom of this article are neither of them brilliant compositions, but they are both attempts to give a clear account of the known facts of his life. M. Vermorel is a decided, though not reckless apologist, and any onesidedness in his comments is corrected by profuse quotations from Mirabeau's own works. M. Reynald is wisely content to play the part neither of accuser nor eulogist, but to confine himself to the less showy but more important duties of a narrator. Take these works, together with Quinet's 'Essay on the Revolution,' which, despite its epigrammatic form, is one of the most philosophic treatises on the subject which has ever been produced, and you will find a clear account of all that is known of Mirabeau. This account does not remove great stains from his character, but it does, in our judgment, go far to explain his conduct; and if it shows him to have been in many respects a bad and certainly most unscrupulous statesman, it shows that he was at any rate a man, and not a fiend, and explains to a considerable extent why to himself he did not appear to be a traitor.

The explanation of Mirabeau's career, at least from his own point of view, is to be found in the consistency with which, through life, he conceived and clung to one line of policy. His one ruling idea seems to have been that the Revolution was not, at bottom, in any way hostile to the existence of a strong central government. He further held that both for the sake of the country and for the sake of the king it was essential that the king and the country should act together. The passages we have already cited give the key to his views. Class privileges of all kinds and arbitrary government were in his judgment doomed to destruction. In his most private notes, when he had been purchased by the court, he warns the king that a counter-revolution for the restoration of the old order of things was impossible. The maintenance of the royal power was, on the other hand, not only possible but most desirable. The object therefore of his policy was, that the conduct of the Revolution should be taken under the guidance of the king. His idea was that the king should act under the guidance of a modern Richelieu, destroy the privileges of the nobility, and secure at once the ends of the Revolution and the authority of the crown. He himself was, of course, to hold the place of Richelieu. This position might be attained in two ways: either by his coming into power as a minister, supported by the majority of the National Assembly, or by his being promoted to power by the court, and carrying out necessary reforms in spite of the opposition of the Assembly. His first efforts were directed to gaining power as, to use English expressions, the parliamentary leader of the majority. The Assembly by its incredible shortsightedness, in forbidding members to take office, made Mirabeau's designs of becoming a great parliamentary statesman impossible. Thereupon he turned to the court. But whether with the assistance of the Assembly or by the support of the king, he intended to carry out what in his eyes was the true policy of the Revolution. In carrying out this policy he was, however, from the first placed in a false position, from the fact that his connection with the court could not be avowed. The falseness of this position was greatly increased by the tendency to intrigue and to the use of corrupt means, which no admiration for his talents can disguise from any one to have been an essential part of Mirabeau's character. So far, however, as his mere political designs go, he may well enough stand side by side with statesmen such as Cavour or Bismarck. Each of these ministers pursued a great and patriotic object. Each of them was singularly unscrupulous as to the means by which the object was attained. If Cavour had died when he was bargaining for the invasion of Lombardy by France, if Bismarck had been struck down at the time when he had held out hopes to Louis Napoleon of cessions of German territory, each would have perished with a very dark and dubious reputation. Each no doubt bore the risk confiding in the knowledge of his patriotism. Mirabeau had probably a feeling somewhat like theirs when he appealed to time. His path was tortuous, but it would, he thought, be seen to lead to the greatness of France. His payment by the court may perhaps have appeared to him as the salary for good service. He may have held himself bribed but not really bought; since he meant to enforce his own policy on the court, to whom he hired himself as a servant rather than sold himself as a minion. These excuses are worthless, and show the really weak point of his character, that gross moral insensibility which prevented him from feeling that even a grand policy became degraded when it was made the means of paying his debts and providing for his self-indulgence. His position, however, though in this respect disgraceful, is intelligible. Quinet's comparison to Judas goes deeper than perhaps it was meant to go. Generations have perplexed themselves over the problem how it could happen that the greatest crime which history records was committed for the sake of thirty pieces of silver. Far-fetched ingenuity has suggested that the thirty pieces of silver were not the real temptation to treachery, and that the traitor had remoter objects than that of mere gain. With far more truth, it may be suspected that the million of francs was not the ultimate end of Mirabeau's dealings with the court. Unfortunately, in each case the bribe has branded and will brand the recipient with the eternal infamy of treachery.

South-Sea Idyls. By Charles Warren Stoddard. (Boston: James R. Osgood & Co. 1873.)—Mr. Stoddard is a humorist—a California humorist—and the reader is not with him under the necessity (as he is in some cases) of taking the humorist's own word for the fact; for these 'South-Sea Idyls' have a good deal of undeniable amusement in them. It is rather difficult to know exactly what more to say of the book, for what part of it is a record of adventure, and what part is mere fancy, or, indeed, whether Mr. Stoddard has ever been in the South Seas at all, is a pure matter of conjecture. It seems hardly possible to believe the story of Kána Aná, a beautiful South-Sea Island coffee-colored boy, with whom the author represents himself as "chumming," whom he afterwards brings away and tries to convert to civilization, but who is so far spoilt by civilization that on his return to the Southern Seas he finds himself *ennuyé*, and finally perishes pathetically and miserably. The story of the French brig *Mouette* is also of a somewhat doubtful character. The *Mouette*, "bound south into the Equatorial seas," had a good deal of rough weather from the first; day after day the winds increase, and at last a cyclone bursts upon her. She is thrown on her beam-ends, and begins to fill rapidly, but her masts being cut away, she rights herself and lies in the trough of the sea, rolling like a log. Gradually the gale subsides, but the hull of the brig is swept continually by a tremendous swell, and, strange to say, although the masts have been cut away, the men are "driven into the foretop cross-trees," and in the foretop cross-trees they rig a tent for shelter, and gather what few stores are left them from the wreck. There are a dozen of them in this tent altogether, and here they lie for three whole days in silence and despair. "When hunger had nearly driven them to madness, they were fed in an almost miraculous manner. Several enormous sharks had been swimming about the brig for some hours, and the hungry sailors were planning various projects for the capture of them. Tough as a shark is, they would willingly have risked life for a few raw mouthfuls of the same. Somehow, though the sea was still and the wind light, the brig gave a sudden lurch and dipped up one of the monsters, who was quite secure in the shallow aquarium between the gunwales. He was soon despatched, and divided equally among the crew." This is only the beginning of the ghastly tale of the *Mouette*, which we should say was rather a shockingly good parody of the literary sailor's yarn, did it not—foretop cross-trees, sharks, aquarium, and all—seem to be intended by the author as true. There is always something disagreeably jarring in the writing of a humorist who leaves you in doubt as to a great part of what he has written, whether what he is about is pathos or humor, or what it is, and this unpleasant doubt continually thrusts itself upon the reader of Mr. Stoddard's sketches. There is, besides this, another disagreeable effect produced by Mr. Stoddard's occasional lapses into very bad taste and very bad English. With a very good ear for style, he seems to write rather for the sake of the sound of the words than to produce an effect on the minds or hearts of his readers, and while it is true that he has a sense for finished, harmonious, and dainty prose, it would perhaps not be unfair to compare his finish to that which varnish gives a pine board rather than that which polish gives to the intrinsically pure and hard grain of a truly good wood. Carefully as Mr. Stoddard's sentences are constructed, and great pains as he takes to select the exact phrases which appear to echo the notes that are sounding in his brain, we have every now and then some piece of downright bad English, like his use of "the same" in the shark story we have just been quoting. Of course, he has us at a great disadvantage in this matter, for if we point to any particular passage in illustration of his occasional bad taste or bad English, his admirers may say in reply that it is his humor we are quarrelling with; that he knows just as well as we that the expression used is not English, but that it is part of the business of the humorist, and particularly the California humorist, to make us laugh by humorous distortions of the common tongue of Shakespeare and Milton; and that so far from showing our critical acumen by pointing out the errors in question, we have only shown our lamentable want of an appreciation of California humor. To this there is no reply, and so we may as well say simply that we have found the book, with all the drawbacks we have enumerated, amusing with a dreamy sort of amusement, which we suppose is the proper color for California humor to take upon itself in the tropics. We ought to say, however, that life in the Southern Seas is such a peculiarly non-moral life, that we cannot recommend 'South-Sea Idyls' as a book of an invigorating and purifying tone. The Southern Seas—as it used to be said of Paris—are not a good place for deacons.

The Spirit of the Laws. By M. de Secondat, Baron de Montesquieu. Translated from the French by Thomas Nugent, LL.D. A new edition, carefully revised. Two volumes. (Cincinnati: Robert Clarke & Co. 1873.)—Montesquieu no longer occupies the place among political writers he once did, but he will never cease to occupy a high place, for he was the first to open up the field of experimental politics, from which most of the reforms in government have during the last century been drawn. "Before Montesquieu," says Bentham, and truly, "a man who had a distant country given him to make laws for would have made short work of it. 'Name to me the people,' he would have said: 'Reach me down my Bible, and the business is done at once. The laws they have been used to, no matter what they are, mine shall supersede them; manners, they shall have mine, which are the best in nature; religion, they shall have mine too, which is all of it true, and the only one that is so.' Since Montesquieu, the number of documents a legislator would require is considerably enlarged. 'Send the people,' he will say, 'to me; lay open the whole tenor of their life and conversation; paint

to me the face and geography of the country; give me as close and minute a view as possible of their present laws, their manners, and their religion.'" If Montesquieu could have retained the influence which 'The Spirit of the Laws' won for him on its first appearance in France, and he had not been supplanted by Rousseau, there is little doubt the French Revolution, had it ever occurred, would have run a wholly different course; "the law of nature" and the "state of nature" and "natural rights" would never have exercised the malign influence which has so deeply troubled the stream of European politics since that period, and has set so many young gentlemen and ladies in this country distributing "republics" among all the nations of the earth. He had, it is true, many of the errors and illusions of an explorer. He was the first jurist to use the vast store of materials which the voyages and discoveries and conquests of the seventeenth and eighteenth centuries had placed at the disposal of sociologists, and he naturally made a great many mistakes and drew a great many false conclusions from them, but he is nevertheless the father of modern political philosophy, in the best and widest sense of that term, and nobody who is about to study politics philosophically could dispense with the study of him, even if he had not been in his day one of the ruling minds of the civilized world. Messrs. Clarke & Co. have reproduced him in a handsome edition of the standard translation, which renders the French of 1750 probably better than a more modern one could do.

Education Abroad, and Other Papers. By Birdsey Grant Northrop, LL.D., Secretary of the Connecticut Board of Education. (New York: A. S. Barnes & Co.)—Five of these essays are on the importance of education to labor, to the industrial arts, invention, and the amicable relations of labor and capital; the rest treat of the legal prevention of illiteracy; culture and knowledge, the professional study, study and health, and the question, "Should American youth be educated abroad?" The last-named enquiry occupies nearly half the book, and will be still further pursued in another volume, on 'The Schools of Europe, and What we ought to Learn from Them.' It consists of letters elicited by Mr. Northrop from a large number of college presidents and other instructors, in which there is a general unanimity of opinion that for young Americans the very best *collegiate* training is to be had at home, and that Europe holds out positive advantages only for college graduates desirous of perfecting themselves in technical or professional studies. The moral (meaning not merely the ethical) reasons for forming the character and informing the mind of a child in his native country, are very forcibly presented by several of Mr. Northrop's correspondents, by none more pithily than by President Eliot. Mr. Northrop himself adds little to the discussion, but sums up the points made in the course of it. We presume he had President Barnard's letter in mind when, mentioning as the last objection the cost of foreign education, he concludes that "the export and appreciation of gold and corresponding depreciation of our currency are sensibly affected by this mania for European education." But what Dr. Barnard had said was this:

"When, by the concurrent action of many individuals, with or without concert, a large amount of money is annually withdrawn from the country, to be expended upon any given object elsewhere, it becomes a matter of public concernment to ascertain whether the benefit secured is a fair equivalent for the outlay. Should this not appear to be the case, and should it be further evident that, as a consequence of the withdrawal of such considerable sums, the whole country is made to suffer in the important interests which such withdrawal affects, the case becomes sufficiently serious to occupy the attention of the thoughtful, and to justify effort to remedy the evil or to arrest its growth."

These are very different propositions from the one about the currency, especially if we are called upon to give our assent to the latter.

Mr. Northrop records some interesting facts in regard to the inventive genius of the people of Connecticut, as revealed by the Patent Office statistics, and also claims for the State the honor of being, with Massachusetts, the first to enforce attendance on school. "After the trial of a compulsory law for more than a century, Connecticut has just re-enacted this principle." We hope she will never let go of it.

HAVE JUST PUBLISHED

TYLOR'S (E. B.) PRIMITIVE CULTURE. Primitive Culture: Researches into the Development of Mythology, Philosophy, Religion, Art, and Custom. *First* American from the Second London edition. 2 vols. 8vo, $5.

"Those who have not read the earlier volume, and who know the author only by hearsay or not at all, have yet before them an intellectual feast the like of which they will have seldom enjoyed; for the present is one of the few erudite treatises which are at once truly great and thoroughly entertaining. . . . We do not know how we can more aptly express our sense of the thoroughness of Mr. Tylor's scientific culture than by saying that he constantly reminds us of the illustrious author of the 'Origin of Species.' . . . In tracking the wilderness of primeval speculation, he is a guide no less safe than delightful."—*North American Review.*

FREEMAN'S (EDWARD A.) HISTORICAL COURSE. Vol. III. Scotland. By Miss MacArthur.

It is hoped in time to take in short histories of all the chief countries of Europe and America. Those of England and Scotland are ready, and authors are at work on other parts of the plan. All the works will be edited by Mr. Freeman, and adapted for the use of American students.

CORRESPONDENCE.

The Fire at Eatontown.

ITS PROGRESS ARRESTED BY THE BABCOCK ENGINE FROM LONG BRANCH.

LONG BRANCH, N. J., December 11, 1873.

F. W. FARWELL, SECRETARY:

DEAR SIR: We have received great praise for our company and the Babcock Engine for work done at a large fire at Eatontown on Wednesday morning. We received the alarm at 2 A.M., and ran to Eatontown (3½ miles) in twenty minutes; found four buildings about falling in, and Wheeler's large hotel on fire in a dozen places; owing to the high wind driving the flames upon the hotel, we were unable to save that, and directed our efforts to checking the course of the fire. We succeeded in doing so, saving a building within sixteen feet of the hotel; had this building burned, nothing would have saved the seven adjoining ones, as they are built close together, and probably the greater part of the town would have gone. The wind was blowing at a fearful rate, and we had a hot time of it, working about three hours. It is acknowledged on all sides that, but for the Babcock, Eatontown would now be in ashes.

Yours respectfully, F. W. KEMP,
Assistant Foreman Oceanic, No. 1.

Incendiary Fire at Topeka, Kan.

OFFICE OF CHIEF ENGINEER, TOPEKA, KAN., NOV. 19, 1873.

BABCOCK MANUFACTURING COMPANY:

GENTLEMEN: At an incendiary fire at 5 o'clock this morning, in a boot and shoe house in the heart of the city, our Babcock Engine did the entire work, saving building and stock, with a loss of less than $1,000. Insurance on stock alone was $12,000. A better saved stock, as regards its condition after the fire, can seldom be found. The fire had been set in four places in the building, all at the same time, and was aided by the use of oils. Steamers were not required at all.

Very truly yours, G. O. WILMARTH,
Chief Engineer Topeka Fire Department.

A Brave New Yorker.

FURTHER HONORS FOR LIEUTENANT T. B. M. MASON.

A private letter from Panama, dated September 27, thus relates how the natives were astonished by the use of Babcock Extinguishers in a case of great danger:

"An incident recently occurred in the harbor of Panama by which an explosion of gunpowder was prevented by your Government officials. It seems to me well worthy of record. A Portuguese vessel, loaded with powder and petroleum, had taken fire, and the boats of the vessels lying near—some of which were foreign men-of-war—surrounded her, but with their aid the crew had succeeded in doing nothing to effectually check the flames. A boat from the flagship *Pensacola*, commanded by the Second Lieutenant (T. B. M. Mason, of New York), came alongside, and the foreigners exclaimed, 'Here come the Yankees with their d——d machines! Now we will see what they can do.' Lieutenant Mason, with three men, each with a Babcock Extinguisher on his back, boarded the vessel, and made quick work with the fire on deck; they then descended into the hold, where was the seat of the conflagration, and extinguished it promptly without regarding the proximity of the powder. The foreigners at once changed their sneering doubts as to the machines into congratulations for those who had used them so boldly, and the Portuguese Consul at once visited the flagship, returned thanks on behalf of his Government, and asked the names of those engaged. Lieutenant Mason, who volunteered for the duty, is the same officer to whom your Congress gave permission last winter to accept the Order of the Rose, conferred on him by the Emperor of Brazil a few years ago as a midshipman, for another gallant exploit in saving the lives of two sailors in one of the harbors of Brazil."—*The Evening Post*, N. Y., Oct., 1873.

Fire in Orange.

HASTINGS & BRUSH, 57 WALKER STREET,
NEW YORK, November 25, 1873.

F. W. FARWELL, SECRETARY:

DEAR SIR: I take great pleasure in informing you that by the use of one of your Babcock Extinguishers, I saved my house in Orange, N. J., from destruction last evening. The fire was caused by the explosion of a German student's lamp, which was being filled carelessly while burning. While I was up-stairs after the Extinguisher, which I purchased of you in May, 1872, and which was filled and set away at that time, and had not been touched since, an attempt was made to quench the fire by the application of pails of water; but the result was only an increase of the flames. By the use of the machine the fire was put out in less than five seconds, and the damage done, aside from the total destruction of the lamp, was very small indeed.

As I think the size I have is too heavy for my wife to use in my absence, I wish you would send me one of your smallest size. You may freely refer to me any parties who are at all doubtful of its utility.

Respectfully yours, CLINTON E. BRUSH.

Fire at Port Jefferson.

PORT JEFFERSON, N. Y., October 14, 1873.

F. W. FARWELL, SECRETARY:

DEAR SIR: It affords me pleasure to testify to the effectiveness of the Babcock Extinguisher. I chanced to be in the shipyard of J. M. Bayles & Son, of this place, on the afternoon of October 1, when a fire broke out in the galley of the brig *Katie*, lying on the ways in that yard. A score or two of men with buckets of water at once set to work deluging the flames, but without staying their progress—in fact, the men said it seemed as though the more water they threw on, the faster the fire burned. At this critical moment one of the Babcock Extinguishers was obtained and put to work. The result was marvellous; the flames were smothered in an instant. Had it not been for the timely arrival of the Babcock, no one can tell where the fire would have stopped; certainly part of the village would have been in ashes.

Yours respectfully, R. M. BAYLES.

—*Evening Post, October* 16, 1873.

CASSELL, PETTER & GALPIN'S

ILLUSTRATED BOOKS.

The great modern work on the Bible, just arrived, price $3.

VOL. I. OF THE BIBLE EDUCATOR.

Edited by Rev. E. H. Plumptre, M.A., King's College, London.

Vol. I. of the 'Bible Educator' contains 124 separate articles, with 120 Engravings and Maps.

Among the contributors are the Dean of Canterbury, Rev. Stanley Leathes, M.A., Rev. Samuel Cox of Nottingham, Rev. Dr. Hanna of Edinburgh, Rev. F. W. Farrar of Marlborough College, Canon Rawlinson, M.A., and many others.

Now ready, royal 4to, cloth, gilt edges, $15.

DAILY DEVOTION FOR THE Household. Containing a short Prayer, with Hymn and a portion of Scripture, for every Morning and Evening in the Year, with a few Special Services for special family occasions. Illustrated with 24 full-page Plates and Engraved title-page.

Now ready, with about 200 Illustrations, price $5.

OLD AND NEW LONDON. By Walter Thornbury. Vol. I. A Narrative of its History, its People, and its Places. Extra crown 4to, 576 pages, cloth.

Now ready, with about 200 Illustrations, price $5.

BRITISH BATTLES ON LAND AND Sea. Vol. I. By James Grant, author of 'The Romance of War.' Extra crown 4to, 576 pages, cloth.

Now ready, Illustrated throughout, price $3.

THE RACES OF MANKIND. Vol. I. A Popular Description of the Characteristics, Manners, and Customs of the Principal Varieties of the Human Family. By Robert Brown, M.A., Ph.D., F.R.G.S., etc. 384 pages, extra crown 4to, cloth.

Now ready, 600 pages, demy 4to, price $15.

THE ILLUSTRATED BOOK OF Poultry. By L. Wright, author of 'The Practical Poultry-Keeper.' A Complete and Practical Treatise on the Breeding, Rearing, and Management of every known variety of Poultry. With 50 exquisitely Colored Plates of celebrated Prize Birds of every Breed, painted from life expressly for this work, and with numerous Engravings on Wood.

Now ready, 2 vols., cloth, $10.

CASSELL'S HISTORY OF THE War between France and Germany. By Edmund Ollier. Containing nearly 500 Illustrations, consisting of Battle Scenes, Portraits, and plans of the Battlefields.

Now ready, with 500 Illustrations, price $3.

CASSELL'S RECREATOR. Vol. I. A Guide and Key to Indoor and Outdoor Amusement. 384 pages, extra crown 4to, cloth.

A BOOK OF FAIR WOMEN. Containing 40 highly finished Engravings, beautifully printed, with appropriate Poems by various authors. Printed on superfine paper, extra fcap. 4to, bevelled boards, gilt edges, $3.

CHAPTERS ON TREES. A Popular Account of their Nature and Uses. By M. and E. Kirby, authors of 'The Birds of the Land and Water.' Profusely Illustrated. 320 pp. extra crown 8vo, cloth, gilt, $2 50.

Full Descriptive Catalogues free by mail on application.

ILLUSTRATED FINE ART CATA- logue. Royal 4to, 64 pp., colored frontispiece, post-paid, for $1 25.

'Cassell's Illustrated Catalogue,' though ostensibly a mere advertising circular, contains such a profusion of admirably executed woodcuts that it is decidedly more attractive to lovers of art than is the average gift-book.

CASSELL, PETTER & GALPIN,
596 Broadway, New York.

THE WEEK IN TRADE AND FINANCE.

DECEMBER 15.

THE week in Wall Street has been marked by increased buoyancy in the different markets. An upward movement in gold has commenced and made considerable progress, based upon an active demand and sharp advance in the rates for exchange. Besides the firmness of exchange, the news from Washington in relation to financial affairs has been highly conducive to a rise in gold, as well as to encouraging speculation at the Stock Exchange. The continued drafts of Mr. Richardson upon his "$44,000,000 reserve" have put into circulation, up to the close of the week on Saturday, $17,221,000 additional currency—the outstanding legal tenders on that day being officially stated at $373,221,000, against $350,000,000, the amount to which they had been reduced under the law by Secretary McCulloch. The rate at which the "reserve" is being used up and put in circulation is very assuring to the Wall-Street bull; at any rate, it has started up a speculation which promises very well for the future profit of that lately severely handled animal. Of course, this issue of new currency is readily explained by the fact that the Treasury Department has suddenly found itself short of money, in consequence of diminished revenue receipts, and, like anybody else in such a position, gives its promises to pay—with this difference, however, that it knows that the obligation cannot be paid when due and presented. Congress is considerably interested just now in the currency question, and it is to be hoped that, before the adjournment takes place, some plan may be devised and carried through which will be of real benefit to the country; and no plan can be of benefit unless it is one looking to the resumption of specie payments within a reasonable space of time.

The money market has remained easy, with rates on call loans ranging between 5 and 7 per cent. The best grades of commercial paper pass freely at 9 to 12 per cent., with a tendency towards greater ease in rates.

Cable advices received on Thursday stated that the Bank of England minimum rate of discount had been reduced from 5 to 4½ per cent.; the Bank gained £618,000 in bullion during the week.

The statement of the Clearing-House banks for the week ending December 13 was favorable. The total liabilities showed an increase of $8,020,000, which amount is met by a gain of $5,007,500 in legal tenders and specie. The surplus reserve of the banks was increased from $7,072,250 to $10,074,750—a gain of $3,002,500 for the week. The Clearing-House certificates now outstanding amount to less than $5,000,000.

The following is a comparison of the averages for the past two weeks:

	Dec. 6.	Dec. 13.	Differences.
Loans	$252,373,500	$254,520,600	Inc...$2,147,100
Specie	21,158,600	22,319,500	Inc.... 1,160,900
Legal tenders	38,214,000	42,060,600	Inc... 3,846,600
Deposits	182,015,300	190,054,200	Inc... 8,038 900
Circulation	27,186,100	27,167,200	Dec... 18,900

The stock market has been active and strong throughout the greater part of the week; prices continued to advance until Friday, when a reaction took place, caused partly by holders selling out for the purpose of realizing their profits. At the close on Saturday a sharp rally occurred late in the day, and the market closed with the same buoyant feeling which prevailed during the early part of the week. The dividend-paying investment stocks have all been firm, Fort Wayne selling at 90, Delaware, Lackawanna, and Western at 100½, New Jersey Central at par, and Chicago, Burlington, and Quincy at 96. There has been some little activity in Michigan Central at 73 to 75; the reason for this stock remaining at nearly "panic prices," in the face of a strong market for nearly everything else on the list, is probably because there is no chance of the payment of a dividend in January, and not much hope of any for perhaps a year to come. Too many unproductive branch roads have been fastened on to the Michigan Central, and too little attention paid to the interests of the main line.

The following shows the highest and lowest sales of the leading stocks at the Stock Exchange for the week ending Saturday, December 13, 1873:

	Monday.		Tuesday.		Wed'day.		Thursday		Friday.		Saturday		Sales.

The Government bond market requires little comment; prices have steadily advanced, and at the close of business on Saturday the market shows an advance of 1½ to 2½ per cent. for the week, coupon 6's of 1881 being quoted at 119; 5-20's of 1865, 115½; 65's, new, 118¼; 67's, 118¾; and 68's, 118½.

The market for railroad bonds continues active, and prices are higher, especially for the bonds of the Central and Union Pacific Railroads, which were previously low, and consequently attractive to investors. The investment demand after 1st proximo for good bonds will undoubtedly be large, as capital will naturally tend towards those securities dealt in at the Stock Exchange, in preference to those of new and uncompleted lines, which have been affected by the panic. The Lake Shore and Michigan Southern Railroad Company will shortly issue second-mortgage bonds to the amount of $25,000,000, for the purpose of funding the floating debt, about $4,000,000, and to provide for the exchange of $6,000,000 debenture bonds now outstanding; the remaining $15,000,000 will be used as needed in completing the double tracking of the road, which is now ready for the rails. The debt of this Company will then stand as follows: capital stock, $50,000,000; first-mortgage bonds, $25,000,000; second-mortgage bonds, $25,000,000.

The gold market has been strong throughout the week. The quotations have ranged between 109 on Monday and 110¼ on Saturday, closing at the highest point of the week. The advance in the premium is due to the continued increase of the currency and the firmness of exchange; besides which we hear that a party has taken hold of the market for the purpose of putting it up, having been attracted thereto by its low price, and the probability of an inflation of the currency beyond the $44,000,000 which is now being set afloat.

TO TEACHERS AND STUDENTS.

Ready next Week:

The following volumes of "PUTNAM'S ELEMENTARY SCIENCE SERIES."

I.

ELEMENTS OF ANIMAL PHYSIOLOGY, CHIEFLY HUMAN. By Prof. John Angell, of the Manchester Science School, with eighty-three illustrations. 12mo, cloth, 75 cents.

II.

A MANUAL OF QUALITATIVE CHEMICAL ANALYSIS. By Prof. F. Bulstein, of the University of Göttingen. Translated by William Ramsay. 12mo, cloth 75 cents.

III.

AN ELEMENTARY TREATISE on Nautical Astronomy. By Prof. Henry Evers, LL.D., of Plymouth, England. With full diagrams. 12mo, cloth, 75 cents.

IV.

GEOLOGY FOR BEGINNERS. By W. S. Davis. Illustrated. 12mo, cloth, 75 cts.

The following volumes have already been published in this series:

1. Practical Plane and Solid Geometry. Angell.
2. Machine Construction and Drawing. Tomkins.
8. Acoustics, Light, and Heat. Lees.
11. Organic Chemistry. Watts.
13. Mineralogy. Collins.
17. Systematic and Economic Botany. Balfour.
20. Navigation. Evers.
22 a. Steam and Steam-Engine, Land and Marine. Evers.
22 b. Steam and Steam-Engine, Locomotive. Evers.
23. Physical Geography. Macturk.
24. Practical Chemistry. Howard.
25. Astronomy. Plummer.

All of the above are fully illustrated, and sell at the uniform price of 75 cents each.

"The volumes of 'Putnam's Elementary Science Series' . . . contain more information for the price than anything of the kind we have seen."—*N. Y. Evening Mail.*

Also Ready,

IN "PUTNAM'S ADVANCED SCIENCE SERIES,"

A new Edition of

STEAM AND THE STEAM-ENGINE, LAND, MARINE, and LOCOMOTIVE. By Henry Evers, LL.D. 12mo, cloth, fully illustrated, reduced to $1 25.

"An admirable guide to the study of this important subject."—*N. Y. Evening Post.*

Specimen copies of the above mailed, prepaid, to teachers for examination on receipt of half the price. Liberal terms for introduction.

G. P. PUTNAM'S SONS,
NEW YORK.

The London *Spectator*, at the close of a review criticising severely 'LIBERTY, EQUALITY, FRATERNITY,' calls it—

"One of the strongest books by one of the strongest men of our day."

CRITICAL AND SOCIAL ESSAYS. Reprinted from the *Nation*, and in some measure supplying the place of the first two volumes of the paper, now rather scarce. Cloth, 12mo, price $1 50. Sent, post-paid, on receipt of price by the Publisher of the *Nation*.

ECLECTIC MAGAZINE Of Foreign Literature and Science. $5 a year, 45 cents a copy.
E. R. PELTON, Publisher, 108 Fulton Street, N. Y.

The Nation.

NEW YORK, THURSDAY, DECEMBER 25, 1873.

The Week.

CONGRESS has adjourned for the holidays without doing anything of importance. The dispute between Mr. Richardson and the Ways and Means Committee has ended for the time being in a compromise by which no increased taxation is to be tried until it is seen how the experiment of cutting down the estimates will work. It is now said that some $20,000,000 can be saved by this means alone. The salary-grab debate has also temporarily ended in a vote for the passage of a new grab act, which enables the members to retain all the increased pay they have drawn since March 4, gives them $500 a year in excess of the old salary, and adds to it an allowance for mileage and stationery and actual travelling expenses, retaining also all the increased salaries of the non-Congressional officials. It having been discovered that Mr. Hale of New York had acted as Government counsel before the British-American Claims Commission, and Mr. Hale having offended his colleagues by a severe denunciation of the grab, Mr. Wilson of Indiana introduced an amendment providing that any member of Congress who had received counsel-fees from the Government while acting as member of Congress should have his fees deducted from his future salary. This was too much for the endurance of Mr. Hale, who subsequently rose to a personal explanation, and accused General Butler of having concocted the amendment, and having got Mr. Wilson to introduce it by "reaching his arm around Mr. Eldridge" of Wisconsin. He then proceeded to compare Mr. Wilson to a "dirty cur"; on which Mr. Wilson replied that he (Mr. Hale) was another; and Mr. Butler, who had meantime got a copy of Mr. Hale's accounts from the Treasury Department, exhibited them to the House, and compared the "grabbers" to the woman taken in adultery, and Mr. Hale and his kind to her accusers.

The bill for the repeal of the Bankruptcy Act is now in the Senate, having passed the House by a vote of 224 to 40, under the operation of the previous question. It is a remarkable fact that this bill, which will change the relations of creditors and debtors throughout a commercial country of 40,000,000 population, has passed the House with hardly a word of debate except on one point, and that this one should have been on the question whether the bill, as reported by the committee, had not been prepared by the principal bankrupt in the country for his private benefit. The bill as reported contained the very curious clause that, as to pending cases, a majority of the creditors in value should have full power to dispose of the estate in any way they should see fit, and that they might, if they saw fit, put it back "in the banks of the debtor." Mr. Wilson of Indiana, on the introduction of this bill, he being himself a member of the committee which introduced it, told the House that these clauses as to pending cases were drawn by an attorney of Jay Cooke & Co. to enable them to get control of their assets and go on with their speculations, and the bill ought to be called "a measure to embarrass justice." The House voted at once against the clauses, and certainly did quite right in voting against them; but if the debate on this bill is to be a sample of the discussion which is to take place in the Senate, we might almost as well have no debating at all. The Bankruptcy Act is needed, and it ought to be amended, not repealed. A petition from New York merchants has been sent to the Senate, complaining of the haste of the House in repealing the act, and opposing repeal. One of the strong arguments against the act all along has been, that the "moneyed men of New York" were in favor of total repeal, but the moneyed men themselves say that their opinion has not even been asked.

The nomination of Attorney-General Williams has not yet been acted upon by the Senate, and, in the meanwhile, one of the charges or rumors has taken pretty definite shape. It seems that the firm of Jackson & Polhemus, of this city, were indicted for receiving money from a disbursing officer knowing it to be the money of the Government. They had offered $200,000 in settlement, which was declined, and criminal proceedings were instituted. These proceedings mysteriously ceased, and it has been publicly charged that $100,000 was paid for their discontinuance, $60,000 of which went to "a member of the Attorney-General's family." The Attorney-General has given an "explanation" of the affair which the Judiciary Committee of the Senate, it is said, have deemed to be "satisfactory." The satisfactory explanation is this: The defendants demurred or moved to quash the indictment, upon the ground that the statute under which it was found had been repealed. Thereupon the District-Attorney, with the approval of the Attorney-General, proposed to drop the criminal proceedings in as private a way as possible, so that he might hold the repealed statute *in terrorem* over the heads of other guilty parties, and, for aught we know, get a conviction or two where the prisoners were not so fortunate in their counsel as Messrs. Jackson & Polhemus. Whether this explanation raises the character of the Attorney-General in the opinion of the Senate, we are not informed; but whether the trick of pretending to indict people under a statute which has ceased to exist savors most of judicial dignity and integrity or of the sharp practice of a Tombs lawyer, is a question upon which two respectable men will not be apt to divide.

Judging from the tenor of the debates which have taken place thus far, both in the House and Senate, on the currency question, we are about to witness the same mode of opposition to the resumption of specie payments with which we were made so familiar during the debates on civil-service reform. That is, nearly all those who are opposed to expansion, and believe that greenbacks ought to be made redeemable in gold, are nevertheless always opposed to any "particular measure" designed to bring about that result. Contraction, they say, would ruin us, and inflation would ruin us. We cannot redeem unless we have gold enough in the Treasury to do so with safety. Being asked when they think there will be gold enough in the Treasury to resume, they say that it will be when "the balance of trade" is in our favor. Being informed that "the balance of trade" is now in our favor, they say that we are suffering from a terrible panic, which would make any further lowering of prices dangerous. When, on the other hand, they were asked to resume before the panic, they said either that "the balance of trade" was against us, or that the country was so prosperous that it would be folly to make any change. In short, there appears to be no way of driving them into a corner. Mr. Boutwell is firmly opposed to any "particular measure." Since the failure of his plan of making all things right by buying up bonds before they were due, he has apparently lost faith in human devices. Mr. Morton says he is also opposed to "any particular measure." He thinks we ought to keep "in view a return to specie payments," but evidently thinks it ought to be a far-distant view. He says he "once had a sort of fanaticism about specie payments himself, but experience and lapse of time cured him." Was this interesting period in his career before or after his proposal to pay off the public creditors in depreciated paper? He was not cured of that by either "time or experience," but by the very vulgar discovery that his was not the way the cat was jumping, so he wheeled right about. It will not do for him now to try to pass himself off on us as a wise old financier who has seen the vanity of gold and silver, as well as of promissory notes, and smiles at our childish eagerness for them.

There is no question that the scandalous appointments made of late years to the Federal bench did a good deal to defeat the attempt to get rid of an elective judiciary in this State. One of the worst of the appointees, that of Underwood in Virginia, made by Mr. Lincoln, has been removed by death. No more need be said about him. Another, and a still worse one, was Richard Busteed, to the District Court in Alabama. Busteed, who was familiarly known as "Dick," and "galorious Dick," was, at the outbreak of the war, one of the roughs of the New York bar—a man without learning or character, an active Tammany politician, and a noted brawler in court. He turned Republican in 1861, and was promptly made a Brigadier-General. As a strategist he proved a total failure, as he was unable to ride on horseback, and, as it would have been ridiculous to go into battle in a buggy, he expressed a desire for translation to the judicial bench, which was also promptly complied with, and he was sent down to Alabama as soon as the army opened the way for him. Since then he has been a standing nuisance and disgrace. The unfortunate people of the State have several times tried to have him impeached, but as "Dick" was loyal, while they were not, they failed, until he quarrelled with Spencer, one of the present senators. Of late he has had the good sense to keep his court closed and spend his time at the North, where on one occasion he went out fishing with one of the parties to a suit pending before him, and granted him an order which enabled him to get the money in dispute out of the country, and thus deprive the plaintiff of all remedy. A committee of the House has at last been appointed to investigate his doings, and his impeachment will doubtless follow.

A similar step has been taken with regard to Judge Durell of Louisiana, who recently "enjoined" the State government and set up one of his own. He is a terrible drunkard, and is accused of keeping "a Gratz," with whom he divides bankrupt estates. With Underwood dead, and Busteed, Delahay, Durell, and Sherman cleared off, much will have been done for the purification of the Federal bench, but our friends in other States will see how much the spectacle offered by these worthies has told against all efforts for a better system here. We agree with the *World*, that if the vote were now to be taken over again, the majority against appointment would be greater than it was, owing to the scandal of the process through which Mr. Williams's nomination is passing. The shame and absurdity of an official enquiry into the private character of a candidate for the Chief-Justiceship of the Supreme Court of the United States, is something on which we need not dwell. It is like the investigation of charges of unchastity and embezzlement against a bishop, as a preliminary to his consecration.

The new Pennsylvania Constitution has been adopted by an overwhelming popular vote, the Ring being defeated even in Philadelphia. The struggle between the respectable classes and the officials who had got control of the city was not so desperate a contest by any means as that between the same classes in New York and Tweed; but there were a good many points of resemblance. Among these was the part taken by some of the best-known lawyers in the State in the effort to secure the adoption of the Constitution. Even Chief-Justice Agnew, of the same Court which had just declared the special-election ordinance of the Convention void, expressed himself in favor of the adoption of the instrument; and many prominent lawyers besides took part in the agitation who ordinarily have been in the habit of looking upon politics with indifference or contempt. The joy over the result is universal, we may almost say, throughout the country, for the condition of Pennsylvania politics has been, for the past ten years, pretty well understood outside the State; the relation of wealthy and well-to-do quiet Philadelphians to the politicians of their own city has been for a long time something like that of a subject to a dominant race. An idea of what the state of affairs has been in the past may be inferred from the fact, which does not seem to be as generally known as it ought to be, that four or five years since a commission was appointed to revise the laws of Pennsylvania, and the character of the appointees was such that it was discovered, when they had finished their work, that they had turned several laws not merely into confusion, but into unintelligible gibberish.

The surrender of the *Virginius* to the United States officers took place quietly on Tuesday week at Bahia Honda. She was delivered by a Spanish sloop-of-war to the United States despatch-boat without fuss or ceremony, and in the silence and almost solitude of an unfrequented bay. The surviving prisoners have since been surrendered also. The Spanish Government has now submitted evidence on which Attorney-General Williams has advised the State Department that the papers of the *Virginius* were obtained fraudulently, and by perjury on the part of Mr. Patterson—the Cuban Junta in this city, or certain members of it, being the owners of the ship either wholly or in part—and that she was therefore not entitled to the American flag, which accordingly will not be saluted on Christmas Day. This accounts for the strange indifference of Mr. Patterson to the fate of his ship, and also for his reluctance to "come to the front." It is proper to observe that, no matter who owned this ship, it has been notorious for a year past that she was engaged in filibustering business, that there was little concealment about her errand when she last left an American port, that she has now cost the country $5,000,000, or almost one-third of the sum received from the British Government in payment of the damages caused by the Confederate cruisers, and that she has been very near causing a war which would have cost us some hundreds of millions of dollars. The inference is, we think, obvious.

A correspondent writes us from New Orleans that the present city government, which is composed of respectable Democrats, has made itself intensely unpopular by enforcing the collection of taxes to meet the interest on the city debt of $20,000,000. The State debt being $22,000,000 more, and a large part of it being fraudulent, there is a strong feeling in favor of suspension of payment of interest on both. The carpet-baggers and bond-holders, however, do not take this simple view of the matter, and they are preparing a funding bill to be presented to the next legislature in January. This bill is to provide for the funding of all old bonds (now worth 41) into a new consolidated bond—bearing about the same interest as the old issue—at the rate of two dollars in new bonds for three dollars in old ones. This would bring the total State debt down to about fifteen millions, and it is proposed then to adopt an amendment to the Constitution of the State declaring this fifteen millions to be inviolable, and prohibiting for ever the contraction of any additional debts. The State government could probably manage to pay the interest on these new bonds, and would then leave the old bondholders who might refuse to "fund" out in the cold, with unpaid coupons accumulating on their hands. It is said that this is the only alternative of repudiation or, what is as bad for the bondholder, a suspension of the payment of interest for an indefinite period.

The farmers during the past week have given little signs of activity, except in a meeting of the State Farmers' Association in Illinois. This is a political body, as our readers will remember, while the Grange, whose proceedings we noticed last week, is non-political. There is, however, this tie between them, that the members are the same, or nearly the same. In the one, they act in their capacity of agriculturists; in the other, in that of American citizens. It is a noticeable thing that while the farmers of Illinois, in their agricultural capacity, demanded Government aid last week, they have this week, in their capacity of American citizens, denounced Government aid, and declared that the Cheap Transportation question is a matter which belongs inalienably to the separate States, and that the United States have nothing

to do with it. The meaning of this strange state of affairs we take to be this. Originally—that is, three or four years ago—when nobody heard anything about them, the Granges were really non-political, and they now, something like Eastern trades-unions, have strictly class-interests at heart; they have, however, been in a measure "captured" by the politicians of their own body, who have got them to organize Farmers' Associations for political purposes. The politicians like Flagg and Smith having discovered that Congress will not do much this winter for cheap transportation, naturally fall back for support on the local *pro-rata* laws, while the poor farmers themselves, in the Grange, go on insisting that in the last resort they will have a Government freight-railroad. In Kansas, the farmers' movement has developed, as we said it would last summer, into a quarrel between the railroads and settlers over the title to land, and the settlers are confident of sending a senator to Washington to urge their claims. They want the United States to bring a suit-at-law—we presume like the Crédit-Mobilier suit lately brought—for their benefit.

Probably nothing did more to detract from the pleasure caused by the conviction of Tweed than the reflection that his three confederates, Connolly, Sweeny, and Hall, had escaped justice. Connolly and Sweeny judiciously withdrew to Europe when the storm first began, and are there living in comfort, among the despots of that continent, on the proceeds of their plunder. Hall, the Mayor, who took his share of booty mainly in law business for his firm, and thought that by handing the work of "auditing" over to Tweed he should escape his share of the responsibility, stayed at his post, however, and has stood two trials under the old jury-law, the jury disagreeing in each case. Gathering courage as time rolled on, he actually appeared as a lecturer on "Marriage and Divorce," and tried to diffuse the theory that he was a simple-minded man with "no head for details," who had been deceived by Tweed and Connolly—he who had been a Tammany District-Attorney for many years, and used to wear a green coat and necktie on Patrick's Day. When it was reported that no further attempt would be made to bring him to justice, most people felt that the punishment of the Ring frauds was very far from complete, and that the spectacle of Hall's liberty would be a heavy blow to the cause of reform. We are glad to say that wiser counsels have prevailed, and at this writing he has just been arraigned again, and it is to be hoped will now, under the new jury law, follow his old Boss to Blackwell's Island. The striped flannel jacket will be a highly appropriate substitute for the green coat, and the love of Ireland be very fitly succeeded by the cravings of low diet.

The statement of Captain Surmont as to the cause of the disaster to the *Ville du Havre* has reached this country, and also the evidence of one of the crew who was one of the lookout at the moment of its occurrence. Captain Surmont has little to say that is new. He had, however, just waked up, and stepped out on deck the moment before the collision, but too late to avert it. It may serve as a caution against hasty judgment to say that the accusation brought against him by "an old shipmaster" in the Boston *Advertiser*, the other day, of bad seamanship in going to bed without leaving direction that he should be called in case a sail came in sight, appears to be disposed of by his statement that he left written orders every night, and on this night in particular, that the officer on duty "should inform him of the slightest occurrence." On the other hand, the evidence of Captain Roberts of the *Loch Earn* has come to hand, and is strong and positive, that the collision was due to an attempt on the part of the *Ville du Havre* to cross his bows at the last moment. It will be remembered that, under the rule of the sea, all that Captain Roberts has to show is that his lights were in order, and that he held steadily on his course.

The news from San Domingo throws some curious light on the value of the report made by the Commission sent down three years ago by the President to enquire into the condition of San Domingo, and also on the danger of fancying that one understands tropical politics. The report represented Baez as commanding the full confidence of the people, and the people as being eager for annexation to the United States. A revolution has just occurred in the Republic, however, by which Baez has been driven out of power, and the insurgents have drawn up an indictment against him which, if true, shows him to be a dreadfully bad man, and, even if not true, shows that, so far from being authorized to sell "the people" to the United States, he did not even enjoy their confidence. But what about the "plébiscite" in favor of annexation which was taken in 1870?—the reader will say. Well, we don't know what to say about it. We have no explanation to offer of the phenomena of tropical politics beyond this, that we have little doubt there are few citizens of the tropical republics to whom eating a mango and voting the transfer of their country to a foreign power, are not acts of about equal solemnity.

The Provisional Government which has been established at San Domingo has issued a proclamation accusing Baez of violating the constitution in all its points, of cruelty to political prisoners, of malversation of the public funds, of tyrannical conduct towards the clergy, of unlawful interference with the liberty of the press, of unconstitutionally offering the Republic for sale in the American market for $1,000,000, of unlawful exactions, of the violation of private correspondence in the post-office, of prohibiting public meetings, of corrupt rearrangement of the electoral college so as to secure his own re-election, of disregarding the provisions of the constitution regarding popular education, and of arbitrary interference with trade and commerce. General Gonzales is the head of the new Government, or "Supreme Chief of the Revolution," as he is called, and he has put in a new ministry. The new régime is said not to be hostile to the Samana Bay Company.

The Pope has issued a new Encyclical Letter, in which he bewails the suppression of the convents in Rome and of the Roman University; denounces the oath imposed by the Canton of Geneva on parish priests and their assistants; bewails the dreadful state of things in the diocese of Basle; thinks that it would be just as fair to blame the martyrs of the early church for shedding their blood for the faith of Christ and for the liberty of the church as to blame the German clergy for not obeying the recent ecclesiastical legislation of Prussia; is sorrowful over the accusations brought by the Emperor of Germany in his recent letter against his Catholic subjects, whom he (the Pope) highly lauds; considers the request that he should advise submission to this legislation as equivalent to a request that he should lend his help "in scattering the flock of Christ"; denounces the patronage of the Old-Catholics by the German governments; denounces the Old-Catholic "pseudo-bishop" Reinkens as a "notorious apostate," and "the impudence" of getting him consecrated by the Utrecht Jansenists, and says he is no bishop at all, and solemnly excommunicates him, and all who have had hand, act, or part in his consecration. Turning his attention to America, His Holiness finds the state of things in that quarter of the world equally deplorable, where a warfare of a most desperate character is, it appears, waged against the church by Freemasons and other sects, who jointly compose an organization called "the synagogue of Satan." As a remedy for all these evils, he calls on the clergy to be constant in prayer, so as to appease the anger of heaven. He is evidently of opinion that the Freemasons, and the Methodists, Baptists, and other Protestant denominations, are birds of a feather, and equally dangerous to faith and morals. The most curious thing about these Encyclical Letters is, however, their continued despondency. Year after year they depict a state of things in which Satan is steadily gaining on the church, and in which the ecclesiastical opposition to him seems to come to nothing. For instance, it is commonly supposed by Protestants that the Catholic lookout in this country is a cheerful one, but at Rome there is as much gloom apparently about us as about any other nation. If there is any truth in the Pope's view, things cannot go on much longer as they are.

THE MULTITUDE OF FINANCIERS.

WE regret to say that we do not find in any quarter much satisfaction with the doings thus far of the present Congress. The newspapers have already begun to teem with denunciations of it, and even the warmest Republican organs openly warn the members that they need not hope to sit in another Congress, and wish that they had never met. The causes of this dissatisfaction lie on the surface, and Congress is not altogether to blame for them. Any Congress that could meet at this crisis would be sure to fall short of popular expectation, partly owing to the excited state of feeling produced by the panic, and partly owing to the disorganizing influence on public opinion exerted by the Administration. What we mean by the excited state of public feeling hardly needs explanation. The panic has, owing to the peculiar condition of the currency, plunged the country into more than ordinary perplexity. A panic is at any time bad enough, and the panic of 1857 went deeper and produced more widespread ruin than the present one, but the way to recovery was much plainer. It was what has been called a "credit panic"; that is, there had been over-producing, and over-trading, and over-issuing of paper, not in one field of industry only but in all. But when the crash came, there was nothing abnormal in the relations of the Government to the community. There was no commercial providence at the White House, and no "Uncle" or "Daddy" in the Treasury Department. The currency was still the currency of the civilized world, which the experience of many ages and many nations commended as the best possible. There was a great deal of "paper," both bank bills and merchants' bills, afloat, bearing promises to pay, which did not prove redeemable. But there was no haze over men's ideas on the subject of the circulating medium. The air was not filled with windy metaphysical essays on ideal "money." People knew what actual human money was, and cared nothing about "money" of the mind dreamed of by crack-brained speculators and "bankers" and communists and philanthropists. If a man owed a thousand dollars, and could not pay them, he went to his creditor frankly and said so; he did not write him long letters, trying to prove to him that bits of paper were just as good as gold. The consequence was that the community saw its way clearly out of the slough. Those who failed began anew; those who had lost heavily worked harder and lived more economically. Nobody looked or thought of looking to Washington for relief. Even if the Congress of that day had been as poorly fitted to deal with financial questions as the present one, it would have escaped with less censure or observation, owing to the much smaller number of demands on it.

When the present Congress met, people, in view of all that has happened, looked to it for immediate and serious attempts, whether right or wrong in their conception, to deal with the financial problem. They would have pardoned delay, if it was plainly made in the interest of enquiry and deliberation. But they are naturally a good deal irritated to find the whole subject thrust aside to make way for that eminently unsavory subject, the "salary-grab," and to find even this discussed in the language and spirit of loafers at a corner-grocery, and to find under cover of it the brawlers of the House making their way, at the very opening of the session, into the leadership of the majority. Moreover, the interest which has been manifested in the subject is plainly inspired rather by a slavish fear of popular indignation than a real spirit of reform, and the proposed legislation is apparently dictated by a desire to save as much money for the new Congress as may be consistent with expressing popular censure on the old one.

What we mean by the disorganizing influence exerted by the Administration on public opinion, is rather more difficult to set forth within the space at our disposal. Our foreign relations, the army and navy, are subjects in which the popular interest is very slight, on which Congress and the public are for the most part very ready to acknowledge their lack of information, and which they readily leave to the management of men of special training, so far as they care about their management at all. Indeed, it would be no exaggeration to say, that as we have no army and no navy, it would be next to impossible to feel much interest in them. As regards foreign affairs, General Grant had the good fortune to provide himself with an adviser who was *primâ facie* well qualified for the place, and who has justified his selection by marked success in two very important crises. But then a very much worse selection would probably have satisfied the public—for the problems of our foreign relations are usually very simple, and the advice of acknowledged specialists can always be obtained on them. Whenever the Department of State finds itself puzzled on a question of international usage, it can obtain opinions from at least a dozen jurists whose decisions everybody will be disposed to bow to.

As regards the Treasury Department, now so closely connected with the banking and currency of the whole country, the state of things is widely different. Money matters are matters in which everybody is intensely interested. Currency is something about which nearly everybody, certainly every business man, thinks he is well informed. Almost any dealer in money or large vendor of goods feels himself fully competent to draw up a scheme for the regulation of the circulating medium. The fallacy of this belief has been again and again demonstrated. The currency question, almost as much as the tariff question, is pre-eminently a question of remote results. The immediate results of this or that measure anybody has wit enough to see; to follow it out to its ultimate consequences requires not only the habit of analysis and the capacity for protracted reflection, but thorough familiarity with the experience of mankind in this particular field of activity. Consequently, whether a man is an authority on currency depends largely on his mental training and ability. He may have dealt in money all his life, and be a financial dunderhead; he may have no experience in business, and be a financier of the highest order. Some of the most stupendous financial nonsense on record has been talked by merchants and bankers; some of the highest financial wisdom produced by men who had never been inside a counting-house. It is, however, none the less true that the ideal financier is a man with a trained brain and practical business experience, and who has "no axes to grind." But no matter what kind of man you take, you cannot make a financier of him if he disregards financial history. Principles of human nature form two-thirds of every financial problem. An ideal system of finance cannot be constructed without at the same time constructing an ideal man. So that the first and great question of finance is, Supposing we do this or that, how will men behave under it? Now, you cannot find out how they will behave either by mathematics, or metaphysics, or mechanics, or even astrology. You can only find out by history, by looking into the records of human experience, in order to discover whether your plan, or anything like it, was ever tried, and if so, what happened.

In these days, when so many people are talking finance, and the late Secretary of the Treasury makes a boast of caring nothing about financial history, it is interesting and instructive to go back a few years and see how a really great man prepared himself to deal with such problems as are now once again before the country. Said Daniel Webster, in Faneuil Hall, in 1842:

> "The subject of currency, gentlemen, has been the study of my life. Thirty years ago, a little before my entrance into the House of Representatives, the questions connected with a mixed currency, and restoring the proper relation of paper to specie, and the proper means of restricting an excessive issue of paper, came to be discussed by the most acute and well-disciplined understandings in England in Parliament. At that time, during the suspension of specie payments by the Bank, when paper was 15 per cent. below par, Mr. Vansittart presented his celebrated resolution, declaring that a bank-note was still worth the value expressed on its face; that the bank-note had not depreciated, but that the price of bullion had risen. Lord Liverpool and Lord Castlereagh espoused this view, opposed, as we know, by the close reasoning of Huskisson, the powerful logic of Horner, and the practical sagacity and common-sense of Alexander Baring, now Lord Ashburton. The study of these debates made me a bullionist. They convinced me that paper could not circulate safely in any country any longer than it was immediately redeemable at the place of its issue. Coming into Congress the very next year, or the next but one after, and finding the finances of the country in a most deplorable condition, I then and ever after devoted myself, in preference to all other topics, to the consideration of questions

relating to them. I believe I have read everything of value that has been published on those questions on either side of the Atlantic. I have studied by close observation the laws of paper, as they have exhibited themselves in this and other countries, from 1811 down to the present time."

When we contrast this preparation, to which one of the most powerful minds of the present century thought it necessary to subject itself in order to discuss finance, with the way in which our financiers at the present day take the matter up, we must admit that we have gone down the hill very rapidly. We have, in fact, got in this matter, as in some others, to what is called a "democratic basis"—that is, one on which everybody thinks he knows as much as anybody else. Instead of having one or two or a dozen men specially devoted to this question, and peculiarly competent to deal with it, charged with the preparation and carriage of measures designed to restore order to the national finances, we have a whole army of persons of all varieties of character and attainment busily engaged in discharging the duties of a Minister of Finance, the most modest and reticent of the lot being the Secretary of the Treasury. All presidents of national banks, all managers of savings-banks, all railroad presidents, all "bankers and brokers," all wholesale dry-goods men, all bond-pedlars, all members of Congress, are busily engaged in regulating the currency, and the President sets them the example of knowing all about it the minute he casts his eye on it. Neither Turgot, nor Huskisson, nor Horner, nor Hamilton, nor Webster, nor Gladstone ever wrote or spoke on any knotty point of national economy with half the assurance of the President's late remarkable letter on "silver resumption."

Now, what we complain of is that the Administration, instead of trying to educe order from this chaos by recognizing and promoting in its appointments the claims of study and experience, has used its influence to spread and perpetuate the idea that finance is one of those open questions which all men may approach with equal confidence, and with which any man can be made competent to deal by being clothed with office and a title. The first and most palpable result of this policy has been, of course, the installation of Messrs. Boutwell and Richardson in the Treasury; but another and not less unfortunate one has been the maintenance and perpetuation of the practice, begun in Congress soon after the war, of introducing financial bills as a mere expression of individual opinion, or in order to "show where the author stands." In a proper state of opinion, this would be too ridiculous and mischievous to last; but it is difficult to persuade any member of Congress that he does not know as much about currency as General Grant or Mr. Richardson. The consequence is that the attention of Congress and the country is confused by a multiplicity of schemes; the voice of thoughtful and skilful members is drowned in the noise made by the ignorant and reckless; and all consideration of any plan in particular, either in or out of doors, is rendered impossible. It is quite safe to say that until the country is "called to order" by some authority whom it respects, and in whose conclusions it sees reason to trust, a measure so serious, so full of inconvenience, whether real or fancied, to individuals, as a return to specie payments, will not be carried. We will take leave to add, too, that if the age of "leaders" be gone, more attention must be paid to elementary instruction in political economy in the public schools, if we are to escape great disasters hereafter. It is not simply a disgrace, but is likely to prove a serious danger to the nation, that children should be sent out into the world, in a complex commercial society like ours, in the condition of Mr. Pratt of Indiana, who thinks that by increasing the volume of the currency he can lower the rate of interest. In the presence of such a phenomenon as this, it is not wonderful that much of the current financial talk carries us back to the days when Jews were massacred for "carrying gold out of the kingdom."

THE CHIEF-JUSTICE OF THE UNITED STATES.

IT does not seem to be generally remembered that there was once a nomination for Chief-Justice of the United States rejected by the Senate; nor that the person so rejected was John Rutledge of South Carolina, a man as well esteemed there as Jefferson was in Virginia or Hamilton in New York; nor that the President who made the rejected nomination was Washington. On the 1st of July, 1795, the President wrote to Governor Rutledge, stating that he had on the previous day received the resignation of Chief-Justice Jay, and that Governor Rutledge's appointment would be immediately made. About the time that this reached Rutledge in Charleston, he also received news of Jay's treaty with Great Britain. Notwithstanding his judicial appointment, of which he was then aware, he attended a public meeting called for the purpose of denouncing the treaty, and not only joined in the denunciations, but cast many reproaches and sneers at the negotiator whom he had then in fact succeeded as Chief-Justice. Shortly after this he left Charleston for Philadelphia, and presided at the August term of the Supreme Court, and delivered at least one opinion. His conduct at Charleston was thought improper and indecorous, but the irritability which it caused seems to have subsided before Congress met. By that time, however, there were suspicions as to the mental condition of the Chief-Justice. In this day, the Washington correspondents would refer to them as rumors, which we should be informed a committee of the Senate had investigated in secret session and found groundless. At that day, the office was deemed of too much importance to be confided to any man to whom suspicions of any kind attached, however great his abilities and however eminent his patriotic services. Accordingly, on the 15th of December, 1795, the nomination of John Rutledge was rejected. There is, therefore, a precedent of the strongest kind, considering the personal eminence of both Washington and Rutledge, to sustain the Senate in exercising over every judicial appointment its right of scrutiny and its power of rejection.

It is also a matter of common belief that no associate Justice of the Supreme Court has ever been promoted to be Chief-Justice. This also is an error. During the absence of Jay abroad on his mission to negotiate a treaty, Mr. Justice Cushing had presided in his stead. After the rejection of Rutledge he was nominated to the Chief-Justiceship and unanimously confirmed. It is related that on the day when this occurred there was a large dinner-party at the President's, and the new Chief-Justice was one of the guests, though ignorant of his appointment. On entering the room Washington, from the head of the table, directing his look to him, said, in an emphatic tone, "The Chief-Justice of the United States will please take his seat on my right," and that the Judge was much affected at the announcement. His commission as Chief-Justice was made out and sent to him. He held it for about a week, and then determined, on the ground of ill health, to resign.

Considering the greatness of the office, there is, indeed, an anomaly about its early history in the frequency with which it became vacant. It was regarded as the second important office under the Government; Congress had fixed the compensation at about four times as much as the Congressional pay, equivalent in these days, judging by that standard, to $30,000 per annum; the tenure of office was for life; Jay, when offered by Washington any position which he might select under the Government, had chosen that of Chief-Justice; and yet in the first twelve years of the Government it was five times vacant and was marked by three resignations and one declination. The causes, however, do not indicate that the office was undervalued. Jay resigned because he believed that the people of New York were then peculiarly entitled to his services as Governor, and that patriotic disinterestedness required that he should give up a greater office for a lesser one. He had previously, in 1785, declined to be Governor of New York, while holding the inferior office of Secretary of Foreign Affairs under the Confederation, because he then thought no such necessity existed. Later, in 1801, when the reappointment of Chief-Justice was tendered to him, he declined because he had determined to retire from public life. Ellsworth, like Jay, was sent to negotiate a treaty while upon the bench, and like Cushing resigned because of ill health.

The men who have been called to the office of Chief-Justice

have always been men whose personal character was above suspicion or reproach, and who could lay claim to eminence either as judges or statesmen. Jay had been Chief-Justice and Governor of New York, a member of the Government under the Confederation, and distinguished in the Colonial Congress. He was indeed much more prominent at that day than he appears to us now to have been. The dignity and rectitude and liberality of his personal character doubtless invited confidence and respect. As we have seen, Washington's confidence in him was so great that he not only appointed him Chief-Justice, but, taking him as the first of the great men of the day—before Jefferson and Hamilton—tendered him any place which he might prefer to serve in. Rutledge's services during the Revolution are a part of the history of the country. But of him we need hardly speak, as his appointment was rejected. Cushing had been a judge from a period anterior to the Revolution, Chief-Justice of Massachusetts, and presiding Justice of the Supreme Court of the United States. Ellsworth had been prominent among the framers of the Constitution, a judge in Connecticut, chairman of the Judiciary Committee of the Senate, and at the time of his appointment was spoken of by John Adams as "the firmest pillar of the whole Administration in the Senate." Of Marshall, the greatest of American judges, it is needless to speak. It is enough to say that these were the men that the office was deemed to require during the official days of Washington and Adams. Since those days, neither the dignity nor the importance of the office has declined, and its labors have been very greatly augmented.

But apart from all historic precedent, and the cherished examples of the "fathers," whose wisdom and rectitude are still guides which it is ordinarily safe to follow, this office of Chief-Justice of the United States is not one that the American people can easily suffer to fall into unworthy hands. If there be any characteristic of our Constitution which has been lauded and believed in at home, and studied and respected abroad, it is the lofty and independent plane upon which it has placed the judiciary of the United States. Unlike the chief officers of state, the judges hold office for life. Unlike other appointed officers, they are not removable at will. A tardy and uncertain proceeding, in the nature of a criminal conviction, can alone remove them from office, and as it was intended for offences little short of crimes and misdemeanors, it cannot be employed against ordinary unfitness, passable ignorance and narrow-mindedness, suspected partiality, and suspicious antecedents and associates. The office may fall immeasurably in public estimation and moral usefulness through the shortcomings of the incumbent, and yet the nation be without a remedy through his whole lifetime. Certainly there was never a people who so needed irreproachable character in their chief judicial officer, nor who could so justly demand of their appointing power a fearless and exacting scrutiny. The ordinary political crimes of giving us bad officials to waste our resources, or rob us of our money, are trivial compared to that of passing a suspected person up to the bench of our highest court.

But even at this point one should not stop to estimate the importance of the office. Besides this independence of the individual judge, there is also to be considered the singular independence and power within its own sphere of the judicial department of the Government. What other judicial system has the power to declare void the acts of the executive and the laws of the legislature? Standing as it does between the Government and the citizen, between the General Government and the States, and even between the several States in the character of a supreme arbiter for each, it participates in the most vital affairs of Government to an extent and in a manner which no other judicial system approaches. And as many of the questions with which it has to deal are of a gravity which far exceeds those which come before mere courts of law, so they are of a nature which cannot be determined by mere legal precedents. In other words, the bench of the Supreme Court requires a breadth of intellect and general culture and comprehensive learning much above the ability that will carry a mere lawyer over his routine with credit. If we have great men who are also able lawyers, the Supreme Court is the department of the Government which peculiarly demands them.

The means appointed by the Constitution for the selection of the judiciary are in one sense peculiar. The executive and the legislature are chosen directly or indirectly by the people; but because the people might err in the choice, the duration of their offices is short. But inasmuch as the judiciary hold office for life, it was designed that there should be no mistakes in their selection. Especially should there be no mistake in the matter of personal character and integrity. Never was there a time when a people could better appreciate the difference between morally good and bad judges. In public estimation, the Chief-Justice of the United States must be above suspicion. It is not enough that senatorial committees, sitting with closed doors, declare charges unsustained and rumors unfounded. Rumors and suspicions may be unfounded and unjust, but while we may all deplore the injustice, we must all insist that a place so exalted shall be filled by an untainted character. It is not enough that the man chosen to be Chief-Justice be really good; he must be so free from evil that all of his countrymen believe him to be irreproachable.

AGRIPPA D'AUBIGNÉ.

PARIS, December 4.

IT is not easy to form a complete collection of the original works of Agrippa d'Aubigné. The Catholic movement which followed the abjuration of Henri IV., and the gradual decay of the Protestant cause, consigned d'Aubigné almost to oblivion. He is not often mentioned in the historical works which were written after the Revocation of the Edict of Nantes. His wild and unruly spirit was little in accordance either with the serenity of the *grand siècle* or with the light graces of the eighteenth century. Our time has been more just to him, and the resurrection of d'Aubigné must be chiefly attributed to the intelligent praise of Sainte-Beuve. The eminent critic saw at once, when he took the pains to go over the folios of the author of the 'Histoire Universelle,' that d'Aubigné did not belong to the second class of respectable writers, who form the great army of letters; that he was a commanding genius, as a poet, as a historian, as a man. I was able to procure Sainte-Beuve's own copy of the first edition of the 'Histoire Universelle,' printed under the eyes of d'Aubigné at his chateau of Maillé. The well-known signature of Sainte-Beuve is on the title-page, and I found paper marks between the leaves, which certainly were placed there by the hand of the great critic, as they all marked remarkable passages.

D'Aubigné had been educated somewhat like Stuart Mill; at the age of seven he translated the 'Crito' of Plato. But his classical education was interrupted somewhat by the civil wars. When he was eight years old, he followed his father to Paris on horseback, and, going through Amboise, he saw the heads of some Huguenots on spikes: "They have decapitated France, the murderers!" exclaimed his father, who put his hand on his head and said to him: "My child, you must not spare your own head, nor will I mine, to avenge these honorable chiefs; if you do, you will have my malediction." These details are found in d'Aubigné's own life, written by himself for his children. His other works, which are well known to all scholars, are the 'Tragic Poems,' the 'Adventures of the Baron de Fœneste,' the 'Satires,' the 'Confession of Sancy.' It is not easy to translate the old-fashioned and quaint style of d'Aubigné. Let us choose, for instance, this passage, marked by Sainte-Beuve. Admiral Coligny is in bed with his wife; he is waked up by her sobs, and she addresses him thus:

"It is with great regret, sir, that I disturb your peace by my inquietude; but the members of Christ being torn as they are [it was at the beginning of the persecutions against the Protestants], and we belonging to his body, what part of it can remain insensible? You, sir, have not less feeling than I, but more force to conceal it. Here we are in a luxurious bed, while our brothers—the flesh of our flesh and the bone of our bone—are some in prison, some in the fields at the mercy of the dogs and vultures. This bed seems a grave to me, since they have no grave; these sheets tell me that they have no shrouds. I was recalling the prudent speeches by which you shut the mouths of your brothers; will you also tear their hearts, and have them remain without courage as well as without speech? I fear lest this prudence be that of the children of the century, and so much worldly wisdom not be wisdom in the eyes of God, who gave you the science of a great captain. Can you in conscience refuse to use it for His children? The sword of a knight which you wear, ought it to oppress the afflicted or to tear them from the claws of tyrants? . . . Sir, I have on my heart the blood of so many of ours; this blood and your wife scream before God and in this bed against you, and tell you that you will be the murderer of those whom you will not hinder from being murdered."

There is in this passage something quite Corneillian; you feel in every word

the energy of the sixteenth century. D'Aubigné's characteristic is, above all, energy; there is force, and almost brutality, in his poetry, and even in his wit. He will ever remain one of the most remarkable writers of that period when the French language was in process of formation, when it was more unruly, more individual. It was therefore a happy idea to begin, what had never been done before, a complete edition of his works. The first volume has only just appeared in that magnificent collection of the French classics which is edited by Alphonse Lemerre. To those who cannot procure the original editions, and even to the happy bibliophiles who have them, I cannot recommend enough the volumes already published of La Bruyère, of Rabelais, of Montaigne. D'Aubigné's works will form five volumes; the first contains a great quantity of matter entirely novel. It was known that many manuscripts of d'Aubigné were still unpublished. They were kept in Switzerland in the Tronchin Library. M. Merle D'Aubigné, the author of 'The History of the Reformation in Europe,' thought at one time of publishing all the writings of his ancestor; but his old age and the necessity of finishing his own work precluded him from entering into this new enterprise. M. Eugène Réaume has been admitted to the Tronchin Library with M. Caussade, and they have copied all that was worth copying in the enormous correspondence found at the Castle of Bessinges. They have also put under contribution the libraries of the Duc de la Trémoille, of the Duc de Noailles, who has all the relics of Madame de Maintenon (who was, as is well known, the grand-daughter of d'Aubigné). The unpublished works which they offer now to the literary world are: A book of military missives and speeches; memoirs on state matters; correspondence on personal affairs; familiar letters; letters on points of science and of theology; four treatises on political or religious subjects—1. Instructions and salutary advice to princes, republics, and peoples; 2. Treatise on civil wars; 3. On the mutual duties of kings and nations; 4. The Caduceum, or the angel of peace. There are, besides, an allegorical novel and unpublished poems. Most of the familiar letters have, alas! disappeared, and it seems that of all these manuscripts many had been condemned by d'Aubigné to destruction. "Ure, seca," were his own words to his executors in his will. They never obeyed him, and all the papers have been found in the greatest confusion. He never himself attached much importance to any of his works, except his great 'History,' which he proudly dedicated to posterity.

Here is an extract from one of the familiar letters, which will show the pervading spirit of the Huguenot gentry. The Duc d'Epernon had been much offended by an allusion to him made in the 'Tragiques':

"A gentleman said to me after dinner: 'We saw yesterday M. d'Epernon very angry against you, and saying before two hundred gentlemen that if he could not see you otherwise, he would invite you to see him in a field with one of the best swords of the world.' I shrugged my shoulders and smiled, but his companion having repeated the same thing, I felt obliged to add: 'I have been bred in too good a place not to know what the advantages are of dukes and peers; but if his Highness absolutely ordered me, and if you in his name asked me to go to that field, he would be promptly obeyed.' One of them answered: 'Sir, there are qualities of which he cannot divest himself, and, besides, he is surrounded by so many lords and gentlemen that he could only clear the field (*assurer le pré*) with difficulty.' I ended the conversation thus: 'Gentlemen, we do in France what we wish with our acquisitions. The Duke by birth is nothing above me, and many princes—witness the Duc de Guise—lay aside their dignities from excess of courage; and as for clearing the field, I can do that myself, even if the field is in his government.'"

This was strong language, but the man who never spared the truth to Henri IV. was not likely to tremble before the Duc d'Epernon.

In the series of letters united under the name of "Letters of State," we see d'Aubigné in correspondence with the Duc de Rohan, with the Duc de Bouillon, with the "most honored Lords of Berne," with the Venetian Ambassador, with the Prince de Condé. In the collection of the "Letters on Points of Science," we meet with many proofs of the terrible ignorance of the most cultivated men of the period of Henri IV. There is a long letter among others, addressed to M. de la Rivière, the first doctor of the king, on the question of sorcery, which is very extraordinary. "It would be," says d'Aubigné, "a great iniquity to believe that the Scriptures, in which there is nothing vain, had spoken in vain against sorcerers and enchanters; it would be a mortal and pernicious error." He then explains that the sorcerers ought to be brought under the jurisdiction of very high and learned courts. Among the stories he tells, and which give a vivid idea of those times, is this: After the last civil wars, says he, France was afflicted with a plague called "la masle beste." Two hundred thousand persons died of it; the wolves were entering the houses to devour the children. The populace believed in enchanted wolves, called *loups garous*. "It happened that near Chemillé there was found in a ditch a horrid man, with a furious look, bloody hands, and a bloody mouth. He had by him a little child, the entrails of which had been devoured. They asked him who had eaten the child; he said that he had himself." In court, he confessed having eaten many other children, and finally it was proved that he had eaten none; that he had found a child dead, and had touched him; he was mad, that was all his crime. But if it had not been for the judge, who conducted the examination with great care, the unfortunate madman would probably have been condemned to some *exquisitum supplicium*. D'Aubigné cites the case of a girl who, after a sermon on sorcery, went to a judge and confessed herself a sorceress. The First President prepared himself for the trial by reading the 'Demonomania' of Bodin, and other books of this sort. D'Aubigné describes the girl as very handsome, with a candid expression, and an immovable countenance. They asked her, "In what state do you go, or do you think you go to the Sabbath, in body or in spirit?" 'To the Great Sabbath, which is very distant, we only go in spirit; to the near ones in body." "You think so, but it might be all imagination?" "I will prove to you that it is not. Ten days ago we held a Sabbath in such a village, in such a one's barn; the Master ordered such and such and me to go and get the son of Jane in such a place, who had been buried on that day. He was brought on the table, and divided between twenty-four persons. I remember thirty places where the remains were taken." Commissioners were sent, and many small bones of a child were found in these places. This trial, says d'Aubigné, caused the execution of thirty-four persons; the girl witnessed them all, with a cord round her neck, much regretting not to die also, as she had, she said, been taken since the age of nine years to the Devil's Sabbath.

There are also curious letters upon philtres, upon all the superstitions of a very superstitious time. These scientific, or rather unscientific, letters seem to me perhaps the most curious part of the inedited portion of this first volume, which will soon be followed by the well-known 'History' and the other works of d'Aubigné, with such additions and changes as have been found necessary after the inspection of the numerous manuscripts of the Tronchin library.

Correspondence.

THE CHIEF-JUSTICESHIP.

To the Editor of the Nation:

Sir: Like your correspondent "T. H.," whose letter appears in the *Nation* of last week, I was much suprised at the apologetic tone assumed by you in speaking of the nomination to the Chief-Justiceship. By the members of the Bar of the Supreme Court, who are acquainted with Mr. Williams's capacity, his nomination is considered as simply disgraceful. With such men to choose from as Swayne and Miller upon the Supreme bench, Woodruff and Emmons upon the Circuit, and Curtis, Evarts, and Cushing at the bar, the appointment of Mr. Williams would be positively disheartening to those who are endeavoring to effect the abolition of the elective system in the States where it now obtains. It is all the more suprising, too, from the usually fortunate selections made by President Grant for judicial offices, and can only be justified upon the theory that those who are likely to know Mr. Williams best have totally misapprehended his fitness for the place. S. T. W.

Detroit, Dec. 15.

INFLATION NO CHILD'S PLAY.

To the Editor of the Nation:

Sir: This is a true story. Once upon a time (after the passage of the Legal-tender Act), as I was walking in a friend's garden, I came upon a summer-house where two little children were playing at keeping shop. Their merchandise was of little intrinsic value, but their currency was still more worthless, for it consisted of pieces of old newspaper. Having some confidence in my own knowledge of finance, I said, with a smile, "Children, you cannot play that game long, for one of you has only to tear up a few more old newspapers and he can buy the other out in no time." "Oh!" said the children, both together, "we ain't so silly as you think; before we began to play we agreed just how much newspaper we would have." Now, those little children played that game out honestly, and they didn't water *their* currency a bit.

Will not the *Nation* review this story, and recommend it as good reading for members of Congress during the Christmas holidays? And oblige, yours respectfully, X.

ENGLISH WATER-COLOR ART.

To the Editor of the Nation:

Sir: A paper has been circulated through art-circles in this country containing a copious extract from the *Nation*, in which the use of gouache is spoken lightly of, and its use deprecated from its alleged want of permanency; and

as English water-colors have been publicly exhibited of late in New York, and a favorable reception accorded to them (as representing a school without a rival and enjoying an European reputation), may I be permitted to assist in removing the erroneous impression which exists in reference to the body-color element, and so endeavor to destroy the fulcrum by the aid of which you overturn those works which have been completed, and their salient points touched in, with this material?

You say: "A few magisterial touches of body-color, which, as we are taught, may turn black in the course of a few years." May I explain that the first use of white seventy or eighty years ago was neither more nor less than chalk, with sufficient admixture of gum to make it adhere? A few years later, preparations of lead succeeded, and the rash use of this material, which did turn black in the course of a few years, and brought very naturally opprobrium on the very name of body-color, is the obvious reason why it has earned an unfortunate reputation. Every chemist must condemn the use of this material with its leaden basis, and it is no longer manufactured. To this succeeded a preparation of oxide of zinc, which proved to be in all respects permanent; but from having a somewhat pasty texture, rising in unseemly ridges on each side of the brush mark, it soon ran its race, to be succeeded by sulphate of barytes, which gives the water-color artist all he can desire, working most agreeably, thoroughly opaque and unchangeable. It was first largely used by J. D. Harding, but not until its properties had been severely tested by Michael Faraday. Mr. Harding asked him, after his tests had been applied, "if it would last for ever"? Faraday said, "For ever is a long day, but you may rely on its lasting to all eternity, and a thousand years afterward." Will this satisfy those carpers who with long aces declare, as they may truly do of a consumptive patient, that "he is not long for this world"? I have many drawings by my colleagues of thirty to thirty-five years' standing where the white is as pure as the driven snow, and where not an approach to change is discernible; and we look upon a body-color work as specially protected from decay when the paper is covered with the panoply of body-color.

Having thus made known the opinion of our greatest analyst—an opinion sustained by the experience which revealing years brings to our aid—I fully concede all that you say in reference to the prodigal use of this material. Like all stimulants, it may be so often employed as to neutralize itself; and water-colors' *spécialité*—which is transparency and atmosphere—may be merged when too free use has been made of the bottle of white. Let our American friends persevere in the effort to exhibit the pure white "Whatman" paper—it is a laudable struggle, and one which will repay them in the end—and abstain as much as possible from the prodigal use of a material which, if indulged in, will fail to reach the power of oil, while the freshness of water-color work will be endangered. At the same time, if opaque color is wrong, so must be semi-opaque colors, and these include cobalt, vermilion, emerald green, and the various ochres. There can be no doubt but that the cautious and sparing use of this material in the foreground will greatly enhance the atmospheric tints obtainable only by the use of transparent colors.

I have the honor to be, sir, your obedient servant,

COLLINGWOOD SMITH,

Treasurer of the Society of Painters in Water-Colors.

WYNDHAM LODGE, BRIXTON HILL, LONDON, November 17, 1873.

Notes.

THE fifth 'Circular of Information' of the Bureau of Education is an account of college commencements during 1873 in the Western and Southern States—in fact, a continuation of Circular No. 3. The appendix sums up the degrees conferred by the institutions mentioned in both circulars, and the benefactions made to them. The A.B.s number 1,861, the M.D.s 503, the LL.B.s 504; while the bachelors of science make the respectable showing of 486. The total donations and legacies, absolute, pledged, and conditional, for the year 1872-73, are valued at £4,216,886. At the close of the present year the Bureau proposes to issue a title-page, general index, and introduction to its circulars, which have been paged accordingly.——St. George Mivart's newest work on 'Man and Apes: an Exposition of Structural Resemblances and Differences bearing upon Questions of Affinity and Origin,' will be republished here by the Appletons.——G. P. Putnam's Sons have reproduced for Mrs. Eliza Greatorex six pen-and-ink etchings made by her in Nuremberg, chiefly commemorative of Albert Dürer. The printing has been done by photolithography (the *Graphic* process) with a result probably not far short of the original rendering, but less effective, we should suppose, than copperplate impressions would have been. The sketches, from well-chosen points of view, are interesting in themselves and gracefully executed.

—"Manning the Navy" was the subject of an address delivered by Capt. Stephen B. Luce, U.S.N., before the U. S. Naval Association at Annapolis, Nov. 13. Captain Luce has no fault to find with the "settled, well-established policy of our Government to maintain but a comparatively small standing army and a small navy, relying upon the patriotism of our people to swell either indefinitely, as may be needed." He complains, however, that while in the case of the army this policy has been supplemented by a special provision for reserves, no such provision has been made—or, rather, made to operate—for the navy. As a result, "our national ships are only partially manned by American seamen," and, indeed, "the greater part of the men who man our naval guns are foreigners." Secretary Welles stated in one of his reports during the rebellion, "while we were straining every nerve to get seamen, that we had in the navy 19,000 landsmen." These facts are sufficiently discouraging, but they do not appeal to the popular imagination until such a crisis is upon us as that from which diplomacy has just rescued us. "To establish a school of seamen for the navy alone, however," says Captain Luce, "would be as unwise as illiberal and short-sighted. Any scheme for the benefit of our seamen must include all, both those of the national and those of the commercial marine." The revival at this time of our shipping interests naturally favors the introduction of a general system of nautical education, and, in fact, the State of New York has already provided, in a statute passed last year, for the establishment and maintenance of "a nautical school for the education and training of pupils in the science and practice of navigation." Captain Luce has accordingly prepared a bill for submission to the present Congress, based upon the experience of England and France, as described in an interesting manner in the body of his address. Since it would be "unadvisable to open nautical schools in the absence of a positive and active demand for the kind of education they are alone intended to supply," the bill seeks "to create that demand by establishing, by legislative enactment, a fixed standard of professional attainment on the part of the masters and mates of our merchant service, and by requiring our merchant-vessels to take, as a part of their crew, duly qualified sailor-boys in numbers proportioned to their tonnage." In answer to a question of Commander Breese, Captain Luce said: "The first thing for us to do is to get Congress to give us an allowance of at least one thousand boys over and above our present complement of seamen; the act, in granting them, to specify that they are to be trained for the purpose of being seamen and petty officers in the navy; and at least three vessels should be commissioned in our principal ports for the purpose of carrying out the provisions of the act." The act also "provides for the appointment of a registrar of seamen, to keep, in addition to other prescribed duties, an account of the seamen of the country, that we may have at all times some knowledge of the auxiliary sea-force on which the country may rely in the event of war."

—The necessity of adopting some such plan as this is so apparent that we shall only express the hope that Congress may give it the attention it deserves, and that without delay. It should be borne in mind, however, that the lack of seamen is not peculiar to this country, and the causes of this deficiency merit a careful examination. At the very time Captain Luce was preparing and delivering his address, the Nautical Association of Bremen were deploring the prevalence of the same evil in all the ports of Germany. It was stated at one of their meetings that the number of Bremen crews had increased in ten years by about 25 per cent., while the number of sailors had remained nearly constant (1,500 to 1,600), and there was a marked falling-off in sailor-boys. This was traced to several causes: the actual deficiency of men in Germany; the decline of fisheries; the inequality between seamen's wages and landsmen's; the hardships of the sailor's condition. Unquestionably the last two are everywhere the most potent factors of the problem. The laborer and the mechanic have no need to envy the sailor his gains or his lot. They earn more with less risk, and they are better protected against the caprice and inhumanity of their employers. Captain Luce calls attention to the bad name acquired by the American merchant-service for sheer brutality in the treatment of the men before the mast; and he might have added that our navy has furnished examples of cruel and unnatural punishments equally disgraceful to the national character. Moreover, the introduction of steam has worked adversely to good seamanship, by offering better wages and better treatment, while exacting less skill in navigation from the common sailor. Yet it is perfectly true, as Captain Luce remarks, that "to command an ocean steamer properly, one must first be a sailor; and a sailor can be made only on board of a sailing-ship." We may note that the Bremen Association declined to pass a resolution in favor of compelling shipmasters to take

a certain number of boys (Schiffsjungenzwang), partly on the ground of its impracticability, owing to the want of boys.

—We have already made reference to an entertaining writer in the *Cornhill*, who has had for his theme the history of the French newspaper press from its origin to the present time. In his latest article he deals with contemporary journals and journalists, and, after a fashion to which he is no stranger, he begins with a small Gallico-philosophical excursus, in which he enquires into the reason why every newspaper press in the world does the French press the honor of paying it more attention than any other. This we suppose we may allow to pass for a fact. The fact being so, it is so for the same reason, he says, that each nation outside of France pays more attention to the French nation than to any other except itself; and this is a reason not hard to find. The Frenchman thinks he has found it when he says that it is because the French are the leaders of human thought in all its fields. But this, says our author, is a conclusion which has no great amount of truth in it. Frenchmen are great adapters and magnifiers of other men's ideas: that must be admitted; but it cannot be said of their genius that it is at all of the inventive kind. For instance, their communist right of local self-government, about which we have lately heard so much, has for centuries been an old story in Britain, and has long been exercised by Americans also; and the same may be said of "all that is practical in their political theories." But it is not only in political contrivances of a practical nature that the French are secondary; the same thing happens to them everywhere. Their famous schools of revolutionary philosophy, for example, were made up of nothing else than disciples of the rationalism of Hobbes and Locke; and of their celebrated Encyclopædists it may indeed be said, that as their writings were directed against Rome and the Jesuits rather than against fundamental dogmas, the authors of them may be described as mere continuers of the Reformation. Undoubtedly, it may be urged that France has at least immense military glory, and a moral influence extending far beyond the confines of her territory; "but these again are catch phrases, which do not bear a very close examination." As for the military glory of France, "before Napoleon, who was a Corsican, vanquished the armies of disunited and distracted Germany," French military annals offered a long series of such crushing defeats as Crécy, Poictiers, Agincourt, Pavia, Blenheim, Ramillies, Malplaquet, Oudenarde, and Rossbach, and few decisive or useful successes. As for the moral influence of France, the French Shakespeare, Dante, Raphael, Beethoven, Michael Angelo, are sought in vain; and while the Englishman can point to his institutions and language thriving over a third of the world, the Frenchman of our day can point to no colony but Algeria, and there to little more than garrisons. In short, Mr. Matthew Arnold's verse—

"France, great in all things, but supreme in none"—

would seem likely to secure this essayist's fullest approbation; and doubtless he would dissent from the proposition that to be great in all things is of itself a kind of supremacy, and is to be acknowledged as such.

—Having made out to his own satisfaction that the French are not leaders of human thought—in the sense, at any rate, of being the greatest originators of thought, however else their claim might plausibly be urged—the *Cornhill* writer answers his own query in his own way, his answer being, in brief, that France is the spoiled child of Europe: no other people respects her very much; all like her and are amused by her. And this because Frenchmen themselves live for amusement—avow that fact to themselves, do not set themselves up for anything else than sinners, are no hypocrites, and, in short, fill the position among other nations that is filled in private circles by those merry, bright-witted rakes who do and say with impunity what would not be allowed in the case of steadier persons, and yet what these steadier persons do not dislike to hear said and see done, though dignity—perhaps something worse—may prevent their doing it themselves. This, it will be seen, may pass very well for magazine disquisition upon "national character"—a species of writing in which all sorts of philosophers have at one time and another engaged, and in which even the best of them are more ready to remember the points of difference between different nations than to remember the points of likeness between two communities of human beings who may happen to be living under somewhat different circumstances. It is thus that we get not only the gay Frenchman of the old-school geographers, who always straps down his trowsers and eats ices in *cafés*, but also the democratic American, always being democratic, of M. de Tocqueville. But however profound our *Cornhill* essayist may be in his philosophy, he is readable when he comes to draw portraits of his contemporary editors, among whom are M. John Lemoinne, M. Edouard Hervé, M. Louis Veuillot, M. Ernest Renan, M. Louis Blanc, M. Emile Girardin, M. Francesque Sarcey, M. Clément Duvernois, M. J. J. Weiss, M. Henri de Pène, M. Paul de Cassagnac, M. "Timothée Trimm," and a dozen more. The writer appears to know some of these gentlemen, and to know about all of them and treats of them all as if he had in a measure got over his feeling of amusement at them as "foreigners." Still, no true Englishman will be displeased at the tone of his writing, and M. de Cassagnac—whom he pronounces diffuse in style, but a good fencer—may even now be preparing to do himself the pleasure of a meeting with him.

SARA COLERIDGE.*

IN his poem called the "Triad," which is full of exquisite touches of refined and delicate fancy, Wordsworth, after describing his daughter Dora and Edith Southey, thus depicts Sara Coleridge, the daughter of the poet, as she was in her twenty-seventh year:

"'Last of the three, though eldest born,
Reveal thyself like pensive Morn
Touched by the skylark's earliest note,
Ere humbler gladness be afloat.
But whether in the semblance drest
Of Dawn, or Eve, fair vision of the west,
Come with each anxious hope subdued
By woman's gentle fortitude,
Each grief, through meekness, settling into rest.
—Or I would hail thee when some high-wrought page
Of a closed volume lingering in thy hand
Has raised thy spirit to a peaceful stand
Among the glories of a happier age.'

"Her brow hath opened on me—see it there,
Brightening the umbrage of her hair!
So gleams the crescent moon, that loves
To be descried through shady groves.
Tenderest bloom is on her cheek;
Wish not for a richer streak;
Nor dread the depth of meditative eye,
But let thy love, upon that azure field
Of thoughtfulness and beauty, yield
Its homage offered up in purity.
What wouldst thou more? In sunny glade,
Or under leaves of thickest shade,
Was such a stillness e'er diffused
Since earth grew calm while angels mused?
Softly she treads, as if her foot were loth
To crush the mountain dew-drops—soon to melt
On the flower's breast; as if she felt
That flowers themselves, whate'er their hue,
With all their fragrance, all their glistening,
Call to the heart for inward listening."

It were an infelicity that might well awaken a sentimental regret should so lovely a poetic image as this be changed into a plain figure of mere prose. And this is, alas! the effect, in spite of many elements of sweetness and superior excellence, of the 'Memoir and Letters of Sara Coleridge.' The interest of the book, such as it is, lies not in the incidents of the life, but in the expression it affords of the character of a woman of some uncommon intellectual gifts and some personal accomplishments and graces.

Sara Coleridge was born in 1802, the fourth and youngest child of Coleridge's ill-mated marriage. She was born at her uncle Southey's house, at Keswick, in the absence of her father. Her childhood and youth were spent under the same roof and under the guardianship of Southey, who, with all tenderness and faithfulness, supplied the place of her own irresponsible, neglectful, and selfish father. From him, however, his daughter inherited the most marked traits of her nature, and for him she entertained a pathetic reverence. It is to Southey's highest credit that such a feeling as possessed Sara Coleridge's heart toward her father was possible to her. Any one of less generosity than Southey would have hindered the growth of the sentiment, not necessarily by open expression, but almost inevitably by the indication in general moral judgments of the contempt which such a course of life as Coleridge pursued could not but awaken in an upright and conscientious man. Inheriting from her father a sensitive organization, an imaginative temperament, a reflective disposition, Sara Coleridge was fitted by nature to receive easily the impress of the literary influences which surrounded her. To Southey and Wordsworth she owed the best part of her education. In the intercourse of domesticity with them, she learned to live simply and to think highly. She was early a student, early fond of serious meditation; and while her life moved in quiet paths, her soul was filled with interests that are seldom the concern of girls. In 1822, she became engaged to her cousin, Henry Nelson Coleridge—a man not unworthy of her. They were not married till 1829. In 1843, her husband died. Their married life had been what is called happy, except for the interruptions and anxieties of ill-health. She had been occupied with the care of her children and with literary interests, for which her taste continued to increase. After her husband's death, she continued to devote herself to her children, and she gave much time and thought to the editing of her father's works. Her health, which always had been delicate, broke down in 1851, and she died on the 3d of May, 1852, in the forty-ninth year of her age.

Upon this framework of fact her life was built up. She left a very precious

* 'Memoir and Letters of Sara Coleridge. Edited by her Daughter.' New York: Harper & Brothers. 1874. Cr. 8vo, pp. xxxi-⁂.

memory to a small circle of intimate friends. She had made a strong impression of high intellectual powers upon a larger, but still small, section of the public, and to the numbers who knew only her name, she was of interest as the daughter of Coleridge, the niece of Southey, the friend of Wordsworth—a creature of the imagination worthy of these associations. Mr. De Vere, in a letter to her daughter, printed in this volume, says:

"Great and various as were your mother's talents, it was not from them that she derived what was special to her. It was from the degree in which she had inherited the feminine portion of genius. She had a keener appreciation of what was highest and most original in thought than of subjects nearer the range of ordinary intellects. She moved with the lightest step when she moved over the loftiest ground. Her 'feet were beautiful on the mountain-tops' of ideal thought. In this respect, I should suppose she must have differed from almost all women whom we associate with literature. I remember hearing her say that she hardly considered herself to be a woman 'of letters.' She felt herself more at ease when musing on the mysteries of the soul, or discussing the most arduous speculations of philosophy and theology, than when dealing with the humbler topics of literature."

And it is in accordance with this discriminating statement that Sara Coleridge's chief claim to remembrance in connection with literature lies in the essays and notes, mainly on controverted topics of theology and metaphysics, with which she illustrated the editions of her father's works that she superintended. They display learning rare in a woman, as well as a considerable power of speculation and of skill in dealing with the terms and propositions of metaphysics. But she had inherited from her father the tendency to over-refinement and subtlety rather than clearness of thought, and she had adopted from him his mode of speculation, in which baseless assumptions are often made to do the duty of sound arguments, and to serve as substructure for the most lofty but unsubstantial edifices of fancy. Coleridge had the faculty of deceiving himself with the notion that he was thinking, when in truth he was dissipating his intellectual energies in the practice of the mere form without the substance of thought. This faculty was helped by his tendency to mysticism, and by his adoption of an unintelligible scheme of theology. Nothing impresses a certain class of minds more effectively than the self-confidence of an inaccurate thinker, especially if it be united, as in Coleridge's case, with great powers of expression, gleams of true insight, and a highly poetic genius. His daughter became one of his most thorough disciples. Her affection, which had found little opportunity for expression in personal relations with her neglectful parent, her pride in his repute, and her inheritance of intellectual tendencies and sympathies, seem gradually to have shaped her mind upon the model of his. But it was the speculative, more than the imaginative and poetic, side of his nature that was reflected by hers. And that portion of his speculations was specially attractive to her in which he attempted to build up a system of evangelical theology upon a curiously ingenious and complex metaphysical basis. The more important letters in the volume before us are metaphysico-theological discussions, in which the cut-and-dry formulas of the evangelical school have a large place. The letters show an admirable temper and spirit, reveal a very pure and pious soul, but are dreary expositions of a scheme which, in the effort to reconcile philosophy with the creed of a narrow party of a single church, resulted in an unsatisfactory and lifeless compound of formalism and mysticism.

The chief impression left by the letters is that Sara Coleridge's existence was far too much intellectualized. The sweet feminine soul was starved by the claims of the restless and dissatisfied intelligence. Her letters, even those to her husband, take the form of essays; they want the grace of easy friendly communication. She is always a little conscious of being seated in the lecturer's chair, and what she has to say must, to our regret, turn out at times, if not tedious, at least commonplace. Her notion of letter-writing is given by herself in a letter to a friend, and the passage is characteristic of her manner. "Letter-writing," she says, "is a method of visiting our friends in their absence, and one which has some advantages peculiar to itself; for persons who have any seriousness of character at all endeavor to put the better part of their mind upon paper; and letter-writing is one of the many calls which life affords to put our minds in order, the salutary effect of which is obvious" (p. 159).

What memories of delightful letters of women who were not always putting their minds in order, however salutary might be the process, rise to the thought—letters in which the heart, the fancy, the playful wit, the delicate observation, the exquisite expression, all have share! It is with a smile, but with a smile that does not exclude a tender, pathetic sense of the incomplete life of a woman who could write in this fashion to her husband, that we read such a passage as the following: "We ought, indeed, my beloved husband, to be conscious of our blessings, for we are better off than all below us, perhaps than almost all above us. The great art of life, especially for persons of our age, who are leaving the vale of youth behind us, just lingering still perhaps in the latter stage of it, and seeing the bright golden fields at the entrance of it more distinctly than those nearer to our present station, is to cultivate the love of doing good and promoting the interests of others, avoiding at the same time," etc., etc. (p. 179). We cannot quote more. It is too hard to see the ideal Sara Coleridge of the "Triad" thus changing into a figure as stiff and unattractive as one of Mrs. Jarley's wax-works.

A touch, a look, a single brief expression, may afford the measure of a character more truly than long speech or usual habit. The gesture, the glance, betray the inner recesses of the soul. The following sentences are extraordinary revelations of the writer's character. We will not qualify them with the epithet they deserve. She is writing to Mr. De Vere, concerning Dante:

"Don't you observe how much less of sturdy, independent pride and reserve there is in Italians, and in all foreigners, than in us Englishmen? An English poet would not have written this of himself—he would have thought it babyish; and still more much of Dante's behavior with Beatrice, which I have always thought has a touch of Jerry Sneak in it. Indeed, he actually compares himself to a baby fixing its eyes on its ma" (p. 457).

Failure of perception, blankness of mind, absence of feeling, could hardly find more absolute expression than in these words. There are happily better things than this in the book: some pleasing reflections, some natural feeling, some fair criticism. But the general effect of the volume is one of disappointment. Sara Coleridge is no longer a creature for the imagination to delight in. She will remain of interest as the daughter of the poet, more than by her own right. These letters show her to us as a serious-minded, good woman, with unusual intellectual powers, and with personal graces that attracted a narrow circle of friends. But of the woman complete in all sweet feminine gifts and charms, free from self-consciousness, free from dogmatism and vanity, with feelings unformalized by creed or theory, with a deep and simple heart, of such a woman the traces are slight in the 'Memoir and Letters of Sara Coleridge.'

JACQUEMART'S CERAMIC ART.*

THIS handsome volume is almost exactly reproduced, except as to the cover, from the French original which appeared a year ago. Within, the pages are nearly of the same size and appearance, the woodcuts are interspersed with the text in the same way, and the etchings are printed apparently from the same plates, and have their titles on their thin fly-leaves in the same French fashion. This similarity leads one to expect a likeness in more important points, and, in fact, this book seems to be as nearly a reproduction of M. Jacquemart's book as Mrs. Palliser and the publishers could make it. The differences are the inevitable ones; thus the etchings, which are printed separately and of full-page size, are not as good impressions as those to be found in an early copy of the French edition, and the woodcuts are not quite so delicate, though perfectly satisfactory and clear. Mrs. Palliser's translation, too, though close and accurate, is not all that could be wished for in ease and grace. Nor is the meaning always perfectly rendered; though, what is strange, the principal faults are not those of misunderstanding of technical terms, of which, indeed, Mrs. Palliser seems to have an accurate knowledge, but rather slips in the rendering of common French expressions into the corresponding English. Thus, on page 195, the Greeks are credited with the invention of "a rudimentary plastic," the excuse for which is to be found in *une plastique rudimentaire* of the original, which is tolerable French, while the translation is not English. On page 234, the earthen pots found in the Seine, and supposed to have accumulated there as the accidental waifs from some mediæval cabaret, are called "recipients," as of liquor, because the French word happened to be "*récipients*"; "receptacles" would have been better, and "cups" or "flagons," or, more undeterminately, "vessels," would have been better still. So *vulgariser* is not to vulgarize, but to make popular; when Alexandre Dumas told the late Emperor that he was a *vulgarisateur*, he meant to claim a good deal of credit for himself and his historical novels. "Ils ne sont pas du même usage" does not mean "they are not of the same usefulness," but, rather, "they are not used for the same purpose." And so on; but we do not consider this a very grave evil, at least in any one book, however serious it may be that translations should nearly always be full of just such utterly needless errors. Moreover, it is not so great an evil in this book as it would be in a purely literary production; and yet we find this translation an unusually correct one. Thoroughly good translations, such as, let us say, the best of Carlyle's, are nearly as rare as books like 'Sartor Resartus.' Of course, great labor would be required to make every sentence of the translation of a big octavo as perfect in rendering the author's thought into idiomatic English as, for instance, that of the catch-words and war-cries, the epigrammatic sayings

* 'History of the Ceramic Art. By Albert Jacquemart. Translated by Mrs. Bury Palliser.' London: Sampson Low; New York: Scribner, Welford & Armstrong. 1873.

and bits of temporary slang, scattered through 'The French Revolution.' The volume before us would have had to wait while the touchstone and the file should go over it; and, after many days' work, it would not have been very much better for its purpose.

The works on pottery and porcelain of which so many have appeared during the last few years, unless they are merely dictionaries of marks and dates and makers, are all of the nature of historical essays. Those of them which are monographs are apt to be the most accurate and the most full. Of the remainder—those ambitious books which try to include the whole history of the ceramic art, or a large part of it—we are inclined to give the first place to M. Jacquemart's present work. One great advantage is, that it is the most recent; and that means a great deal when so many investigators are at work, and when important discoveries are made every year, not merely of new and valuable specimens, but of documentary and other evidence. So short a time ago as 1862, when M. Jacquemart published his splendid book on porcelain, he could not have told us anything about the extraordinary *faience* of Oiron, for instance, the "Henri Deux" ware of the old catalogues—even if it had come within his province. Mr. Benjamin Fillon has cleared up that once mysterious matter, the doubtful origin and manufacture of that fine pottery of which less than seventy pieces are known, for one piece of which the South Kensington Museum gave eleven hundred pounds ten years ago, of which a fine piece might fetch two thousand pounds under the hammer to-day. In the wide and interesting field of majolica (for so we propose to call it, following M. Jacquemart and Mrs. Palliser, and ignoring the purist Englishman, who nowadays spells it *maiolica*)—in this particolored and variegated meadow, diapered with the wildest fancies of flower and leaf, and inhabited by the strangest beasts and men and demigods that filled the fancies of the lesser artists of the Renaissance, all our knowledge is new; what has been learned about majolica within fifteen years has not been so much an addition to the old stock of knowledge as an overturning and supplanting of absurd old errors. And accordingly, we are sure to find the chapters on Henri Deux ware and majolica, as also those on the *faience* of Rouen, the stone wares of Flanders and Germany, and the like, inspired by the newest discoveries and the most matured judgment of connoisseurs.

It is to be remarked that the essay form is carefully preserved. The body of the book is not cut up with tables and classified lists, nor are such aids to memory added in an appendix. The hand-book style, the dictionary look, are avoided as much as possible, and the text is a disquisition upon certain points that seem to the author the most worthy of consideration, with no more reference to special objects or collections than enough to explain his meaning. This characteristic of the book is not in its favor as a book for the student or collector to refer to when in haste for a morsel of knowledge: it is probably advantageous to it in a proportionate degree, considered as a pleasant and stimulating book for beginners and for general reading. In one part, however, the book is more minute and less generally interesting—that is, in the chapters devoted to the various *fabriques* of France. Many of the smaller establishments in the provinces had almost been lost to memory until late investigation had recalled them, and their wares had been confounded with those of more prominent and still existing factories. It is probable that no work gives an account of these at once so full and so correct as the present one.

Of the illustrations, the twelve etchings by M. Jules Jacquemart would be called excellent if by any other artist, and are only surpassed by the same draughtsman's work in larger and more costly publications than this. M. Jacquemart's style seems to be changing, however, and is less hard and formal, less strikingly portrait-like, in these etchings than in those of ten years ago in 'L'Histoire de la Porcelaine,' or in the more recent illustrations of arms and armor and precious objects in the great collections of Paris; or even in the reproductions of the pictures of our New York Metropolitan Museum of Art made not three years ago. The woodcuts are beautiful, and, though a number are old friends, the majority are of wholly unfamiliar pieces.

MAGAZINES FOR JANUARY.

SCRIBNER'S for January is as well provided with readable matter and as profuse of illustrations as usual. The reader will understand what he has to expect when we say that among the contributors are writers so well known as R. H. Stoddard, T. W. Higginson, Jules Verne, J. A. Froude, George MacDonald, Mrs. Harding Davis, John Hay, F. Bret Harte, C. D. Warner, J. G. Saxe, Gail Hamilton, and "H. H." Of a large number of these ladies and gentlemen it may be said that for many years now they have been regular magazine-makers, and that their work is of a merit tried and approved in the eyes of the magazine-reading public. We ought to add the name of D. Holland, who also is well known, and who, as editor of the magazine, furnishes each month a certain quantity of discourse upon such current matters as seem to him to require comment, and who is as satisfactory as ever. The topics treated of in his department this month are the Evangelical Alliance and the prospective disappearance of many of the sects; the abominable badness of the cheap American restaurant; the pernicious character of much of our literature for boys. On each of these subjects the common consent of mankind is expressed by Dr. Holland with a vigor that leaves nothing to be desired in the way of vigorousness. As regards the tone of some of our juvenile literature, our editor's audience, perhaps, needs no counsel. It ought not. But, on the other hand, perhaps it does; for the short-sightedness, or rather blindness, of perfectly respectable and rather intelligent parents in this particular is all but incredible. Dr. Holland speaks of "the quality and animus of a magazine which is published by E. J. Brett of London, and is distributed by an advertised general agency" throughout the country, and which deserves denunciation as "a moral nuisance." But we need not look so far from home. Any one of our news-stands will at any time show us an American magazine for school children in which the principal illustration will very likely represent a gallant boy of fourteen tripping up a policeman, or sending the assistant master headlong down a flight of steps. Or in a juvenile magazine which is of such pretensions as to have a department in French, we may this month see a clever picture illustrating a capitally written little story, both of which, picture and story, inculcate the lesson that a good thing for you to do in the snow-balling season, if you are a boy, is to go softly behind an elderly couple and suddenly give the old gentleman a snow-ball, as hard as you can hit him, just behind his ear. You are then to express your regret at this accident, and say that if that is the way people are getting hit in the public streets you, for your part, are going home. We find this little sketch in the *Saint Nicholas*. There is nothing very dreadful in it all; but if such teaching is admitted into the best juvenile magazine in the country—and a very good magazine it is—what is to be looked for in the poorer ones? And even though there is nothing very dreadful in it all, we may properly insist that while every boy should be permitted his fair allowance of mischief, and may be at least connived at in a due amount of strategic concealment of all the facts in a given case, it is nevertheless true that there is no need of supplying him with clever artists and bright story-tellers to instruct him in these arts. It is true that the *Saint Nicholas* sins but seldom, either in this way or in the far worse way of mawkishness and goodiness which has infested juvenile literature since the days of Little Nell at least, and which the women who have since then become so numerous in the fields of fiction have not helped to diminish.

Of the writers just enumerated as contributing to make the January *Scribner's*, there is none who has done anything with which his admirers will find themselves unfamiliar, or with which the general public will be pleased in any especial manner. A writer whom we have not named, Mr. Edward King, continues what is doubtless as attractive an article as any of those by authors of more reputation than himself. Some months ago he was sent into the Southwest, and he has since been giving the readers of *Scribner's* some pleasant sketches of the social, political, agricultural, and other aspects of life in those regions. He is to be called a fluent rather than a statistical or weighty reporter; but he seems to give a clear notion of the general condition of affairs, and often is graphic and amusing. The letter-press is copiously adorned with pictures, and, altogether, Mr. King's papers, considering their subject, the way in which it is handled, and its illustrations, are a good specimen of a kind of serial more popular with Americans—men, women, and boys—than most new novels.

Mr. Higginson makes a critical notice of the works and literary character of Mr. Charles Dudley Warner, whom he assigns to the "Meditative School," as he proposes to call it. There is hardly need of a specific name, we should say. And to say so may be well enough, for our men of letters still have a trick of magnifying their office. We make as much noise over some titmouse's one egg as if eggs were a new thing in the world, and the one just laid were the roc's egg itself. It is pleasant to imagine the anguish of some of our American men of letters could they be put into the spiritual charge of the late Jonathan Swift, for example, and compelled, under pain of some conversation from that gentleman, to fling off anonymous pamphlets. With regard to Mr. Higginson's suggestions about Mr. Warner, who, as it happens, has been much more read than criticised, they appear to us to be very sound. Mr. Warner is one of a class of writers of whom the United States have been turning out a great many of late—writers whose method is humorous and taking, but of whom one by-and-by asks whether or not they have much in their heads, and how long they will be able to keep up writing. "The thinness of material," of which Mr. Higginson hints a suspicion, soon becomes felt and perceived, rather than "suspected," and we see the "humorist" disappear in the jester or droll. It

seems to us that on another page of this same magazine, in Mr. Warner's serious essay on Mr. Froude and his notions of progress, the thinness of the material is very obvious.

A criticism of Mr. Quincy Ward's Shakespeare; a happy ending of the "Princess of Thule"; more of the "New Hyperion"; a biographical sketch of the late Chester Harding; an account of the superstitious lore in which the Japanese fox figures; an affecting and simple story by the author of 'Blindpits'; some chat about French marriages; a description of the gambling-hells of Monaco; a wondrous recipe for the cooking of a goose; and some other matter, constitute the January *Lippincott*, in which there is little to skip. We might appropriately refer at some length to this same goose, for the January magazines of this year make a singularly small show of sausages and turkeys and carols and elves and angels and Scrooges and Marleys and unrelenting guardians, and the other properties. For whatever reason, a reaction appears to have set in, and very heartily, we imagine, it will be welcomed, for the wholesome mirth and good feeling of the season had been to no inconsiderable extent overlaid by such rubbish. As for *Lippincott's* goose, one would say that, so far as concerns savoriness at least, Mr. Bob Cratchit himself might be satisfied with it. The business of preparing him for dinner is thus to be entered upon and conducted: A young, healthy goose, and one in his first feathers, is to be selected. For one week he is to be fed on corn-meal dough, and is to be allowed the run of a yard, with plenty of sweet grass and an abundant supply of fair pure water. Then for two weeks he is to be fed upon boiled rice, with which you may, if you choose, mix chopped celery, and at the end of this period he is ready for the knife. But by no means for the spit or the Dutch oven. He is to be drawn while his feathers are still on him, and within him is to be put a large Labrador herring, after which he must be wrapped up in several folds of linen cloth, and you must then bury him for four days under three feet of clean clay. There is more of the recipe, and it is much of the same kind as that already given. It concludes by advising that the owner of the bird, in inviting persons to the feast, should invite according to a rule allowing to each man four pounds.

"Japanese Fox Myths" tells some rather amusing stories about the fox of fable, who in Japan as elsewhere is an astute animal, unscrupulous in the pursuit of his own ends, and given over to an evil mind. The Japanese appear to confer on him many of the attributes of our demons and hobgoblins. For instance, they believe that he enters into people, as the devil into the Gadarene swine, and possesses them. It is said—and to hear it said gives rise to certain reflections in the minds of American citizens—that "the maudlin and indecent conduct of certain foreign gentlemen, the shining exponents of 'modern Aryan civilization,'" is explained by the Japanese not as being caused by "alcohol and total depravity, or that partial depravity commonly called 'cussedness,'" but as being the result of vulpine possession.

The *Catholic World* seems to begin the year in the right spirit. Casting a look backward over 1873 before turning its face towards 1874, it concedes the death of King Herod and the Emperor Tiberius, but is unable to base any hope upon this state of facts: "There is no pagan Rome," it says, "but there is a Christian Germany. The dead ashes of the divine Emperor Tiberius were long ago blown about the world, but the divine Emperor William still lives. There is no Herod, but there is an Emanuel whose name is as characteristic of the man as the word Eumenides of what it was intended to represent. . . . The world seems at the crisis of a fever." For the rest, the *Catholic World* has its usual array of articles, original and selected, and nothing to call for particular comment.

Mr. David A. Wells contributes to the January *Atlantic* an interesting and well-written article on "Local Taxation." In the *Nation* for February 6, 1873 (No. 397) is an article, also by Mr. Wells, on the same subject, in which was pointed out the curious fact that the whole theory and practice of local taxation in the United States were being gradually undermined by the courts of last resort, as the English theory and practice were long ago by theirs. In his present article, Mr. Wells contributes additional evidence of the change which he says is going on. Without going into unnecessary details, we may say that the present theory of taxation is simply to tax everything, houses, horses, books, lands or mortgages, bonds, bills, notes—all property, tangible or intangible, real or unreal, equally, and to tax it in the case of personal property at the owner's place of residence. The courts are gradually, by judicial decision, breaking up this system, laying down rules in particular cases which are directly antagonistic to it. Mr. Wells refers to a number of cases, particularly one lately decided by the Supreme Court of the United States (15 Wall, 306, 328) and a recent decision of the Supreme Court of California, which holds the double taxation of mortgages illegal. The tendency of the courts is to declare the *situs* of personal property for taxation to be the place in which it is found, to break up all double taxation to make it more and more difficult to tax such property as is really mere evidence of debt, and make all taxation fall upon what is tangible, visible, and real.

Of the late Mr. Agassiz's 'Evolution and Permanence of Type,' the key-note is given in these words: "It cannot be too soon understood that science is one, and that, whether we investigate language, philosophy, theology, history, or physics, we are dealing with the same problem, culminating in the knowledge of ourselves. . . . Our own nature demands from us this double allegiance." These two weighty articles the *Atlantic* balances, so to speak, with some matter that is decidedly light; as "Lida Ann," "The Two Pillars," "Baddeck and that Sort of Thing." Light enough, but also bright and entertaining, is the beginning of the story of "Prudence Palfrey," by Mr. T. B. Aldrich, "whose story of 'Marjorie Daw,'" says the prospectus of the *Atlantic's* new publishers, "took the edge off the panic." What with these articles, and the free-and-easy manner of "Mose Evans" and of Colonel Waring's "Fox-Hunting in England," the magazine has this month something of an unusual flavor, which will be agreeable to some palates. And a continuance of it may be confidently depended upon as long as Mr. Baker's "Mose Evans" is running. His 'New Timothy' and 'Inside' are proofs and guarantees of his singular aptitude for getting the local coloring of his scenes and catching the outside marks of his figures, and such parts of their characters as find expression in the broader marks. Mr. Whittier, Dr. Holmes, Mr. Bayard Taylor, and Mrs. Celia Thaxter unite to keep the poetry of the *Atlantic* up to its traditional level.

The *Galaxy* contains for its longest article a curiously ill-judged and unskilful piece of polemical writing by Mr. J. S. Black. He travels miles out of the record, in which he has a fairly good case, of which he makes a great deal, and leaves off his attack upon Mr. Adams's Mr. Seward in order to urge once more with customary violence and heat the old arguments of Mr. Buchanan's Attorney-General. That the cause in which so many arguments were expended in vain was a cause which only the last argument could settle; that the question was, which of two sets of men and two sets of ideas should absolutely abase and rule the other; and that in the struggle constitutions and institutions had to undergo some strain about which it is sheer childishness to groan, Mr. Black does not seem to understand. He probably will die without knowing that he is in the position of a man who has fallen among his enemies, and been as thoroughly stripped, beaten, and led into captivity as the laws, not of peace, but of war, allow. This is the main and vital defect of his general position. On the narrower issue he makes a bitter and furious, but a skilful and successful fight.

The infectious nature of the *odium philologicum* appears to be exemplified in the case of the editor of the *Galaxy*, who cannot so much as write a brief marginal note to a philological article by Mr. R. G. White without himself reaching "the large utterance" of the verbal critics: "The mild and Peck-sniffian tone of a letter recently published by Dr. Hall, with its demure talk about the language of gentlemen," etc., etc.

Taking its weak spots and its strong spots together, the first number of the *International Review* must be called a good first number. The new quarterly is, by the way, to be a bi-monthly, for its publishers, Messrs. A. S. Barnes & Co., announce that they have received so much encouragement in their new enterprise that they have determined on issuing six numbers a year instead of four. We should say that the strongest parts of the *International* are ex-President Woolsey's ("International Arbitration") and Baron Franz Von Holtzendorff's ("The Prussian Church Law"). Both of these are truly of interest to a public on each side of the water, and Professor Von Holtzendorff's has the further merit—from one of the *International's* points of view—of being adapted to enlist in its behalf the attention of an American public, religious and otherwise, which takes a very vivid interest in half-a-dozen questions discussed by the Professor. Among these are the attitude of the Roman Court towards the Protestant Churches, of the Ultramontanes towards Protestant Governments, and especially the North German Imperial Government; the history during the last quarter of a century of the three "privileged" churches of Prussia; the relations, past and present, of Prussian Liberalism to Catholicism; the intent of the North German and Prussian Governments in their recent action as against the Jesuits; the probable future of Protestant and Liberal Europe as against the Infallibilists and the reactionary party. Professor Von Holtzendorff touches incidentally on one or two things his handling of which may not very well please some of his American readers. Of these things one is the debate in this country about the reading of the Bible in the public schools. The other thing is the general relation of the state to religious bodies. We do wrong to say that it is only incidentally that this latter problem is dealt with. In reality, it forms a good part of our essayist's theme. What we had in mind was some few detached remarks which reminded us of the large class of public men and public instructors in this country who forget the enormous, the almost overwhelming, difficulties of government and statecraft in old

densely populated countries, and who dismiss all hard questions by enouncing eloquent and contingently true eulogies on Liberty, and pointing to our boundless West. However, the deluge is to be after our time; only the habit of flouting Noah leads to various contemporary evils. Professor Von Holtzendorff's essay will for several reasons repay study; and it may be said to require a little study. Ex-President Woolsey in his article is mainly historical, and shows the antiquity of the process of international arbitration. This, however, he may be said to show without detracting from the dignity of the latest great illustration of the principle. Indeed, this dignity he enhances by his learned list of small cases; and by his remark, "It must be confessed, however, that the compromissory way of reaching a just decision has not been applied, common as it has been in modern times, to many very important international questions." Several aspects of the general question as to the feasibility of settling international disputes without war—some of a dreamlike character, and none seeming very real and waking—come up for Mr. Woolsey's treatment, and they all get the benefit of his penetrating good sense. Professor W. B. Carpenter's essay on deep-sea explorations and what it has taught the geologist and geographer will, we hope, not be found too difficult in its details by the general reader. A small acquaintance with modern researches into the physical condition of the ocean depths, and the nature of the life there found, will suffice to make this a very interesting paper. The doctrine of Vertical Oceanic Circulation—a favorite doctrine of Professor Carpenter's, and in a certain sense his own—with its bearing on the theories as to the climatic condition of Northwestern Europe, receives a good deal of Professor Carpenter's attention. So, too, of the azoic condition of the deep basins of the Mediterranean, and of the under-currents into the same sea from the Euxine, and out of it through the Straits of Gibraltar. We have hardly left to ourselves space enough to do more than give the names of the articles entitled respectively "Universal Education," "Fires in American Cities," "Our Late Panic," and that one entitled "Books," which closes the *Review*. The two last-mentioned are articles not to be commended for their thought or their tone; that entitled "Universal Education" is mostly vague and general, and when it is not vague and general is, nevertheless, not up to the standard of a good review. It is not telling people much nowadays to tell them that normal schools are useful; that compulsory education may sometimes be good; and that it would be well if parents could be made to take an interest in the welfare of their children. The paper on fires in our American cities contains a great many sound remarks on various topics—for example, as to the way in which insurance companies overdo business; in which architects and owners build scandalously unsafe structures; and in which fire-departments fail in organization and duty. It is worth reading. The last sentences of the article some may think curious:

"It is worthy of emphatic notice that the New Jerusalem of the Apocalypse has no inflammable materials—its walls of jasper, its foundations precious stones, its streets of gold, its gates of pearl. Emblems these are, no doubt, of the strength and beauty with which we are to build characters that shall come forth unscathed and immortal from the fires of earthly temptation and trial; but may we not equally take them as types of the material structures, which, in their fragility or their enduring massiveness, we are prone to build after our own likeness?"

BRACHET'S FRENCH DICTIONARY.*

M. AUGUSTE BRACHET belongs to the new school of French philologists which is doing much to clear France of the reproach that foreigners, principally Germans, have done more than natives to further a truly scientific study of the French language. The names of Diez, Mätzner, Bartsch, and others will always be mentioned in connection with French philology; but the learned editors of the *Revue Critique* and of *Romania* have the great merit of first setting the example in France of a solid and broad criticism in linguistic matters. Their horizon is not limited. They have profited by the labors of the learned of other nations, and they present the results of their acquaintance with German learning especially, enriched by original research, in a form that is as agreeable and clear as the other is sometimes dry and intricate. Among many of the new school, MM. Gaston Paris, Paul Meyer, and Brachet have devoted themselves to researches in the domain of French philology. M. Brachet, besides his 'Grammaire Historique' and his 'Dictionnaire Etymologique,' both elementary, has written several works of special erudition. It is in consequence of his own contributions to philology, as much as to those of others, that his 'Historical Grammar' (published in 1867) now needs a complete revision to bring it up fully to the present state of knowledge.

The 'Dictionnaire Etymologique' has found an able translator in Mr. Kitchen. As the editions now stand, the English work is far preferable to the French. It is considerably increased, probably by the author himself. The introduction (126 pages) has in part been rewritten, and the whole is presented in a better, clearer form than in any of the previous French editions. The 'Etymological Dictionary' is not addressed to the learned but to the learning world. The author carefully avoids all discussion of mooted points. He gives, in a clear, elementary manner, the results of the etymological researches of Diez, Littré, Scheler, and others, showing their justness, and tracing back carefully the present forms of French words to their Latin originals. In this consists the merit, the originality of the work. There are other dictionaries in which French etymologies may be found: Scheler's work, for instance, may in many cases be fuller and more satisfactory; but he, as well as Littré and Diez, presupposes a certain amount of knowledge of the subject. The present work, on the contrary, is a guide for the learner; its aim is to explain every fact stated, and to account, as far as possible, for every change that has occurred in the passage of Latin words into French. Whenever an etymology is not certain, no conjectures are admitted; the word is dismissed with the phrase "origin unknown." This last feature, though in perfect accordance with the general plan of the author, is liable to some objection. It is, to say the least, unsatisfactory to look in an etymological dictionary for information in regard to such common words as *petit, mauvais, soin, besoin, besogne,* and others (above 600), and find nothing but such a statement. Even the merest beginner will not rest satisfied with such information; nor is it right that he should. A plausible conjecture, given as a mere conjecture, with perhaps a word or two to call attention to the impossibility or absurdity of some of the old derivations proposed by Ménage and others, would tend much to correct some of the prevalent mistakes that are now current in regard to the origin of just such words.

The long introduction is good. Book III., "Phonetics," containing the history of the Latin letters in their passage into French, is excellent, better than anything on the same subject that has heretofore been published. It is much increased in the English version, and it is to be hoped that the author will embody these new researches in some future edition of his 'Historical Grammar,' where they naturally belong. They are, of course, based on that mine of information in regard to the Romance Languages, Diez's 'Grammatik der romanischen Sprachen.' Much is also taken from the preface of a recent work by M. G. Paris, 'La Vie de Saint Alexis,' to which the indebtedness is not sufficiently acknowledged. But the great merit of M. Brachet is the clearness of his statements, and the beautiful arrangement of the material. The whole treatment of this difficult subject shows the author to be capable of original development, carried further than anything he has yet attempted.

A list of *errata* would not have been superfluous in the English version. There are several such mistakes as *gnt* (p. xv.) for *gril*. On p. xxv. we find *boulingrin* (bowling green) placed among sea terms derived from the English; probably merely a misprint for *bouline* (bow line).

The translation is excellent, but there is evidently a slip on p. xx., where we are told that "many *strange* words have forced themselves" into the Breton dialect; *étranger* means foreign, and the author wishes to dwell particularly upon the fact that French words introduced into the Breton were *foreign* as far as that dialect were concerned. Again, though Galvani *was* an "Italian physician," as the translator has it, the French work speaks of him as "*un physicien italien*," not a *physician*, but a *physicist*.

There are not a few inaccuracies for which the translator is not responsible. To mention only a few: on p. xx, *bidet, dartre, garotter, matras,* are given, probably correctly, as of Celtic origin; in the Dictionary they are said to be of unknown origin. *Cormoran*, in p. xx., is given as Celtic; in the Dictionary the word is referred to the Latin *corvus marinus*, and not a word is said of the Celtic origin, which is well explained by Scheler. There are several other inaccuracies of the same kind. Thus, on the first half of p. xxiii., the following occur: *Héraut, marcher, rapière, brasse, blesser, bronzher, carpe, clapir, faucon*, are all said to be of Germanic origin, but in the Dictionary the origin is given as "unknown," or the words are simply referred to a Latin primitive. *Guérite, guide, hallebarde*, and several others, are given as Germanic; in the Dictionary they are simply referred to the Italian or Spanish. Both statements may be true enough, but in an elementary work they are confusing. *Gaffe*, given as Germanic, is called Celtic in the Dictionary. Many words are also given as Germanic derivations which do not figure at all in the Lexicon. In general, the whole treatment of the Germanic derivations is unsatisfactory.

There are also some puzzling references to the 'Historical Grammar,' and several altogether wrong. Thus *ainsi* is given as being in Old French *ensi*, further back *insi*, from Latin *in-sic*; then follows a reference to 'Historical Grammar,' p. 158. On looking there we find *ainsi*, O. F. *asi*, Lat. *hoc-sic*.

* 'An Etymological Dictionary of the French Language. By A. Brachet, author of 'An Historical Grammar of the French Tongue.' Translated by G. W. Kitchen, M.A.' New York: Macmillan & Co. 1873.

On another page of the 'Grammar' (p. 168), not referred to in the Dictionary, we find "*ainsi*, origin unknown [perhaps from *ante-sic.*]"

Such signs of haste or careless revision are too common in a work otherwise excellent. They could all be made to disappear in a second edition. Such as it is, Brachet's 'Etymological Dictionary' is by far the best elementary guide that exists in any language to the study of special philology. It is not very pleasant to think that while the French language has such excellent works on its etymology as those of Littré, Scheler, and Brachet, the student of English is reduced to such an imperfect, one-sided attempt as Wedgwood's, or to the meagre etymologies given by Mahn (good as far as they go) in the work known as 'Webster's Dictionary.'

Nast's Illustrated Almanac. (New York: Harper & Brothers. 1873.)—Mr. Thomas Nast's comic almanac offers not only amusement, which it furnishes by means of his pencil and some letterpress from "Mark Twain," "Josh Billings," and other humorists, but also gives the usual more or less inscrutable information, zodiacal, tidal, and in reference to the Sundays after Trinity, which is furnished by other almanacs. Mr. Nast's illustrations begin at the outside of the first cover, and end with the outside of the second, and fill the book. Our readers know very well the kind of illustrations that they ought to expect if they purchase this work, and they will not be disappointed —agreeably or disagreeably; unless, indeed, they have been imagining that Mr. Nast is always to show himself as clever as they thought he was last year, when he had the Greeley campaign to aid him, or two years ago, when the attack on the Tweed Ring was made. But the almanac shows the same skill in giving a certain number of forcible caricatures of typical faces. Nobody will recognize in the artist's Irish servant-girl anything but a welcomely libellous caricature, done *con amore*, of that functionary, nor fail to see in the New York barkeeper and the gin-drinking customer the true things themselves, less mercilessly caricatured—drawn, perhaps, with a certain kindliness, as if they were not a bad sort of fellows after all. These and other faces we find truthful and amusing. But we confess that, to quote Froissart one time more, we "take our amusement sadly" in a great number of cases. It becomes somewhat serious when we are asked to amuse ourselves with a picture like that on page 38. It is one of a series setting forth some of the infelicities attendant upon domestic life, as that bills come in, and so on. One of these incidental evils is that your little son, not yet out of petticoats, wanders to the croquet ground, where he is hit on the head by a ball. The result as here depicted is that there appears on the head a vile-looking protuberance, which, as regards shape, height, and comparative size, may be represented by a common glass tumbler. And a most vulgar, unwholesome, and repulsive child your little son is in other respects also. This defect of coarseness runs through all the book—to make our statement no larger. A healthy mind—and for purposes of this discussion we assume ours to be such—will not allow itself to be bothered too much, we suppose, by a little vulgarization of its comic almanac. But enough is a feast. And Mr. Nast is not alone a comic-almanac maker, but a person endowed with a useful and valuable gift, which he employs effectively in other fields, and to the employment of which attaches a responsibility. We may add, also, that the very rigid limitations and very great deductions to which this gift of his, as commonly conceived of, is liable, may profitably become the subject of public recognition.

Recent Music and Musicians. (New York: Henry Holt & Co.)—The last decade of the eighteenth century, and the first half of the nineteenth, witnessed the production of a large part of what we now recognize as masterpieces of musical creation. At the head of this activity was Beethoven, who as early as 1810 had attained apparently the highest possible rank in music. The Mozart school of the previous generation was represented by J. B. Cramer, Clementi, and Hummell. The "new romantic school," based on the more fanciful side of the Beethoven foundation, was just coming into vogue in the works of Chopin, Mendelssohn, Schubert, and Schumann. Ignaz Moscheles was born in 1794, and in 1814 commenced his public career as a pianoforte virtuoso and composer, in which he enjoyed the highest success until 1846, when he accepted the chair of pianoforte instruction in the Leipsic Conservatoire (then just founded), where he led a life of quiet usefulness and honor until, full of years, he died in 1870. Moscheles appears to have been a man of a genial and open disposition, with good business tact, a genuine fondness for public appearance, and with that kind of talent which (as distinguished from genius) finds a full and ready sympathy with its own generation. In 'Recent Music and Musicians' we have the history of his life and works, and his delightful relations with the great musicians mentioned above, as well as a multitude of others of every school and nationality, edited by his wife from his diary and correspondence, and adapted from the German by A. D. Coleridge. A more readable book we have rarely seen.

Geological Stories. By J. E. Taylor, F.L.S., F.G.S. (New York: G. P. Putnam's Sons.)—This little book is made up of a series of articles originally contributed to *Science Gossip*, now for the first time brought together in a more permanent form. The design of the author is to give a succinct geological history of the development of our globe, from its earliest condition down to the first evidences of the appearance of man upon the earth, presenting the essential facts and deductions, side by side, in so popular and entertaining a manner as to interest the unprofessional reader. As an aid in making his subject more attractive, he adopts an autobiographical style. A "piece of granite," a "piece of quartz," slate, limestone, sandstone, rock-salt, and other mineral substances, are made to act as spokesmen, each in chronological order, relating the story of one of the great divisions or periods of geology. The book scarcely treats, as the titles to the chapters would suggest, of physical geology, but rather of palæontology and the progress of life. Thus, a "story of a piece of Whitby jet," of which a pleasing and instructive chapter might be written, has very little to tell us about jet, an article of commerce at the present time largely employed in adding to the charms of young widows, but has a great deal to say about the fossil flora and fauna of the Lias beds of England, in which the mineral happens to occur. A similar remark would apply to nearly every story told. Two serious faults, we think, render the book ill-adapted for beginners in the study of geology. It is an error attempting to compress all the elements of a science into so limited a space. The real object of the author might be gained far more easily by elucidating a few fundamental points more fully, than by seeking to touch upon every subject found in the more advanced manuals and text-books. There is also great lack of judgment shown in the relative importance attached to the subjects treated—minute details being frequently expanded at the expense of more weighty matters. In style, the author is clear, and generally accurate in statement, while the pages are profuse in illustrations, not always well executed.

Irish Emigration to the United States: What it has been and what it is. By the Rev. Stephen Byrne, O.S.D. (New York: Catholic Publication Society.)—This is emphatically a work written in good faith, and with an eye single to the welfare of the people to whom it is addressed. It "does not profess to be one of a peculiarly religious character," and it is noticeably free from prejudice both in speaking of Protestants and in its account of the Government under which we live. "Often," says Father Byrne, "non-Catholics show the greatest liberality in helping to build and decorate our churches." "The writer is acquainted with many cases in which non-Catholic employers—masters and mistresses—will have no servants excepting *Catholics* who comply with the duties of their religion." "Since the time of the Revolution, there has been no *ascendency* party here either in church or in state; but a perfect equality prevails, and even a possibility, where there is a fitness, to enjoy any office of honor or trust. Foreign-born citizens are eligible to any office in the land, excepting only the office of President of the United States." "I know for certain that, outside of large cities, 'strikes' cannot take place with much effect; and that, when we consider this as a free country, labor of all kinds will, in the long run, be free." The Homestead Law "reflects infinite credit upon the legislators of America. It more than realizes the highest dreams of the most *ultra* communists of this or any other age."

These extracts will serve to show the spirit and intelligence of the author. His main object is to induce the Irish who are already here, and those who are yet to come, to leave the squalor and temptations of the large cities, and betake themselves to the country, as laborers or as farm-proprietors. In this he will have the hearty support of all Americans, and the circulation of his handbook should be promoted by the authorities of every State which desires to increase its working population, or to thin out its pauper classes. Father Byrne has collected testimony from the best sources in regard to the condition, as regards soil, climate, wages, etc., etc., of all the States, and presents it in a compact, easily intelligible form, often with the text of the letter from the Bishop or other responsible authority. His information is not so full as that given in the 'Handbook for Immigrants' of the American Social Association, which perhaps errs on the side of fulness. Like that, however, it is fit to place in the hands of other than Irish immigrants, particularly the German, statistics of the German population everywhere accompanying those of the Irish. An appendix contains tables of the total population of the United States; of the prices of farm and mechanical labor in the several groups of States; and of the population of State capitals and towns and cities having upwards of 8,000 inhabitants; and, finally, a map of the United States satisfies the last requirement of a work of this character.

HENRY HOLT & CO.

HAVE JUST PUBLISHED

TYLOR'S (E. B.) PRIMITIVE CULTURE. Primitive Culture: Researches into the Development of Mythology, Philosophy, Religion, Art, and Custom. *First* American from the Second London edition. 2 vols. 8vo, $5.

"Those who have not read the earlier volume, and who know the author only by hearsay or not at all, have yet before them an intellectual feast the like of which they will have seldom enjoyed; for the present is one of the few erudite treatises which are at once truly great and thoroughly entertaining. . . . We do not know how we can more aptly express our sense of the thoroughness of Mr. Tylor's scientific culture than by saying that he constantly reminds us of the illustrious author of the 'Origin of Species.' . . . In tracking the wilderness of primeval speculation, he is a guide no less safe than delightful."—*North American Review.*

FREEMAN'S (EDWARD A.) HISTORICAL COURSE. Vol. III. Scotland. By Miss MacArthur.

It is hoped in time to take in short histories of all the chief countries of Europe and America. Those of England and Scotland are ready, and authors are at work on other parts of the plan. All the works will be edited by Mr. Freeman, and adapted for the use of American students.

TAINE'S TOUR THROUGH THE Pyrenees. Illustrated by Doré. Square 8vo, cloth, gilt, $10; full levant morocco, $20.

BUZZ A BUZZ; or, The Bees. By W. Busch (author of 'Max and Maurice'). Translated by Hezekiah Watkins. With humorous colored illustrations. 8vo, cloth, $1 50.

STRAUSS'S THE OLD FAITH AND the New. $2.

MOSCHELES' RECENT MUSIC and Musicians. $2.

MILL'S AUTOBIOGRAPHY AND Miscellaneous Works. Uniform Library Edition, 10 vols. 8vo, cloth, $2 25 per volume (except volume on Comte). The Autobiography, 1 vol.; Dissertations and Discussions, 4 vols.; Representative Government, 1 vol.; Sir William Hamilton's Philosophy, 2 vols.; On Liberty, Subjection of Women, both in 1 vol.; Comte's Positive Philosophy, 1 vol., $1 50. The 10 vols. (cloth) in a box, $21 75.

CHOICE! CHARMING!! CHEAP!!!

THE NURSERY. A Monthly Magazine for Youngest Readers.

This unique and much-admired work, begun in 1867, and now a welcome and trusted visitor in every intelligent family where there is a child, retains its Unrivalled Corps of Contributors and Artists, and gives in every number a profusion of

THE CHOICEST PICTURES,

executed in the best and most costly style, and designed especially for the young. The peculiar features that have distinguished it thus far will characterize it during the coming year; and

NEW AND VARIED ATTRACTIONS

will be continually added. Subscriptions may begin with any number; and back numbers, either separately or in beautiful bound volumes, can be always supplied.

Terms—$1 50 a year in advance. 15 cents a single number. Published by

JOHN L. SHOREY,

36 Bromfield Street, Boston, Mass.

GIFT-BOOKS FOR CHILDREN. The bound volumes of "THE NURSERY" are published—Half-yearly, green cloth, gilt, $1; Yearly, $1 75.

The publication of the Magazine began in 1867, and all the volumes from that date can be supplied.

"The bound volumes of *The Nursery*, in their attractive covers of green and gold, contain just the tid-bits for childish appetites. It is almost impossible for any other gift for very young folks to be such a *multum in parvo* as this 'Nursery' of delights."—*Boston Transcript.*

HARPER'S CATALOGUE. The attention of those designing to form libraries or to increase their Literary Collections, is respectfully invited to Harper's Catalogue, which comprises a large proportion of the standard and most esteemed works in English Literature—*comprehending over three thousand volumes.*

Librarians, who may not have access to a trustworthy guide in forming the true estimate of literary productions, will find this Catalogue especially valuable for reference.

The Catalogue is arranged alphabetically by the authors' names, anonymous works by their titles. The index is arranged by the titles of the books, besides having numerous appropriate heads, each general head being followed by the titles of all works on that subject.

Harper's Catalogue sent by mail on receipt of six cents.

Address HARPER & BROTHERS,
Franklin Square, New York.

A Priceless Acquisition for Clergymen, Students, etc.

THE BLANK-PAGE BIBLE.

With Maps, References, Tables, and Index.

1 vol. 8vo, one-half morocco, price $9.
1 vol. 8vo, one-half morocco, extra, $10 50.
1 vol. 8vo, full morocco, $12.

The practice of interleaving the Bible has never been more ingeniously carried out than in the plan developed by Messrs Bagster. In a volume of not more than ordinary bulk, beautifully printed in clear and legible type, we find the advantages above detailed united in a manner highly valuable and practically useful. To the Biblical student, and especially to the clergy, this Bible must prove of the highest value. The blank pages are ruled with faint lines printed at the back of the text on the left-hand page."—*Church of England Quarterly.*

"Among the many forms of beauty under which the Bagsters send forth Bibles to the world, we doubt whether there has yet been one that has more happily united usefulness and elegance."—*Christian Times.*

"Simple as this contrivance seems, it does great credit to the inventive ingenuity of the publishers, in meeting the almost undefined wants of Biblical students, to whom this beautiful volume will form a priceless acquisition."—*Journal of Sacred Literature.*

THE WEEK IN TRADE AND FINANCE.

DECEMBER 22.

THE money market has remained quite steady, with rates ruling between 5 and 7 per cent. to borrowers in good standing offering desirable collaterals. At the Stock Exchange 7 per cent. gold was paid frequently, and even as high as $\frac{1}{32}$ commission overnight was exacted, in some instances, in addition to 7 per cent. interest; but lately Stock Exchange rates have not fairly represented the money market, as there are quite a number of persons in that institution who are not considered desirable borrowers, and have to pay well in order to make up their bank accounts.

Commercial paper has been in very good demand, and the tendency of the market is towards lower rates. For first-class names 9 to 12 per cent. is a fair quotation. We hear that considerable amounts have been placed at the former figure, and holders do not seem to be desirous of selling at a much higher one. Several failures have taken place during the week among the dry-goods jobbing-houses, but they have occasioned no alarm, as they were houses of moderate capital and doing business of too extended a nature for their means.

The foreign news is unimportant. Money is easy in London, and the Bank of England rate of discount remains standing at 4½ per cent.

The weekly statement of the Clearing-House banks on Saturday was favorable; the total reserve shows a gain of $2,175,500, against an increase of $4,020,500 in liabilities—a net gain of $1,005,125 in reserve as compared with the statement of the previous week. The surplus reserve now stands at $11,245,125, against $10,074,750 December 13—a gain of $1,170,375.

The following is a comparison of the averages for the past two weeks:

	Dec. 13.	Dec. 20.	Differences.
Loans	$254,520,600	$257,191,900	Inc...$2,671,300
Specie	22,319,500	21,987,900	Dec... 331,600
Legal tenders	42,060,600	44,567,700	Inc... 2,507,100
Deposits	190,054,200	194,116,500	Inc... 4,062,300
Circulation	27,167,200	27,125,400	Dec... 41,800

The stock market has been very unsettled during the latter part of the week, with prices lower on the entire speculative list as compared with the quotations of Monday. It is but natural that a reaction should take place after the rapid advance since the panic, and a great many have doubtless thought best to sell and realize their profits. It is stated that a leading operator has been a heavy seller of stock bought at "panic prices," and is just now interested in bringing about lower quotations in order to buy back. We see no reason why stocks should fall off much below the figures reached on Friday and Saturday, unless the present policy of the Treasury Department suddenly changes, or Congress should do what it is the least likely to do—make provision for the immediate stoppage of the issue of irredeemable paper money. The investment stocks have been strong; New Jersey Central sold at 102 for odd lots, Delaware and Lackawanna at 102¾, Harlem at 121, extra dividend of 4 per cent., Ft. Wayne at 90½, and Michigan Central at 75½.

Railroad earnings for the first and second weeks in December are encouraging to stockholders, showing an increase over those for a corresponding period in November.

The following shows the highest and lowest sales of the leading stocks at the Stock Exchange for the week ending December 20, 1873:

	Monday.		Tuesday.		Wed'day.		Thursday		Friday.		Saturday.		Sales.

Government bonds advanced early in the week in sympathy with the rise in the gold premium. Later in the week, with the culmination of the bull movement in gold, the price of bonds declined about 3 per cent. on the most active issues, the market on Saturday finally leaving off as follows:

U. S. 6s, 1881, r.....114⅛@116
U. S. 6s, 1881. c.....118½@119¼
U. S. 5-20 c, 1862.....112½@113½
U. S. 5 20 c., 1865.....113½@114⅜
U. S. 5-20 c., 1865, n.....116½@116¾
U. S. 5-20 c., 1867.....117 @117½
U S. 5-20 c., 1868.....117 @117½
U. S. 5s, 1881.....111 @111⅝
U. S. 6s, Cy.....112⅜@112¾

The highest point reached during the week was 121 for 6s of 1881; 116 for 5-20s of 1862; 117¼ for '64s; 117¼ for '65s, old; 119¾ for '65s, new; 120 for '67s; and 113¼ for new 5s.

In State bonds a more active business has been doing. Tennessees have sold freely at 81 for both new and old issues. We notice auction sales of the following Southern State bonds: South Carolina 6s, act of March, 1869, at 10⅝ to 10⅞; South Carolina old 6s, dated 1855 and 1858, at 25⅜; and North Carolina Special Tax bonds at 6½ and 6⅞.

Gold advanced on Tuesday to 112⅝, at which figure the clique commenced selling out, when the price fell off to 111⅝, and on Saturday to 110⅛, closing at 110½. It is said that the clique, which was instrumental in advancing the market, succeeded in selling out at and above 112.

CORRESPONDENCE.

The Fire at Eatontown.

ITS PROGRESS ARRESTED BY THE BABCOCK ENGINE FROM LONG BRANCH.

LONG BRANCH, N. J., December 11, 1873.

F. W. FARWELL, SECRETARY:

DEAR SIR: We have received great praise for our company and the Babcock Engine for work done at a large fire at Eatontown on Wednesday morning. We received the alarm at 2 A.M., and ran to Eatontown (3½ miles) in twenty minutes; found four buildings about falling in, and Wheeler's large hotel on fire in a dozen places; owing to the high wind driving the flames upon the hotel, we were unable to save that, and directed our efforts to checking the course of the fire. We succeeded in doing so, saving a building within sixteen feet of the hotel; had this building burned, nothing would have saved the seven adjoining ones, as they are built close together, and probably the greater part of the town would have gone. The wind was blowing at a fearful rate, and we had a hot time of it, working about three hours. It is acknowledged on all sides that, but for the Babcock, Eatontown would now be in ashes.

Yours respectfully, F. W. KEMP,
Assistant Foreman Oceanic, No. 1.

Fire in Orange.

HASTINGS & BRUSH, 57 WALKER STREET,
NEW YORK, November 25, 1873.

F. W. FARWELL, SECRETARY:

DEAR SIR: I take great pleasure in informing you that by the use of one of your Babcock Extinguishers, I saved my house in Orange, N. J., from destruction last evening. The fire was caused by the explosion of a German student's lamp, which was being filled carelessly while burning. While I was up-stairs after the Extinguisher, which I purchased of you in May, 1872, and which was filled and set away at that time, and had not been touched since, an attempt was made to quench the fire by the application of pails of water; but the result was only an increase of the flames. By the use of the machine the fire was put out in less than five seconds, and the damage done, aside from the total destruction of the lamp, was very small indeed.

As I think the size I have is too heavy for my wife to use in my absence, I wish you would send me one of your smallest size. You may freely refer to me any parties who are at all doubtful of its utility.

Respectfully yours, CLINTON E. BRUSH.

THE BABCOCK MANUFACTURING COMPANY,
Manufacturers of Improved Fire Apparatus of all kinds—Engines, Extinguishers, Tanks, Hook and Ladder Trucks, etc.,
407 *Broadway, New York.* | 83 *Washington St., Chicago.*

INDEX TO VOLUME XVII.
